TERMS ONE DOLLAR PER YEAR.

FRANKLIN, DUNCKER, N.Y.

ADVERTISEMENTS.

We require that every advertiser satisfy us of responsibility and intention to do all that he agrees, and that his goods are really worth the price asked for them.

Rates for Advertisements.

All advertisements will be inserted at the rate of 20 cents per line, Nonpareil space, each insertion. 12 lines, Nonpareil space make 1 inch. Discounts will be made as follows:

On 10 lines and upward, 3 insertions, 5 per cent; 6 insertions, 10 per cent; 9 insertions, 15 per cent; 12 insertions, 20 per cent.

On 50 lines (½ column) and upward 1 insertion, 5 per cent; 3 insertions, 10 per cent; 6 insertions, 15 per cent; 9 insertions, 20 per cent; 12 insertions, 25 per cent.

On 100 lines (whole column) and upward, 1 insertion, 10 per cent; 3 insertions, 15 per cent; 6 insertions, 20 per cent; 9 insertions, 25 per cent; 12 insertions, 33½ per cent.

On 200 lines (whole page) 1 insertion, 15 per cent; 3 insertions, 20 per cent; 6 insertions, 25 per cent; 9 insertions, 30 per cent; 12 insertions, 40 per cent. A. I. ROOT.

**HEADQUARTERS FOR
Early Italian & Cyprian Queens.**

Imported and home-bred; nuclei and full colonies. For quality and purity, my stock of bees can not be excelled in the United States. I make a specialty of manufacturing the Dunham foundation. Try it. If you wish to purchase Bees or Supplies, send for my new Circular, containing directions for introducing queens, remarks on the new races of Bees, &c. Address
DR. J. P. H. BROWN, Augusta, Ga.

RUBBER STAMPS

DATING, ADDRESSING, BUSINESS,
LETTER HEADS, ETC.

No. 1.

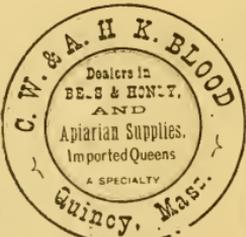

No. 3.

Address only, like No. 1, \$1.50; with business card, like No. 2, \$2.00; with movable months and figures for dating, like No. 3, \$5.00. Full outfit included—pads, ink, box, etc. Sent by mail postpaid. Without ink and pads, 50c less.

Put your stamp on every card, letter, paper, book, or anything else that you may send out by mail or express and you will save yourself and all who do business with you "a world of trouble." I know, you see.

We have those suitable for Druggists, Grocersmen, Hardware Dealers, Dentists, &c., &c. Send for Circular. A. I. ROOT, Medina, Ohio.

No. 2.

Cash for Beeswax!

Will pay 32c per lb. cash, or 34c in trade for any quantity of good, fair, average beeswax, delivered at our R. R. station. The same will be sold to those who wish to purchase, at 38c per lb., or 45c, for best selected wax. A. I. ROOT, Medina, Ohio.

P. S.—Unless you put your name on the box, and tell how much you have sent, I can not hold myself responsible for mistakes. It will not pay as a general thing to send wax by Express. A. I. ROOT.

BARNES'

Patent Foot and Steam Power Machinery. Complete outfits for Actual work-shop business. Lathes for Wood or Metal. Circular Saws, Scroll Saws, Formers, Mortisers, Tenoners, etc., etc. Machines on trial if desired. Descriptive Catalogue and Price List Free.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with * use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

NOTES FROM THE BANNER APIARY.
No. 50.

THE "OTHER SIDE" OF BEE-KEEPING, ONCE MORE.

MAY as well own up, that in comparing bee papers with other journals I forgot the agricultural papers. To some this may appear strange; but it is strictly true, and I hope no one will doubt my word. I am also forced to admit, that the agricultural papers do contain accounts of extraordinary yields from small pieces of land; but it does seem to me that they do not go at it in such a glowing, bubbling, booming, enthusiastic, all-carried-away, never-know-a-failure manner, as do the bee-journals; besides, they tell us that we must not expect such large yields from whole farms. I believe that the bee-journals also mention the same thing, sometimes, but they never seem to dwell upon it with any great degree of fervency. All I ask is, that both sides of bee-keeping be faithfully pictured. After I engaged in bee-keeping, so many friends said to me, "Why don't you go into the poultry business, too?" that at last I began to think quite seriously of doing so, and I finally sent for a book upon the subject. Well, this book pictured both sides of the business so faithfully, that I not only decided not to go into the business, but I sold what few hens I did have, and I have been thankful ever since. I haven't the slightest doubt but that money has been made in the poultry business; but I am also just as certain that it has a dark side, and I do feel grateful toward, and I respect, the man who had the courage and good sense to write upon the subject without "puffing" it.

When we think of the poor seasons; of the wintering losses; of the eruptions and boils, the partial paralysis of the nerves of motion, the inflammation of the breathing-tubes, eyes, ears, and throat, that come upon some of us as the result of taking into our systems so much bee poison; of how, even yet, many of us, in order to sell our honey, are obliged to go "hawking" it about; we can not load up and drive into any large town and sell our honey, at a regular market price, for "cash down," as we can butter, eggs, wool, grain, hay, potatoes, beef, pork, or almost any other imperishable product; and last, but by no means least, when we think of how that dire scourge, foul brood, is developing and spreading in many parts of the country; when we think of all this, even the most sanguine bee-keeper must admit that there is a dark side to the shield, and a decidedly dark one; and all that I ask is, that when the dark side begins to show itself, no hand be raised to turn it back again.

Perhaps I may as well right here explain the "concluding thought" of my report of the Chicago convention, as given on page 747. The idea that Mr. Langstroth meant to convey was, that with box hives and primitive methods, no skill nor knowledge was required; all that was necessary was to live the swarms, and, in the fall, brimstone the lightest and heaviest stocks. With improvements in hives came improvements in methods and implements; and with these came the need of extensive knowledge upon the subject. Without this knowledge, these improvements were worse than useless — they were detrimental; while to the man who knew how to properly use them, they were an advantage, en-

abling him to get large quantities of honey very cheaply, as compared to what could be done with the old methods. The farmer was not long in discovering that he could buy his honey more cheaply than he could produce it; he could not afford to buy improved hives, honey-extractors, smokers, honey-knives, comb foundation, section boxes, fountain pumps, bee-veils, etc.; fit up a place to keep and use them in, and learn how to use them, all for the sole purpose of caring for a few colonies of bees, and then be bothered with them right in his busiest season—haying and harvesting—not he; he could buy his honey cheaper, and, like a sensible man, he dropped bee-keeping; the specialist picked it up, and, with each year, it was becoming more of a specialty; in fact, it was rapidly becoming a scientific profession.

In thus writing upon the other side of bee culture I do not wish to be understood as discouraging people from entering our ranks; but in coming I wish them to come with their eyes open, with a full understanding of the difficulties they will have to encounter; then when the disappointments come they will not be so bitter. Instead of wishing to drive everybody out of bee-keeping, I have a genuine love for my brother bee-keepers; in fact, some of them have been so kind to me that I not only feel grateful toward them, and would do almost any thing to help them, but I have a real, downright, heartfelt love for them; but I must say, that I take more interest in making of bee-keeping a safe, pleasant, and profitable pursuit, than I do in leading others to become bee-keepers, by continually holding up to their view the bright side of the business. For instance, I take pleasure in telling bee-keepers

HOW TO GET PURE SUGAR.

In the Remindery for November, page 588, you say: "Now, if we shall succeed with these natural stores, after having failed so many times with granulated sugar, do not say it was because natural stores are better than sugar, but rather because we doubted them up until every colony was a powerful one." When I read this I could not help wondering if you had not before doubted up colonies until they were "powerful," given them natural stores, and then lost them; and furthermore, I wondered if you knew that all granulated sugar is not pure cane sugar. Within the last month I have conversed with a candy-maker who has had more than 30 years of experience, and he told me that granulated, coffee A, confectioner's A,—in fact, all grades of sugar,—can be, and many times are, adulterated with glucose or grape sugar. That adult-rated sugar sometimes has a bluish cast; that the "motion" of the sugar as it is handled will sometimes enable an expert to detect adulteration; that in some grades of sugar the glucose can be seen, but that no man can look at sugar and tell positively whether it is pure. He said that in buying granulated, or confectioner's A, the chances of getting pure sugar were greater than in buying other grades; but there was no absolute certainty. In making some grades of candies, absolutely pure cane sugar was required, and for this purpose they bought confectioner's A, but often found it adulterated, and it was only by experience that they had learned that certain refiners could be depended upon to furnish them pure sugar; in other words, they had to depend upon the honesty of the refiner. In making many grades of candy, glucose was used; and pure sugar could be mixed with a certain per cent of glucose and have it "work;"

if too much glucose was added, the candy was a failure. They could always tell how largely sugar was adulterated by the amount of glucose that it would "take." They never could tell, to an absolute certainty, that sugar was pure, until the candy made from it was poured out upon the marble slab, and work was commenced upon it. I told him the object of my conversation, and for what purpose I wanted pure sugar, and he said, "If you want pure sugar, I can get it for you, because there are two firms, or refiners, whose sugar we have used for years, and they can be depended upon every time." Do you see the point, my friends? If you wish for pure sugar, go and have a candid talk with a candy manufacturer; for if anybody knows where to get pure sugar, he does. But you can not always depend upon granulated sugar, as I have a friend who fed some to his bees in the summer time, and it killed them by the thousands. If the sugar that your bees had, friend Root, when they died, was adulterated with glucose, it would explain why they died, as glucose is so largely composed of vegetable matter as to be a poorer winter food than even poor honey.

W. Z. HUTCHINSON.

Rogersville, Mich., Dec. 15, 1883.

Friend H., I, too, think it would be wrong to induce people to go into bee culture by presenting them the bright side of it; but I can not think your criticisms on our bee-books and bee-journals are very well grounded in this respect. I can not remember of ever reading any book or journal that urged people to go into the business. A book on bees or a book on poultry should tell all that people want to know on the subject, so far as they can, and I do not now think of any books that do not give cautions and warnings. On page 284 of the A B C book I have not only given you the worst side of bee culture I ever knew, but I had our artist make a picture, to show what our friends might expect occasionally. It is true, our books and journals do not represent the industry as one that won't pay expenses in the long run; for if such were the case, there probably wouldn't be any books or journals very long. What is the matter with you lately, friend H.? You have not got astray into bad company, have you? Here is something that I clipped from an address of our mutual good friend Prof. Cook. I suppose everybody knows that it is always safe to bring any thing in that friend Cook ever wrote or said:

EXTRACT FROM AN ADDRESS BY PROF. COOK.

Another fallacy, as I think, which some few of our apiarists are loudly proclaiming, is that apiculture is only for the specialist. Why, gentlemen, our brothers in horticulture and agriculture are free to admit that they owe more, in the way of real progress and advancement, to amateurs than to specialists. I know that apiculture is no exception. Our honored guest was an amateur when he conferred the greatest boon upon our art. Long, Demaree, Clute, and a host of others of our best bee-keepers, are amateurs. I am free to say, that three-fourths of the honey product of our State is produced by men with whom apiculture is only an avocation. I can name a score of bee-keepers, whom I know personally, who are farmers, lawyers, doctors, who keep hundreds of colonies of bees, and many of whom not only get large returns of honey, but winter each and every year with entire success. When our specialists are all equally successful, then they may cry hold enough! with more justice.

An indication that the new recruits in apiculture will exalt rather than degrade the business, is seen

in the fact that many are calling for instruction in this line. Few studies at our Agricultural College win more earnest study and real enthusiasm than does entomology, which embraces quite thorough instruction in apiculture. Last year we had a student from England, and this year one from Texas, who came especially for the bee culture. The fact that Messrs. Jones, Haddon, and Clute, have respectable classes, shows that there is a call for more knowledge. We can but wish God-speed to all these gentlemen in their efforts. Special training is most desirable to the would-be apiarist. To be with such efficient bee-keepers for a season will give a vantage ground that can hardly be appreciated till enjoyed. The practical apiarist will be more proficient if he has had the science of entomology and physiology, and other cognate studies; but if he can not, because of age or circumstance, take so much time, let him by all means study and work for a season with some good apiarist. Such a course will never be regretted.

Now just a word about the sugar. I have never yet seen any granulated sugar that was adulterated with grape sugar. It could not be adulterated with glucose, because glucose is a liquid and *always* a liquid. I presume you know I am at home in this matter, and have always proved my position. There are two kinds of sugar prominently known in chemistry—grape sugar and cane sugar. We get pure cane sugar from sugar-cane, beets, maple-trees, and other sources. It is easily procured chemically pure from any of these sources, by its well-known property of crystallization. If you buy a jug of maple-molasses, and keep it any length of time, you will find crystals of pure sugar, or rock candy, on the sides of the jug. By washing these crystals you will have sugar chemically pure, without any maple taste about them. The same kind of sugar can be produced from beets, and recently from sorghum sugar. No matter what the source, it is the same—white, hard, dry, and sweet. Now, if any other substance can be found possessing all these properties, it might be used to adulterate pure cane sugar. Grape sugar comes nearest to it, but grape sugar does not crystallize. Cane sugar always crystallizes, or forms rock candy, as it is called. Coffee A sugar may be adulterated with grape sugar, because it is sometimes more or less moist; and a fine hard quality of grape, grated into it, might not at once be detected. If mixed together, it is not a very hard matter to separate them. Dissolved in water, cane sugar will form crystals, while the grape sugar will get hard, like tallow, as it were. Granulated sugar, at least the kind we buy, is formed of dry hard crystals, or little bits of rock candy. With a magnifying-glass it looks exactly like lumps of rock candy. If grape sugar were grated up and put into it, it would look under the magnifying-glass like little lumps of tallow, and it would stick the grains of cane sugar together, something as lumps of tallow would; so that, instead of running like sand, it would set together in lumps, as coffee sugar and brown sugar do. Now, it may be they have invented something to put into granulated sugar that I have not seen and do not know of; but if they have, I should be glad to see it. Please excuse me, if I once more suggest that, in writing about sugars, we bear in mind that grape sugar is a solid body, like lard, and is a liquid only when melted, as lard is; and that glucose is a liquid and always a

liquid. It may be made thick, by lowering the temperature, so that a saucer full may be inverted; but even then it is translucent, and not opaque, like grape sugar.

KEEPING THE BEES FROM SWARMING ON SUNDAY.

ARE WE AT PRESENT EQUAL TO THE TASK OF MANAGING THE MATTER?

FRIEND ROOT:—Tha. article in last GLEANINGS, from L. L. Langstroth, concerning holding back swarms for a day or so, or while at church, is worth many times the price of GLEANINGS, if it can only be made to work. I have repeatedly said that I would give quite a sum, if I could only control swarming without so much work, handling over the sections, and cutting out queen-cells, giving brood, extracting from the brood-chamber, etc. Either or all of the above remedies, when applied to a hundred swarms, as often as it is necessary to prevent swarming, is more than I want to do, especially while running for comb honey; and now I wish to give at least one reason why I am afraid that confining the queen will not be a success. The queen by no means leads out the swarm, and is many times among the very last to leave the hive; now, my opinion is, that the bees will swarm, even if the queen is confined. There would be no great harm in this, if they would only return to their own hive; but my experience is, that with hives sitting six feet apart, the bees, after circling in the air, very often return without their queen, to some neighboring hive, and especially might this be the case should two or three swarms issue at the same time.

Now, friend Root, if there is any thing in the above that you can make use of, do so; I do earnestly hope for some such simple remedy or prevention of swarming.

FUEL FOR SMOKERS.

Two years ago, if I am not mistaken, I told you to tell the brother bee-keepers to try toad-stools, and they do work remarkably well, and I had not a thought but that bee-keepers could get plenty of them, which it seems they can not do. Now, I have another article to offer, which I know that some of you can get in great abundance. It is the tassel from cat-tail flag. We call them cat-tails; get them before they get too ripe, and dry them thoroughly. Drop a few coals into the smoker; crowd in two or three of them, and you are loaded for a good long job. You would think the downy things would burn out quickly, but they will not, and do not blow sparks.

GEORGE H. SPRAGUE.

Haskinville, N. Y., Dec. 14, 1883.

FRIEND S., I think you are right, or at least partially right. Even if we do control the queen, and keep her, it is a pretty bad thing to have bees rumaging without the queen, and I have sometimes thought I would rather take the chance of letting the queen go along with them. The best safe-guard I know of against having swarms on Sunday is to take their honey away with an extractor; and if they get over-populous, take away some of their brood, or what amounts to the same thing, swarm them artificially. If one wants to raise comb honey, I know it is a little risky; but giving them an abundance of room in the sections, and keeping

the hives shaded, will perhaps go a good way toward discouraging swarms from coming out. After having done this, a Jones guard put over the entrance, to hold the queen, might be a pretty good thing. If they went off, we should be a queen ahead, any way.—Thanks for the suggestion on the cat-tail flag. There is plenty, almost everywhere, I believe.

HOW I USE SINGLE-STORY HIVES.

SOME GOOD SUGGESTIONS BY FRIEND POPPLETON.

THERE seems to be considerable interest among bee-keepers, concerning the use of single-story hives; and as I have used them quite largely for a number of years, I will try to tell something about how I use them—not theories about how I think they *ought* to be used, but just simply the details of the ordinary management of my apiary. Of course, I will not need to give the details of all the operations in the apiary—only such as concern the use of single-story hives. Neither shall I, in this, enter into any discussion whatever about the comparative merits of the single and double story systems, leaving all such discussion to take care of itself in the future.

I suppose it is generally understood, that single-story hives are almost exclusively used in the production of extracted honey; but I use them without any particular trouble in getting what little comb honey I do raise, usually using wide frames at the sides of frames, and a section-rack on top, being essentially the method used by Mr. Doolittle. Single-story hives were, I think, first described some 10 or 12 years ago by Gen. D. L. Adair, of Kentucky, and Elisha Gallup, of Iowa. These hives have been called by various names, such as "New-Idea" hives, "Long-Idea" hives, "long" hives, "horizontal" hives, etc.; but it seems to me that the term "single-story" hives is the most appropriate. Gen. Adair gave his hive the name of "New-Idea" hive; the idea, which was new, being to place the brood-nest in the back end of the hive, having the empty combs for surplus honey between the entrance and the brood-nest, the entrance being at the sides of the frames instead of at the ends, as is the ordinary practice. I do not know how largely this idea of Gen. Adair's has been tested, but I think very little, nor do I know how successful or unsuccessful that little has been.

I first made the long hives, essentially as I now use them, in the spring of 1872, the idea coming at that time from the pen of Mr. E. Gallup, of my own State. They are oblong square boxes, 40 inches in length outside measure, and just deep and wide enough to take frames 12 inches square, top-bars being 14 inches long. Bottom-boards are either loose or tight, as one may prefer. An entrance is cut in the center of the lower edge of the front side of the hive, $\frac{1}{2} \times 12$ inches, ordinary triangular blocks being used to control size of entrance. The frames run from front to rear, the number of them being graduated to suit season and size of colony, two division-boards being used close up to the frames, one on each side, the latter being kept as near the center of the hive as convenient. I first made the division-boards to fit tight, but found they were too much trouble to manipulate, so have of late years made all to fit quite loosely. I use altogether, double-walled

or chaff hives, the make of which is, of course, quite different from single-walled hives; but as the brood-chambers in both are essentially the same, I will not, in this place at least, give any description of the chaff hive.

SPRING MANAGEMENT.

As soon as weather becomes warm enough for bees to fly quite freely, usually with us from the 25th of March to the 10th of April, we overhaul and thoroughly examine every colony, cleaning out the hives, and noting on the outside of the hive its exact condition as regards health, quantity of bees, stores, and brood. This record is a guide for work until commencement of the honey season proper. During this examination all colonies that are weak in number are deprived of part of their combs, division-boards and cushions being closed up accordingly. All colonies that are short of stores are given frames of sealed honey, kept over for that purpose, and all queenless colonies are disposed of according to circumstances, usually by giving the strong queenless ones the queens from the weakest colonies in the yard, and destroying the weak queenless ones. I have entirely given up trying to unite weak colonies in the spring, as I can not see that the united stocks are materially stronger at commencement of honey-season than each of them would have been if kept apart. Much better satisfaction has resulted from keeping all the weak colonies that have good queens, and building them up by giving brood and young bees from the strong colonies. I feed bees flour every spring until natural pollen appears. I do not know that it is any material help to them, but it keeps them out of mischief, and allows of their being handled without serious trouble from robbers. To briefly summarize, our *early* spring management consists in seeing that every hive is thoroughly cleaned out, that each colony has ample stores of sealed honey, has a laying queen, and has all the space they can utilize, and *no more*.

Later spring management is devoted almost entirely to building up our colonies in readiness for the honey season. The best way of doing this is still one of the disputed points of bee culture; and while I do not think that I am surely right and others wrong, I do prefer and practice what is known as the "spreading-comb system." As soon as the bees are strong enough to cover more brood than they then have, usually the latter part of April or the first of May in this locality, I insert in the center of the brood-nest a frame or two of empty worker comb, doing this work as often as necessary, rarely inserting more than two combs at a time, oftener only one. I usually go over the apiary once a week, inserting combs in such as need it, a moment's examination of each colony being sufficient to allow one to determine what needs doing. This spreading of the combs I regard as one of the most particular operations of the apiary, and should never be practiced largely by any but the experienced bee-keeper. Too great caution can not be used by the beginner, especially if single-walled hives are used. In fact, I have some doubt whether I should practice this system at all, were it not for the aid of chaff packing and chaff cushions. This spreading is continued all through the season with such colonies and at such times as may be necessary, and is, in fact, the foundation of the method I use in increasing the number of colonies.

In making my increase of colonies I practice entirely what is known as the "nucleus system," mak-

ing my nuclei as early in the season as possible, and building them up during the entire season by giving them foundation, empty comb, or brood, from other hives, as they may need either. This is a much better plan than either dividing or natural swarming, as it allows of keeping the original colonies in strong populous condition, ready for any yield of honey when it comes. For rearing surplus queens for replacing poor ones in the apiary, I divide some of my standard long hives into three or four apartments by the use of tight-fitting division-boards, making small entrances to the apartments on different sides of the hive, and putting a two-frame nucleus into each apartment, using standard frames. By the close of the season, these three or four nuclei in each hive are strong enough to be united, and make one good strong colony for wintering.

As soon as white clover fairly commences to bloom, each colony must be supplied with from two to six more frames of empty combs. Some of these want to be placed at the side of the brood-nest; but I usually prefer to place as many of them in the center as it is safe to do.

As soon as some of the best colonies have about 25 or 30 lbs. of surplus honey in their hives I commence extracting. This is a little sooner than I would like to commence; but if the first of our extracting is done a little too quick, the last of it will be just as much too late; and if we keep anywhere near up with our bees, we are forced to start a little ahead of them. I do not know how other localities may be, but here we rarely ever see 30 lbs. of honey in a single-story hive without at least $\frac{1}{2}$ to $\frac{3}{4}$ of it being sealed over. O. O. POPPLETON.

Williamstown, Iowa, Dec. 10, 1883.

[Continued in our next number.]

SHIPPING-RATES OF FREIGHT ON EXTRACTED HONEY.

A MOVE IN THE RIGHT DIRECTION.

IN JUVENILE for December, page 776, Edwin France writes of his troubles in shipping honey by freight. We have been in the same "boat," and the way we got the matter righted may help him or others laboring under the same difficulty. Our railroad is the Milwaukee, Chicago & St. Paul, and their freight schedule puts honey as 1st class, which from here is 58c. per 100 lbs. to Chicago. Molasses goes as 3d class, at 35c. per cwt., and if in 20-bbl. lots, 4th class, or 30 cents per cwt. Until last year we always paid 1st-class freight; or if we shipped a large lot, the station agent telegraphed for special rates, and then we could get rates at 3d class. This was quite a gain, being 18c. per 100 lbs., which on a crop of 10,000 lbs. would make \$18.00 saved. But we could not always get the rebate, for sometimes we did not want to ship our whole crop at once, or to the same market; then we had no help, but had to pay the other 18c. and look happy.

Thinking there might be some way of righting this wrong, I determined to first try the general freight agent of the company; and then if that failed, to complain to our State Railroad Commissioner, for we have such an officer, whose business is to hear and adjust all differences. Well, I wrote a letter to D. W. Kyes, General Freight Agent, explaining the grievance, and also explaining the great change in manner of handling honey that had been made in a few years, stating every thing in as clear and com-

plete form as possible, and requesting him to consider the matter. By the very next mail, if I am not mistaken, came an answer, saying, "You can ship at molasses rates hereafter," and an order was issued to all station agents on their road near here to that effect. This year I wanted to ship about 5000 lbs. at one time, and a neighbor (S. I. Freeborn) wanted to ship part of his crop, so we made one shipment of the whole; and as it made over 20 bbls., we got 4th-class rates to Chicago, which is 30c. per cwt., or a saving of 28c. per 100 lbs., or almost half of old rates.

There is only one trouble now remaining; and that is, the printed schedules furnished for station agents remain the same; and if the agent forgets, or you forget and do not see *how* the honey is billed, there is a show for you to pay old rates. We hope to get that changed yet. C. A. HATCH.

Ithaca, Wis., Dec. 21, 1883.

REPORT FROM AN A B C SCHOLAR DURING HIS SECOND YEAR.

FROM 1 TO 21 (CYPRIAN), AND 123 LBS. OF HONEY.

AI ROOT:—I shall now submit my second year's experience in the bee business: For an A B C student, I did much better than I expected. If the business holds out as well in the future as it has so far, I don't regret the time I have spent in the business. I commenced in the winter of 1882 with 12 colonies, which increased in the spring by natural swarming to 50. I put back 16 swarms, and two left for the woods. I have taken out 3000 lbs. honey—half comb, the other extracted. I sold down to 49 colonies in my home apiary. I have another apiary away from home that I worked for another man on shares, consisting of 39 colonies. As I took them late in the season, I got only about 400 lbs. of honey. All my bees are in good condition. I had one colony of Cyprians; the queen I got from Mr. E. T. Flanagan, in August, 1882. This colony was the first to swarm; it sent out a swarm the 18th of May, and about the last of May they sent out the second swarm, and they kept it up until they sent out four swarms, and would have swarmed again, but I prevented them. The first swarm from them swarmed three times, and the first from this swarmed twice. From this one colony they increased to 20, but made no honey from clover, but from fall bloom. I took from one colony 60 lbs. comb honey, and from another 63 lbs. of extracted. These were my best colonies. They would breed up a swarm while other bees in the yard would scarcely live. The imported queen and bees you sent me built up a strong colony, and are doing well. These are the principal points in my experience. I feel well satisfied so far, and have bright hopes for the future. C. M. DIXON.

Parrish, Ill., Dec. 24, 1883.

Why, friend D., your figures almost take away one's breath. I thought when friend Bliss, on page 21, reported 14 from one, and 200 lbs. of honey, that it was almost too large a story to put in print; but you come backing him up with 21 colonies from one, and 123 lbs. of honey, without mentioning a good deal more that you did not tell of. No wonder you feel satisfied. Perhaps it won't do any harm to whisper to our readers, that along with his report friend D. asked for an estimate on a carload of supplies for the sea-

son of 1884. Now, I can hardly think that our raw recruits will all expect to do as well as the above; but it demonstrates this: That there are possibilities in bee culture that none of us yet dream of; and even if some do make a start, and in a little while get discouraged and disgusted, it does not alter the facts given above. One more thing is coming out stronger with the wonderful reports we have had in the few days past; and it is, that with these modern improvements and appliances one may commence with scarcely more than a single colony, and close the season with a large apiary, and tons of honey. Our readers who care to, may find friend D.'s report of his first year with bees on page 9, 1883.

JONES'S ZINC HONEY-BOARD.

ADDITIONAL FACTS FROM ACTUAL EXPERIENCE.

I AM glad to see Doolittle comes to the front with Jones's honey-board, for it allows the criticisms of lesser lights with a little more grace. We, too, have had an experience with them; but after your indorsement of them, we were afraid to offer our objection.

Last spring we purchased two, at an expense (by the time we received them) of about 90 cents each; and when our hives were ready for surplus, we adjusted them to two hives for extracting, by simply removing the mats, and putting on the zinc, and then the second story full of foundation, or empty combs. In about a week we opened the hives to note result, and imagine our surprise to find the queen above, busily at work. We then moved all the brood below, together with the queen and all the bees; readjusted the zinc honey-boards with great care, filled up the second story again, and waited another week, when, to our disgust, we found both queens above, and hard at work as at first. We then removed the D. A. Jones honey-boards, and laid them upon the shelf, where they have had a peaceful rest.

It is just as well to say, right here, that these queens are hybrids, and are large and prolific. But our conclusions were about as follows: The zinc honey-boards may do well for queens that are not as prolific as we have usually found the hybrids to be; or they may do for a hive that is so constructed that the brood-chamber can be enlarged to suit the capacity of any queen, without disturbing the surplus arrangement. But we are of the opinion, that, if the zinc board is the only obstacle in the way of the queens entering the surplus, and she takes a notion to go in, she will go. We are also of the opinion, that a wooden honey-board, an inch thick, with the same size of holes, is better for excluding the queen from the surplus arrangement, for it is very evident that a queen will readily pass through a hole in a sheet of zinc, when she would fail in the attempt to get through the same size hole as long as her body. If you entertain doubts, try the experiment yourself. Cut two holes; one in an inch board that will just allow you to pass through by twisting your shoulders; and one the same size through a wall that is about as thick as your body is long, and then see if you don't abandon the second hole before you get through.

It occurs to me that the entrance-guard for exclud-

ing and exterminating drones, is a good thing; but with the knowledge of the queen's powers of diminishing her size almost at will, and on short notice, in order to accomplish her purpose, we can not have much faith in them for retaining her in the hive to prevent swarming; and our faith in them for that purpose—although we have not tried it—is less since our experience with the honey-board.

Kirksville, Mo.

J. D. PEARCE.

Friend P., we are much obliged for your testimony, although I am considerably surprised at it. I confess that I have always been a little skeptical in regard to devices of this nature for restraining queens, for the same thing was tried pretty thoroughly when we tried them for fertilization in confinement. As several reports appeared, however, during the past season, showing that they answered the purpose of keeping the queen below, I had begun to settle down to the belief they did so, and I still think that many queens would be hindered by their use.—I have no faith at all in wooden separators for retaining queens, and not much for keeping out drones either; but I believe the perforated metal is a sure thing on *drones*, at any rate. Please let us bring facts forward, dear friends, with kindly and friendly feelings. Don't let us be in haste to "sit down hard" on anybody, even though their experience has been much different from ours. A good deal more charity won't hurt us.

FURTHER PARTICULARS FROM FRIEND HOBLER'S GREAT YIELD OF HONEY.

SEE P. 712, NOV. JUVENILE.

MR. ROOT:—You request me to give a detailed account as to how I got so much honey from my bees. The bees deserve all the credit. Had I done my part properly, I should have had nearer 4000 than 3000 lbs. In the first place, I let them make lots of brood in the upper boxes; and when I found that, I cut out enough capped brood to make several swarms, and made the poor bees fill up again with honey, which they did after awhile. Then some of my first caps had too small openings for the bees; and after wasting a good deal of their time, I gave them fresh caps, with large openings, and they went to work at once. Then again I was delayed for sections, and by bad luck, so that I could not always attend to them when I should.

With all natural swarming, as mine was, there was much loss of time from many swarms having only virgin queens, and in ways which all bee-keepers understand. They were originally Italians, but are now nearly all hybrids, which I think are the best for comb-building. I used only starters, even in the bottom boxes, so they had all their work to do.

Most of the farmers around here have from 2 to 20 swarms, and raise honey for their own use. It is worth about 8c. per lb. here, but if in good shape, double that in San Francisco. We use four sections to a cap, each section having 8 frames; and when full, weighing from 12 to 14 lbs. A filled cap holds 50 lbs. of honey—a convenient size to handle. I believe this has been a very good season for honey; but if all goes well, I will make a report again next year.

GEORGE HOBLER,

Hanford, Tulare Co., Cal., Dec. 4, 1883.

MAKING HONEY SELL.

Some very Sensible Facts and Suggestions from a Good Sensible Man.

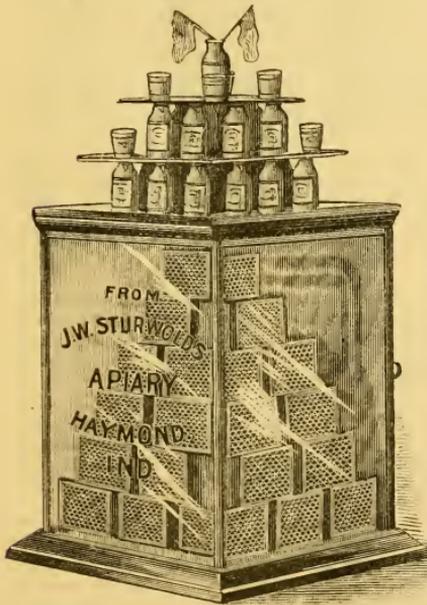

THE WAY FRIEND STURWOLD FIXED HIS HONEY IN A GROCERY STORE.

FRIEND ROOT:—So many of your correspondents are giving their plans for selling their surplus honey, through the columns of GLEANINGS, I will give you mine, and the way I created a market at and near home.

In former years I had trouble to sell my surplus honey at a live and let-live price at Brookville, the county-seat, on account of the farmers selling their dark strained honey at 5 or 6 cts. per lb., and comb in broken pieces smeared all over with honey, from 6 to 8 cents. I could not afford to sell mine at those prices, and therefore had to ship it to large cities, and I lost considerable by its being smashed while in transit.

I had often noticed, that if goods were placed in a show-window, or fine show-case, they would sell faster than when laid on the shelves; and the thought came to my mind, that if the pretty white sections filled with snow-white capped honey were put in a show-case, and set on the counter in a conspicuous place in a leading grocery, they would draw the attention of the customers, as well as other goods.

I at once ordered one made, 2½ ft. high, by 16 in. square at base and top, three sides glassed, and the fourth side a panel door painted a sky blue; on the pane opposite the door I had the inscription in gilt letters, shaded brown, as in the cut.

STURWOLD'S SHOW-CASE FOR HONEY.

I made arrangements with one of the leading grocers to have the case put on his counter, allowing him a commission of 20 per cent on all he sold. I filled it with one and two pound sections, arranging

them in the shape of a cone, the 2-lb. sections at the bottom. On the top of the case I put 12 2-lb. jars of extracted honey, arranged in a square, and above them 8 1-lb. jars, with a pane of glass between them, and one jar on top of that, with a few ¼-lb. tumbler on each corner. All the jars were labeled, and capped with tinfoil caps, *a la* Muth. This pyramid of jars was covered with fine white mosquito-netting, to keep the flies from soiling the labels and jars.

Friend Root, it looked pretty, and made me feel happy when I heard the grocer exclaim, "Well, well! if that won't sell, Mr. S., I'll give up the grocery business." Do I hear you ask if it did? Well, I should think so. In six weeks all my comb honey, 350 lbs., was gone, and he wrote me for more. You see, if we put our honey up in an attractive manner it will sell, and that at a good price too. I sold my comb at 20, and extracted at 15 cts. per lb. The honey placed in and on the show-case was not handled, for I furnished him enough in the shipping-case.

Haymond, Ind., Dec., 1883.

J. W. STURWOLD.

Friend S., I do not wonder a bit that your honey was all sold; in fact, you have mapped out the way to sell any thing you want to sell; and not only do such neat exhibits sell the honey, but they make a business-place look pleasant, and make life pleasant as well. I especially admire your suggestion in regard to keeping flies off the bottles with mosquito-netting, although I would suggest pink instead of white. We place to your credit a five-dollar bill for your article, and the photograph you send along with it. By the way, friends, don't you think our engravers did pretty nicely on that picture right up there? I do; and I hope they will feel happy when they take a look at it, and see what I have said about them.

MICHIGAN STATE CONVENTION.

Feeding Extracted Honey Back to Get Comb Honey.

ALSO SOMETHING ABOUT PERFORATED ZINC HONEY-BOARDS.

THE following we clip from the proceedings of the convention at Flint, Mich. As both subjects have been considerably before us of late, the matter will likely interest all of our readers:

W. Z. Hutchinson being called upon, he read his report from GLEANINGS. He, too, had had a poor season; but as he had mentioned incidentally that he had practiced "feeding back," it brought down upon him a shower of questions. In feeding back 1000 lbs. of extracted honey, he had received 800 lbs. of comb honey. Had tiered up the cases of sections until they were three or four cases high. Had fed the honey as fast as they would take it. Looked the sections over about once a week, and removed the full ones. Some colonies did much better work than others. After the first trial, selected the best. No honey was coming in at the time of the feeding; did not weigh the hives; weighed only the sections and the amount fed. He had a friend who had fed back upon exactly the same plan, but his friend had not found it profitable. He thought that to know just how to feed back, at a profit, was not yet positively known.

D. A. Jones: The question of feeding back has but few advocates, for the reason that the majority have failed to make it profitable. To be successful in feeding back there must be no place in the hive in which the bees can store honey, except in the sections. Those hives must be selected that contain the most honey, or else those having but few combs. My plan of feeding is to elevate the hives in

front, and pour the feed in upon the bottom-board. The bees do not carry the honey out of the hive; they must store it somewhere. Bee-keepers fail to make it pay, because the bees had an empty brood-chamber. Section boxes filled with fdn. had been given a colony at 9 A.M., feeding commenced, and the next day, at evening, the bees had commenced capping some of the sections. Fifty-two lbs. of honey was f'd, and 44 lbs. of comb honey obtained. To get unfinished sections filled, and at the same time have the honey removed from some other unfinished sections, I put the sections that I wish emptied, over the hive, and the ones that I wish finished, in the main body of the hive, keeping the queen out of them by using perforated zinc.

W. Z. Hutchinson: Will not pouring in honey at the entrances incite robbing?

D. A. Jones: I do not pour it in at the entrance. I pour it down inside the hive at the back.

W. Z. Hutchinson: You speak of using perforated zinc. I should like to know something about that. Do the bees work through it freely? Is there any objection to its use, except its cost? and where is the expense? is it in the material, or in the preparations?

D. A. Jones: It is in no way detrimental. The bees work through it freely. I see no objection to its use except its cost, and its cost is in the preparations. Tin would be no cheaper, for the reason that it comes in smaller sheets, and the waste would be greater.

C. F. Muth: Mr. Jones sent me some perforated zinc. I thought there was more than I should ever sell. It was all sold long ago, and I have since then sold large quantities, and my customers are well pleased with it. They tell me that the queens never pass through it.

Rev. L. L. Langstroth: I tried experiments, years ago, to determine if there was a space through which the workers could freely pass, and the queen could not. I found that space to be 5-32, through which not even a virgin queen could pass—her shoulders, or, rather, the thorax, preventing her. The great difficulty in my experiments was, that the wood would shrink and swell and warp, and the bees gnaw off the corners, making the space wider. Had I had the modern perforated zinc, I should probably have made of it a practical success.

W. Z. Hutchinson: I have used honey-boards the past season, made of wood, the slats of which were 5-32 of an inch apart, and they answered every purpose, and are cheaper than zinc.

Rev. L. L. Langstroth: Do they not shrink and swell or warp, and do not the bees gnaw them?

W. Z. Hutchinson: No, sir. They are held in place by strips of tin, and are painted.

S. T. Pettit: I can hardly think the wooden boards would be better than the zinc. It would take some time to make them, while the zinc is all ready, and so lasting.

W. Z. Hutchinson: The wooden boards cost only a third as much as the zinc, and I prefer them.

ANOTHER REPORT, BY W. Z. HUTCHINSON.

The following report from friend Hutchinson was received after the above was in type, and hence we give both. There seems to be a little difference between the two, relative to feeding back.

Oh for elbow-room! oh for the whole of GLEANINGS, in which to describe the glorious time we had at Flint! but as I am restricted to a page, I must begin.

FOUL BROOD

Probably never received a more exhaustive discussion, and that, too, by such men as C. F. Muth, D. A. Jones, T. F. Bingham, L. L. Langstroth, and Dr. A. B. Mason. There is a mild and a malignant type of the disease. Before brood is sealed, both kinds have nearly the same appearance; but, after the mild, or "Innocent" kind, is sealed over, if a comb is cut asunder, a watery substance runs out. That foul brood can be developed from decomposing brood was very positively asserted by some, and as strongly denied by others. Foul brood has been cured by salicylic acid, the starvation, and the cremation

methods. If but few colonies were affected, nearly if not quite every one was in favor of the cremation method. A comb containing malignant foul brood was on exhibition, and, as the same hands that handled the frame were afterward used in handling other articles on exhibition, I should like to ask if it would not be advisable for every one who brought any thing away from the exhibit to either burn or boil, or at least scald the article. The discussion upon

COMB FOUNDATION

Was prefaced by the exhibition of a Given press, and the making of foundation in the presence of the convention. The exhibitor, Mr. R. S. Taylor, preferred the Given fdn., because the base of the cells was so very thin, while the walls, receiving no pressure, were soft and easily drawn. The fdn. could be made directly into wired frames. Mr. VanDeusen, of New York, said that many objected to the flat-bottomed on account of its hardness; such should remember that the heat of the hive softens the wax. He did not think that the flat-bottomed fdn. was any more objectionable than the round cell of the Dunham. Mr. Jones said, that in order to secure even sheets of wax, the dipping-board should be reversed each time it was dipped.

WINTERING

Was discussed in much the usual way. There was talk about chaff hives, chaff and other kinds of packing, about temperature, dry cellars and wet ones, about ventilation, long confinement, not much about pollen, but a little about the importance of proper food. There was a great saving in food in cellar wintering, and Mr. Jones had had bees confined six months, and they came out in fine condition, looking as though they could bear six months' more confinement. Prof. Cook said that they wintered their bees successfully in a cellar, in which the water often stood eight inches deep, while Dr. Mason said that it was improper food that killed bees in cellar.

ARTIFICIAL PASTURAGE.

Sweet clover was decidedly the favorite plant to sow for honey alone. Dr. Mason said that it grew luxuriantly, even in the busy streets of Toledo, O., and one of his neighbors had received 1000 pounds of surplus honey from it, and it was gathered late in the season.

THE GENTLEST BEES.

Mr. Jones said that the Italians were more gentle than the Syrians, but that there was a difference in the Syrians; those from Mt. Lebanon being the most peaceable. He preferred the progeny of a Syrian queen mated with an Italian drone.

QUEENS MATING MORE THAN ONCE.

Dr. L. C. Whiting had seen queens mate more than once before beginning to lay. Mr. Langstroth had seen the same thing, but had always thought that such queens were not really and fully fertilized until the last time they flew.

EXHIBITS AT THE STATE FAIR

Were discussed in such a manner as to cause at least one exhibitor to feel the blood tingling in his cheeks—but not for shame, however. To revise our premium list, and urge its adoption for another year, the following committee was appointed: H. D. Cutting, Dr. Kezartee, Dr. Mason, Mr. Muth, and Mr. Jones.

"SEPARATORS"

Was the heading to an essay read by myself, in which I took the ground that they were useless, if

the following conditions were complied with: Have the sections less than 1½ inches in width, 1½ if possible; fill them with Given fdn., and have the surplus department well filled with black bees, or Italians having a dash of black blood. Some of the above conditions could be omitted, and fair success attained; but the nearer they were complied with, the more perfect would be the combs. I believe the discussion that followed sustained the position taken.

SELLING HONEY.

Mr. Muth had built up a large trade by selling only pure honey, and had induced manufacturers of tobacco and of cookies to use honey, as he also had the manufacturers of pork and pickles. Both he and Mr. Benham distributed cookies made with honey, which were very fine.

FEEDING BACK

Extracted honey to produce comb honey was briefly touched upon. Mr. Jones and myself were the only ones present who reported as having made of it a success. I tiered up the unfinished sections, in the Heddon case, until they were three or four tiers high, fed the bees as fast as they would take the honey, and looked over the sections, and removed the finished ones about once a week. In feeding back 1000 lbs. of honey I had secured the finishing of 1200 lbs. of unfinished sections, increased their weight to 1900 lbs., and had left about 100 lbs. of unfinished sections. A friend of mine had "fed back" in exactly the same manner, but had *not* found it profitable. Thought there was yet much to learn upon the subject. Mr. Jones said that many failed to make it profitable because too much room was given in the brood-nest. The brood combs should either be few in number, or else filled with honey.

"IS BEE-KEEPING HEALTHFUL?"

Was one of the questions asked. Some had suffered from boils and eruptions of the skin, caused by bee poison. Dr. Mason had suffered from partial paralysis of the nerves of motion of his hands, and, in the fall, he felt pretty nearly "used up," as the effect of bee-stings. D. A. Jones had obtained temporary relief from rheumatism and neuralgia, as the results of bee-stings. Mr. Langstroth had suffered severely upon handling bees, after not having handled them for several years; but upon continuing to work with them, the trouble subsided. The remedies given for bee-stings are too numerous to mention.

PREVENTION OF STINGS.

Mr. Jones said that stings upon the hands and wrists could be greatly avoided by singeing the hairs from them, as the bees catch their feet in the hairs, become irritated, and sting. Smooth clothing, something like duck, was best; light-colored being better than dark. The best kind of a hat to wear is one of straw, with a wide slouching brim.

TO FIND A BLACK QUEEN.

Mr. Jones said: Shake the bees from the combs, letting them fall into the hive, and set the combs one side; then with a sudden jerk shake the bees to one side of the hive; and as they commence to spread out and run, buzzing for the entrance, the queen will come to the top, and start off with those long strides of hers, when she can be easily secured.

And now that we have Mr. Jones on the floor, why not let him tell

HOW TO REAR QUEENS?

By the addition of brood, make a colony extra strong. When the bees begin to seal the queen-cells, preparatory to swarming, remove the queen.

If they swarm before then, remove the queen and put them back. They will build an astonishingly large number of excellent cells. Just before the cells hatch, remove them, and return the queen. The bees yet retain the swarming fever; but having no queen-cells, and no unsealed brood, they will not swarm, but will wait for the queens to lay, and then rear queens under the "swarming impulse," and from the egg. A second large "batch" of No. 1 cells is the result.

There were many minor topics touched upon, but want of space forbids even an enumeration of them.

ELECTION OF OFFICERS.

The officers for the ensuing year are as follows: President, W. Z. Hutchinson; Vice-Presidents, R. L. Taylor, James Heddon, and B. Salisbury; Secretary, H. D. Cutting; Treasurer, T. M. Cobb.

PLACE OF NEXT MEETING.

The convention adjourned to meet in Lansing, the second Wednesday after the first Tuesday in Dec., 1884; and I hope, friend Root, that you may meet with us "next time."

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., Dec. 19, 1883.

And I hope so too, friend H.; and I should have been with you this time had I not been so foolish as to contract a cold so severe that starting off at such a time would hardly have been a prudent thing. Very glad to hear you had such a pleasant and profitable time.

WHY BEES CAN NOT FLY 90 MILES AN HOUR.

A SUMMING-UP OF SOME OF THE EVIDENCE, AS IT WERE.

MONTHS ago, when friend Shuck and I expressed a doubt about bees being able to fly 90 miles an hour, I was rather surprised at the interest the subject seemed to excite; and when it was claimed that bees might be assisted in keeping their position above a train of cars by the movement of the cars displacing the atmosphere, and causing a partial vacuum which the returning atmosphere, by its elastic nature, hastened to fill, our scientific friend Phin very properly remarked, that "arguing in regard to matters concerning which our knowledge is incomplete," is very apt to lead to error. He thought the idea of such a vacuum "must be very amusing to any one who has the most elementary knowledge of the laws which govern the motions of aerial fluids." And then friend Phin left us without another word about the "fluids," so that the most of us, doubtless, did not know where the "smile" came in. But Mr. Shuck subsequently "sat down so hard" on the 90-mile theory and friend Phin's philosophy, that probably they don't care to hear more about it. But I promised to have a talk with the young folks, and allude to the matter now in an introductory kind of way.

In this discussion on the wing power of bees, Mr. C. E. Chace, a bee-hunter, on page 443, August GLEANINGS, 1883, produces the only real statistics which were brought forward, and his timing bees when in the height of their work gathering honey, gives them a rate of speed of about a mile in five minutes; and I have carefully noted, that whenever bees have been actually timed by persons following them in swarming, or tracing them to their hives by marking and following them, that this is about the speed they make. All who claim 90 miles, or very

rapid flight for bees, have formed their opinions from observing their apparently rapid flight through the air. The eye is very deceiving; and when an object so small as a bee is watched, its passage through the air seems very rapid, while larger bodies appear to move slow, although going with great velocity. A bee, though moving through the air many times its length in a minute, moves no greater distance than a large animal; and, as all the real statistical evidence we have on the subject proves, not faster than an ordinary farm horse can gallop.

A bee is formed as a beast of burden, not for speed. It is broad, blunt, and strong. Let us inquire what was the design of the Creator in giving the world the bee. Fortunately, science has discovered the object of divine wisdom in this. Without bees to carry the pollen from flower to flower, many of the choicest fruits man enjoys would scarcely produce sufficient to maintain their existence. So also with the grasses that form our most valuable pastures. It requires millions of insects to accomplish this work, and it was therefore necessary that the bee should be endowed with instinct to propagate its kind rapidly, and with great power and industry to gather food to nourish the millions of young bees. Hence it is that the parent colony casts a swarm as soon as the family can spare it, and that swarm migrates a mile or two, when it makes a nest, and rears and casts off other swarms to do likewise. In the meantime, millions of flowers are opening on every side, needing the assistance of the busy insects to fertilize them, in order that abundance of fruit may be produced for the use of man and the lower animals.

Speed and carrying power are never associated in the same animal. The bee is essentially a creature of burden. Why should it be endowed with powers of speed to carry it 90 miles an hour? It has no use for such speed, and the Creator, who forms nothing in vain, has not given it speed, but a capacity to carry, and move comparatively slow. When friend Phin argues that a bee being able to carry a load of honey much greater than its own weight, when relieved of the load ought to increase its rate of speed in a corresponding ratio, he evidently ignores his own maxim, and it "must be very amusing to any one who has the most elementary knowledge" of the laws of gravitation, and the resisting power of the atmosphere.

E. E. EWING.

Highlands, N. C.

HALF-HEARTEDNESS.

ARE WE GUILTY OF SUCH SINS?

SOME months ago, at one of our young people's prayer-meetings, our pastor said that one of his greatest sins was the sin of half-heartedness; and then he gave a good talk on the subject, and I have not got over that talk yet, and I hope I may never get entirely over it. I had long been thinking there was a great trouble somewhere, and that this trouble was also a grievous sin with many of us; but I had not made up my mind just what to call it. I suspect that it is a very prevalent sin among bee-keepers, and one that brings about many grievous troubles. I know it does not belong to those alone who are working for somebody else; for farmers and others who are working

solely for themselves are guilty of this same sin.

Within the past few months I have been besieged by people, young and old, for a place in our new factory, to an extent that indicates a very great want among humanity in general; and I have been studying and praying over the means to meet this great want. Why are so many seeking employment? and at the same time they are thus seeking and pleading and begging for something to do, I happen to know that there is a great want, and a constant great want, or need, of competent men and women, for a thousand and one places in the duties of life. Why, then, can not this superfluity of labor fill the constant want for such labor? I suspect the trouble is the great and prevailing sin of half-heartedness. I was once inclined to think that the golden rule would prove a remedy for this half-heartedness; but when I discovered that those who work for me work with this same half-heartedness when they are working for themselves, I began to think that the whole trouble consists in a sort of mental laziness. When people find that they can get men or women who put their whole hearts in their work, then these men and women are in demand. Now, I do not want this paper to be a fault-finding one, and therefore I will take up some of the pleasant features of life, as well as some of the unpleasant ones that I am compelled to take up. Occasionally I have found both men and women here in the factory who seem to have a way of going into every thing with a whole heart. You doubtless know such people yourselves. Are they not pleasant to meet? They seem to have a sort of love for doing things well and accurately; and when they have made a mistake or omission, they are ready to make such a full-hearted apology that you are sometimes tempted to feel that the fault is perhaps fully atoned, or a little more, above what you have suffered from carelessness or neglect. I have mentioned some of their names in some of my writings.

When we were excavating our cellar, it was found necessary to have another scraper; and to get the dirt out of the way, it was necessary to have one at once. One of the men was about to be sent for it; but I told Mr. Gray that the directions were so very indefinite as to where it was to be found, that I feared they would not get it.

"Well, what shall we do?" said he.

I told him to send "Jacob." Jacob was brought forward, and told all we knew in regard to where he could find the scraper, and was also told the urgent need for one at once.

"All right," said he; "I will get it."

In a very short time it was on hand, and the dirt was being rapidly moved away. I asked him how he found it.

"Why," said he, "I just stopped and inquired at every house, after I got where you said, and kept going till I got it."

Now, that is one secret of why Jacob succeeds in almost every thing he sets out to do. He just keeps going until he gets it; and if men are waiting, he goes pretty lively too. He has been scolded sometimes for driving

the horse too fast, but he never drives the horse any faster than he goes himself, according to his strength. In our work here we constantly employ a messenger boy, as we call him. This boy goes to and from the postoffice, and executes errands of a similar nature. Once in awhile we have to change messenger boys; and although almost every boy thinks he can do it all right, I have learned by sad experience there are very few who will not make us much trouble. Our letters to go to meet each train are put in a special pigeon-hole. Now, it would seem a small matter to take all these letters to the postoffice; but I have learned by experience that a new hand will almost invariably leave a letter or a postal card or two in the box, and sometimes some very important matter is thus left over. Again, when boys go for the mail, our packages are put in a large tray, or, rather, on a table with boards around the sides. You would think anybody of common intelligence would take the whole contents of this tray when he had learned that it was for us, and of course much of it important and valuable. Well, a good many boys will leave part of this mail, instead of taking it all. Last fall a messenger boy would repeatedly leave queens lying in this box. His excuses were, they were up in one corner, and he did not see them.

Now, this is not confined to boys alone. A year or two ago I raised a pretty good crop of rye, which was harvested while I was away at our State fair. Although an old farmer was employed to cut the grain, he skipped quite a little piece of it that he forgot. The ones who tied up the bundles also left a swath alongside of the field, that they did not see. I sent them out to finish raking and binding; and then when they drew the grain into the barn, they left a couple of shocks of grain that they did not see. The team was hitched up the second time to go and get them. After all, on looking over the work, several bundles were left scattered about the field until they were spoiled by the rain. Now, this work was done by three or four different individuals—those who were brought up on a farm too. It not only taxed my brains to look after them, and to pick up after them, but it discouraged me in my life work of trying to furnish employment for those who were constantly begging for it. I was obliged to say to myself, "I shall have to give up. I can not undertake to set men or boys at work who will do their work in such a half-hearted way as this." Since then I have watched farmers, to see if they work for themselves in such slipshod, listless ways, and I am compelled to admit that they do. How anybody can labor hard to raise a crop, and then let it lie and rot, after all the labor has been expended on it, is beyond my comprehension. Machinery left out in the weather, going to ruin, is from the same piece.

Now, friends, lest you get an idea that this half-heartedness belongs to men only, I want to relate a little experience of yesterday. While reading the mail I ran on to the following:

Mr. Root:—I wrote to you something like a month

ago, for your terms on the Waterbury watch, series B, and have had nothing from you. Why is this? I know you used to be very prompt to answer. Please give me the very best on the above watch in quantities, in at least ½-dozen lots. I have just received a ¼ dozen from New York, and have disposed of them at a profit, and will await your answer before I make my next order, as I have always found your prices as low as the lowest.

Your old customer,
JNO. S. COOPER.

Goodbar, Tenn., Dec. 10, 1883.

As soon as I got part way through, I spoke to one of the clerks: "Why, this letter came over a week ago."

I was assured that it did not; but I remembered feeling a little indignant to think that a request for prices had been overlooked in that way, and also that I carried it to the clerk who sends price lists, that it might have immediate attention. As she was absent, I put it under her weight. How did it come that it was delayed a week after so urgent an appeal for just common business courtesy? It came about this way, as I found after some questioning. As the man does not ask directly for a price list, the clerk who mails them carried it to the book-keeper, to ask if that letter belonged in her department. The book-keeper glanced over it hastily, and decided that another clerk had better answer it. This other clerk was behind with her work, so it was given to me to read over again, to decide who should answer it, and here it was four or five days, after our friend's pathetic appeal—not even a price list sent him!

I do not know but I shall wound here in what I am going to say; but the wounding will be like pulling the sliver out of your finger. It may hurt more than to let it alone; but it will make the finger better eventually. Through all my business experience there have been complaints almost constantly from people, saying that they have asked for price lists, and asked for them repeatedly, and yet they are not sent. Over and over again have I had the correspondence hunted up, and the matter investigated; and it almost always results in showing that the clerk overlooked the request for a price list, or forgot to send it, or did not know that it came in her department, and such like excuses. I use the pronouns *she* and *her* because all this work is in the hands of the girls. It is not only young girls, but women of all ages, who are guilty of this kind of half-heartedness. Our price lists are gotten up with great pains and much expense. We pay hundreds of dollars yearly in advertising, that we may get applications for price lists. Several thousand dollars are also yearly expended in printing and arranging the names of those who want price lists; and yet after all this plowing and sowing and harvesting and binding, the ripe grain is allowed to lie and spoil, because of the half-heartedness of the clerk who importuned for something to do. I am glad to say, there are some exceptions to this. I know of a few girls who, the minute their eye had caught the contents of the letter I have given above, would have sprung from their seats, gone to the large basket of price lists, picked one up and addressed it, and put it in the

mail-bag, with an expression something like this: "There! that man will get his price list this time, I'll bet, for I addressed it to him myself, and I know it is addressed correctly."

Right here, friends, let me remind you that clerks who do this (and who listen attentively to every expressed want in any letter, and who make it their business to scan the letter through, even though it be a long one, and see that every expressed want has attention) command large wages; and one who throws his *whole soul* into his work, and seems to have a sympathy and love for every customer intrusted to his care, I can afford to pay twice or three times as much as for a half-hearted or indifferent clerk. While going over the ground, it almost seems as if this sympathy and love for those whom we meet in business can never exist without a love to Christ. Now, please do not think me complaining, dear girls, when I suggest what should be done in all similar cases. In the first place, all who read the above letter, no matter where or what part of the factory they work in, should have felt an anxious solicitude for the rights of a misused customer, and also for the reputation of the establishment where they work, and should have said within themselves something like this: "Now, I do not know just who should write to this man, nor what answer should be given; but I do know it can do no harm to give him a price list, and I will do that anyhow, and give the letter to Mr. Root when he comes in." It is true, if laid away until I came along, even though I did come in five minutes, the matter might have been forgotten; but even if it were forgotten, the man had the price list anyhow, and so he would know there was somebody alive and kicking still, at the "Home of the Honeybees." You may say that I ought to have a special receptacle for every thing needing direction from myself. Well, I have now a desk all my own, and I will at once have a weight put on that desk, under which all papers should be put requiring my immediate consideration. The clerk who opens the mail has such a weight, and I glance at it so often that my eye catches every letter within at least half an hour after it has come from the mails. I know, friends, that I am guilty of the sin of half-heartedness, and I am going to try to do better. Just another illustration:

A few weeks ago I wanted some eyelets for our loom. I gave a young man a bundle of strips of leather. Said I, "Take these to the shoe-shop, and have metal eyes put in each one, just like this old one I give you, only have them a *size larger*." To impress it on his mind, I gave him a knotted string, and told him the size must be large enough to let the string through, knot and all. When he brought them back, the eyelets were exactly like the old ones, and he admitted that he only told them to make the new ones exactly like the sample. This sort of work, as you may know, is not confined to boys alone, for we have men and women, many of them who want work too, who will do just half of what they are told to do, when the latter half is by all odds the more important part

of the instruction. You may say the instructions were too long — that they can not remember them. But, dear friends, the result is about the same when the instructions are in the form of a letter, in black and white, and I am sorry to say the instructions sent here are sometimes filled in that very way. We have tried clerks, and a good many of them would fill half an order, and skip the other half. What shall be done for half-hearted people? I have sometimes remonstrated in this way: "Dear friend, how would you feel, if, having sent your hard-earned money to somebody for a book, he should put it up for you in such a half-hearted way as to send you a dictionary when you wanted a book on bee-keeping? or suppose you sent for a smoker and the A B C book, and the clerk who got your letter should send the smoker and then distribute your letter, forgetting all about the book, that you wanted ten times more than the smoker?"

"Why, Mr. Root, I suppose I should get pretty mad."

There I had the frank admission, and yet this same individual might go on doing the same thing again. What shall be done with them? I have sometimes felt, when contemplating this kind of work, oh for more of the spirit implied in those beautiful words from our Savior, "Thou shalt love thy neighbor as thyself"! The one who did these things admitted she would get pretty mad, if used as she had used others, and yet this same person went on in the same way. Please do not accuse me now, my friends at a distance, of keeping clerks in responsible places who exhibit daily this half-heartedness. Of course, they have to be told very soon that I have nothing for them to do, unless they improve. I do not want this piece altogether a sad one, and therefore I thank God that I am able to tell you that the boys and girls, and men and women, can be cured of this grievous sin; but as with the sin of intemperance, I have been led to feel that almost the only real radical cure is to become converted. Becoming converted, in the popular acceptance of the term, does not always cure one at once of all these things. But any man or woman who is seeking counsel from God day by day, and toiling patiently and earnestly every day heavenward, will surely get the better of these evil habits. But many of those who seem pretty well along in the Christian life have a great battle to fight right here. A real, earnest, and vehement desire to do unto others as we would that others should do unto us, will effectually kill out half-heartedness in handling the property and business of others; and a desire to honor the name of our Lord and Master will kill out the disposition to be slothful and improvident about our own work. A good friend of mine once said he thought one great secret of my success in business, especially in employing so many hands, was my constant vehemence in saving every little scrap and odd or end that could be utilized in any way. My friends, are you among the half-hearted ones of this world? If so, I want to tell you, "Seek first the kingdom of God and his righteousness, and all else shall be added unto you."

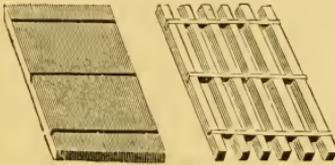

FEEDERS AND FEEDING.

SOMETHING OLD ABOUT AN OLD SUBJECT.

WE see a great deal said for and against the various feeders now in use among the beekeepers of this country. It is said, "Necessity is the mother of invention;" and as it was necessary for us to feed about 25 or 30 colonies of bees, we must have feeders; and as we could not make the bread-pan feeders work satisfactorily, we made, from half-inch basswood, some small boxes, 6x7 inches, and of different heights, from two inches to six, having floats to drop in the box on the honey. We have not had a bee drown with them; and as they take the honey from the shallow ones much the faster, we would recommend them to be made two inches deep. The matching may be made honey-tight by coating with paraffine. We made the floats by taking a piece of 3/8-inch board, cutting it about 1/4 inch shorter than the inside of the feeder, then cutting three or four cross cuts in it 1/2 inch deep, like Fig. 1, and slitting it then in 1/2-inch strips. Space them 1/2-inch apart, sliding 1/2-inch strips in the saw-cuts made, which should fit snugly, to make them keep their places, and then we have a float looking like Fig. 2.

Fig. 1.

Fig. 2.

HOW TO MAKE FLOATS FOR FEEDERS.

These feeders are equally good for water, but of course should be made larger for that purpose, and painted inside.

The honey crop for Saratoga County is exceedingly light this year, being about two-thirds that of last, as far as heard from. White clover gave us some honey and plenty of swarms, but the cold dry weather of August cut off our buckwheat harvest, almost entirely, so that swarms that issued in June were fed this autumn to prepare them for winter.

Saratoga Spa, N. Y. J. J. HOLLENBECK.

Friend H., although the plan you give for making a feeder is not new, still, as you present it, it seems to me it is worthy of consideration again. The objections to a box with a wooden float have been, that the floats get lost and broken; the box leaks after a while, in spite of paraffine, and it also gets soaked up with honey, and smells nasty. But perhaps all these defects might be remedied where one is careful, and sets them away when not wanted, as you do doubtless. One other objection to a deep box is, that while bees are feeding they generate an enormous quantity of heat, especially when they begin to secrete wax. If they are down in a box, this heat, or want of air, sometimes stupefies and kills a great many. By making the box one or two inches deep you will obviate this trouble. Such a feeder works very nicely when they are clean, and every thing is just right, and I do not know after all but it is about as good and sure a way as any. The Simplicity feeder amounts to pretty much the same thing, while it never leaks, and does not require any float. The reason why

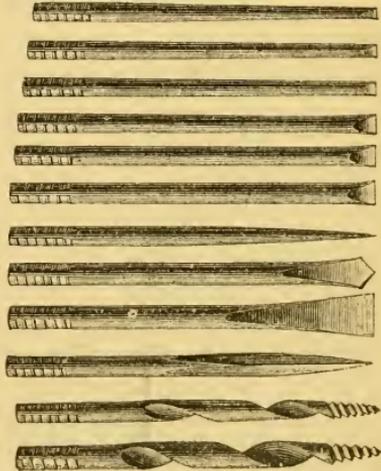

I use the bread-pan feeders in place of the Simplicity feeders is because they hold so much more, and because they cost so little.

A POCKET TOOL-CHEST.

MULTUM IN PARVO.

HOW often it is that one wants an awl, a gimlet, a small screw-driver, or a reamer to ream out metals! and unless these tools are kept and carefully put away, they are liable to be scattered and lost. To avoid having many tools scattered about, the Miller's Falls Co. have devised a little pocket tool-chest, shown here. To look at the number of tools shown in the cut, one would think that one handle would not contain them all. Yet it does contain them nicely; and besides that, it has in the end a very beautiful little chuck that will hold any one of the little tools exactly true and perfectly solid, and yet they can be exchanged in an instant. This tool-handle will also hold any other tool, or even a needle, or any shaped awl you may wish to use. As the handle is iron, it is strong and substantial.

We have made arrangements so that we can furnish them for an even 35 cents; by mail, 5 c. extra.

USEFUL TOOLS TO BE USED IN A SINGLE HANDLE.

MORE ABOUT THE HARDY STRAIN OF BEES.

SOMETHING FURTHER FROM FRIEND ROBBINS IN REGARD TO THEM.

FRRIEND ROOT:—After reading your criticism on my article, p. 741, Dec. No., it seemed to me that your remarks are calculated to create doubts and disbelief as to the hardness of this strain of bees; that the cause of success in wintering will, in all probability, be found in some accidental cause, and not in the bees themselves. Now, friend Root, this is the very question that puzzled me. I did not at first believe but that my own bees and others were just as good and hardy as Mr. Shirk's, and that they would winter just as safely under like circumstances. Now, I would say that, at that time I was just where you seem to be—on the other side of the fence of disbelief. But after an observation and experience of four years with these bees, during which time I embraced every opportunity to criticize Mr. S. and his bees, I found that he had the laugh all on his side, and the conceit most effectually taken out of me. Friend R, I can not ask you to devote space to a detailed account of the many incidents that have transpired in their favor in the 4 years that I have taken to investigate this peculiar trait; yet I do not, even now, say that this characteristic is a fixed and settled fact; but I do say, that the evidence and proof of 4 years of skeptical investigation show that our success was due to the bees, and not to any accidental cause. This being our deduction, I will add only my motive and reasons for making it public.

1. Believing, as I do, that this strain of bees possesses greater power of endurance in withstanding the rigors of winter.

2. That this superior power of endurance contributes to a greater wing power, whereby they are able to accumulate a greater amount of honey and stores.

3. That this same power, being constitutional, it contributes to a greater degree of longevity, thereby securing stronger colonies from the same amount of brood.

4. That the attendant loss of colonies during winter is one of the serious drawbacks to successful apiculture.

5. That, as it is a rule among apiarians to introduce new blood into their apiaries, for reasons that are obvious, that all who wish may have the opportunity of testing the prospective good qualities of these bees, and at the same price that would have to be paid for other strains of bees.

Bloomdale, O., Dec. 19, 1883.

R. B. ROBBINS.

Excellent, friend R. If you furnish your improved bees at the same price as the old ones, who will have any right to complain? They will certainly be worth all they cost; but at the risk of seeming perhaps unduly cautious, I wish to call attention to the fact that it will be a very difficult matter for you to keep this strain of bees from mixing quickly with other bees around them, and that it will be a very hard matter to hold them very long, unless you get queens constantly from one source. In fact, we could do comparatively nothing with the Italians, were it not that the yellow bands indicate where we are, and what we are doing. These remarks are made with the supposi-

tion that these bees are to the eye little if any different from ordinary Italians. Perhaps we may discover marks that will enable us to identify them, down through successive generations; but then, will these marks perpetuate the points we wish? It is true, we can rear our queens persistently from such colonies as seem hardiest and greatest honey-gatherers; but I know by experience that it is a pretty intricate matter to manage, so long as both queens and drones fly at least a mile or two in every direction.

SENDING QUEENS ACROSS THE OCEAN BY MAIL.

MORE ENCOURAGING FACTS.

OUR friends will remember, that in our last issue friend Benton made a proposal to those who would mail bees to him successfully. It seems that, in spite of my carelessness, the work was started after all. The following letter will be plain to our readers after what has been said on the subject:

Friend Root:—If the inclosed letter contains any thing of interest to you, or can be made to contribute to your valuable journal, it is at your service.

Huntington, N. Y., Nov. 20, 1883. F. W. BURGESS.

Mr. F. W. Burgess:—Success! The queen is yours! I am highly gratified at being able to report that *all three queens arrived alive!* Your letter mailed Oct. 15, arrived in Munich between 8 and 9 A. M. on the 27th, and was delivered at my house at 11 A. M. On the 28th (yesterday) the queens, mailed also Oct. 15, came, between 8 and 9 A. M., as the stamp shows, and were delivered at 11 A. M. I opened them in the presence of the postman who delivered the package. The following is the report:

No. 1.—28 workers; 8 dead and dry, not swollen. Two or three of the live bees with bodies slightly swollen; the rest, with queen, in fine order. Some flew out and tried to sting Mrs. Benton. Box not soiled by the bees. One holeful of sugar about half consumed. Other hole just begun.

Oct. 29th, 9 A. M., one more worker found dead. Oct. 29, 6 P. M., rest of bees and queens still lively. They have been given no other food than that in the box in which they came.

No. 2.—31 workers, 21 dead. Both living and dead bees completely daubed with honey, and the interior of the cage sticky. Most of the living bees were active, but two or three of them showing swollen bodies, yet could not fly on account of being daubed. But one or two spots were visible on the interior of the box. One hole of the candy was two-thirds eaten, the other still untouched. Caged her in a nucleus of Palestine bees, to see how she would appear after introduction.

No. 3.—40 workers. *Only one dead!* Queen and 39 live workers in prime order. Food about one-half consumed. Box clean. This box was opened before a closed window, and most of the workers had a cleansing flight. The queen also took wing, and alighted on the window, where she discharged a small quantity of fluid, a drop the size of three pin-heads, perfectly transparent and liquid. After removing the single dead worker and the loose grains of dry sugar, this box was mailed at 5 P. M. of the same day (28th) to Wiesbaden (Prussia), some 12 hours by

rail, with a request to return it by the next post, with a statement as to,—

1. Exact time of arrival.
2. Number of dead bees upon arrival.
3. Condition of live bees.

The boxes all contained considerable loose sugar; but as the wire cloth had but small meshes, little had escaped, I think, into the mail-bags. The weather is rather cold and damp here at most of the time. The mercury now stands (6 P. M.) at 45° Fahrenheit. During the past few days it has ranged from about 45° to 60° Fabr. in North Germany; that is, on the seacoast. Here it is colder, because we are nearly 2000 feet above the sea-level, and the Bavarian Alps southward from Munich are covered with snow.

Well, it is for you to say whether you will have a Carniolan or an Italian queen. As it is now so late, I presume you will not care to receive her until next spring, so I make no attempt to get you either sort this fall.

I have just completed an article detailing some of my experiments sending queens by mail. I intended withholding the matter it contains from publication for a time, but shall now send it to GLEANINGS, Mr. Doolittle's article in the October number of that periodical having decided me in the matter. The fact is, the cage of Mr. Doolittle is nothing more nor less than that used by me as early as 1880, in sending queens from Cyprus to England and Germany. The journey from Cyprus to England takes ten to twelve days, being nearly 3000 miles. By reference to the *British Bee Journal* for July, 1880, you will find an editorial description of the condition of the first queen which I ever sent on such a long sea-voyage, and the first, I think, ever sent successfully on such a journey by water; also an illustration of the cage. Then by turning to page 237 of the *American Bee Journal* for May 9, 1883, you will find further mention of my success in sending by mail from the east.

This year the first queen I tried across the Atlantic was early in June (as will be seen from the letter I have just written for GLEANINGS), and that queen arrived in fine condition—thus was the first to cross the Atlantic alive, I believe. June 27th a second was sent to the same address in Canada. No report has come from her, although everybody supposes that Mr. D. A. Jones, to whom she was sent, is greatly interested in developing any thing that may be of service to bee-keepers. Since then I have sent a large number of queens by mail to America, and have met with fair success—in some instances extraordinary success, even in getting them as far west as Illinois and Minnesota. The improved cage, which was perfected only toward the end of August, and which I consider superior, on the whole, to any thing I have seen, will be described, and likely illustrated, during the winter some time. I am not sure but that the "Good" candy may prove better than that I make; but for the present I can not decide, as there must be a further trial of it for these long journeys. Were it allowed to send *great numbers* of packages of bees by mail here I would send all queens to America in that way. But at present it is only a small number comparatively that they accept as "samples." I have called attention of the postal authorities to the matter, and may secure further privileges.

Before closing this already rather lengthy letter, I must take the liberty of calling your attention to the choice of imported queens I shall offer for 1884. The

following is the list, with prices, freight prepaid to New York City, and safe arrival guaranteed:

IMP. CYPRIANS AND SYRIANS.		Apr or May	June	Jul and Aug	After Sept 1
I. Finest selected queens, each	...	\$12 00	\$10 00	\$ 9 00	\$ 8 00
II. Fine prolific queens, each	...	10 00	9 00	8 00	7 00
III. Darker and smaller qs., each	...	8 00	6 00	5 00	4 00

IMP. CARNIOLANS AND ITAL'S.		Apr or May	June	Jul and Aug	Fall
I. Fine selected queens, each	...	\$ 7 00	\$ 6 00	\$ 5 00	\$ 4 50
II. Fine queens, each	...	6 00	5 00	4 50	4 00

IMP. PALESTINE, OR HOLY-LAND QUEENS.
Prices same as for Cyprians and Syrians. No III. grade offered.

IMP. HERZEGOVINIAN, DALMATIAN, ROUMELIAN, AND HYMETTUS QUEENS.
Prices same as for Cyprians and Syrians. None of the III. grade offered.

I recommend the first five races about in the order named, though, all in all, I find it a little difficult to say which should be *first*—Cyprians or Syrians; at any rate, one or the other of these two is the bee for the experienced (above all for the professional) bee-keeper; while for beginners, amateurs, and such as haven't steady enough nerves to manipulate Cyprian or Syrian bees; also for such as have a "mortal dread" of stings, and those who suffer extremely from bee-stings, the Carniolans are to be recommended. Cyprians and Syrians are undoubtedly the *honey* races par excellence, while Carniolans are the *gentlest* of bees, and possess at the same time the prolificness and honey-gathering qualities of Italians—are even *more* prolific than Italians, stick to the combs like Italians, defend their hives (when not queenless), and are equal to the black bees in comb-building, disposition to enter boxes, etc. Their faults are: Considerable disposition to swarm, which, however, can be greatly controlled, as is the case with other bees, since with them it depends more upon their management; second, the same disposition to rob which the black bees show, except that, when honey is to be found, they are not as bad as blacks in this respect. When made queenless they do not defend their hives as well as Italians, Cyprians, Syrians, or Palestines.

The bees sold in America under the name of Holy-Land bees have received, as you doubtless know, much praise and also much criticism. As two *distinct* races, having very different qualities, have been mixed and sold under the same name, this is very natural. It is none of my fault that this has occurred, for I have always marked all boxes sent out either *Syrrian* or *Palestine*, according as they came from north of the mountain-range extending from the Sea of Galilee to the Mediterranean (Mt. Carmel), or from the south side of this range. The latter are the *true Palestines*, or Holy-Land bees. They greatly resemble the Egyptians, being gray in color, though not fixed in type in this particular, some being yellower than others. They are prolific, defend their hives energetically, gather honey fairly, give much trouble on account of fertile workers, are in general cross—some of them being veritable little heathens to sting.

Of the four races mentioned last, I have only tried, practically, the Hymettus, or Greek bees (also called Cœcropsian and Attic bees). They are prolific, good

honey-gatherers, quite cross, but can be managed with plenty of smoke. Herzegovinian and Dalmatian bees I know by reputation, and am thus safe in calling them superior to common bees and to Italians. Of Roumelian bees, I know nothing; but as I have an opportunity to get some of them next spring, and having reason to hope they may have good qualities, I shall try them. I shall get only a limited number of the four races last-mentioned, but can supply any number of Palestines. I get Carniolans from Carniolan Austria, and Italians from Northern Italy, being personally acquainted with many of the prominent bee-keepers of each of these two regions. To secure Cyprians and Syrians of the very finest grades, and in large quantities, it is my intention to make a journey to Cyprus and Syria this winter. Leaving here in January, via Italy and Egypt, I expect to reach Cyprus by the latter part of the same month; and go thence to Syria. As drones fly in those lands in March and April, I expect to raise a hundred or more queens myself. Then I will also bring 75 or 100 full colonies with me when I return, which will be in April, by way of Greece and the Adriatic.

You are now entitled to a seven-dollar Carniolan or Italian. Should you wish any other sort of a queen you can exchange by adding the difference, if any. On an order for six queens I make 5% discount; for 10 queens, 10% discount; 20 queens, 12% discount; 40 queens, 15% discount. Orders made now, and accompanied by the cash, by postal order, or by draft on Merck, Finck & Co., Munich, obtain a still further reduction of 10%. Thus; an order for ten fine Carniolans in May, prepaid now, will bring the cost of each one of the ten queens from \$6.00 each, down to \$4.86 each, the price for ten queens of this grade being \$51.00 in April or May, 1884, or 10% less now; that is, \$48.60.

When your bees came, Mrs. Benton remarked: "Well, there's a dentist with some ingenuity. If I were anywhere near him, I'd give him a job fixing my teeth." You see, the fact is, dentists this side the water are rather clumsy fellows, especially those in the far East, and we've both been obliged to let them "tinker" our teeth some; and in this, as well as in most other things, we have found it best to believe thoroughly in Americans, and in every thing American.

FRANK BENTON.

Munich, Bavaria, Oct. 29, 1883.

MARKETING EXTRACTED HONEY.

I HAVE had a little experience in selling, or, rather, trying to sell extracted honey this fall. In September I went to the city of Columbus, with a bottle of honey as sample, in my pocket, and thought I would sell some; but on asking the grocers if they handled it, a short "No, don't want to sell any more at all," would be the answer. "We have had some of it; but there has been or is so much stuff sold as honey, that people won't buy it at all." One man said that if the bees could not take time to put it in combs he didn't want it. At a few stores I found some put up in 1 and 1½ lb. bottles, but they said it was slow sale, and several times I was told, and with all candor, too, the old tale of the markets being hurt by the "artificial comb being filled with syrup, and sealed over with a hot iron, and selling it for honey." About the same time I sold a 10-gallon keg of pure clover

honey to a prominent grocer in Uhrichsville, and left a tin can for them to retail it out with. To-day I called to get the can, and was told that they could not sell the honey; that if they had not, they would not pay for it; that their customers said they did not like the taste of it, and after a little while it all turned to "sugar." Now, I told the dealer, when I sold him the honey, that he might tell each customer who bought it, that I would give \$25.00 to any one who would find any adulteration in it, and he did so, but it was no use. Now, how are we to educate such people, who can not tell sugar syrup from honey? You might put both before them, and I will guarantee they could not tell which was the honey. I have tried to work up a market right at home, by selling the extracted at a low price, 10 lbs. for a dollar, and the first cry was, "Adulteration!" for I could not sell pure honey at so low a price. Lord, help the ignorant people.

A. A. FRADENBURG.

Port Washington, Ohio, Dec., 1883.

ANOTHER CLOVER.

PEA-VINE, OR MAMMOTH RED CLOVER, AS A HONEY-PLANT.

THIS is a variety of clover that bee-keepers have generally overlooked in their search for a honey-plant to fill up the vacancy after basswood has gone, and before fall flowers commence. As I have had several good crops of honey from pea-vine clover, I will give my experience with it.

It grows and looks just like the common, or June red clover, only much larger and hardier, and it produces only one crop of blossoms in one season, and commences to bloom about the 15th of July, and continues four or five weeks right through the hottest, driest part of the year, when the bees have very little to work on, and it hardly ever fails to produce a fair crop of honey.

The cultivation is the same as common red clover, only the seed must be saved from the first crop; if it is intended for seed, it is better not to mix any other grass with it, as it will cover all the ground. The poorest ground you have is the place to sow it, as it will thrive on the poorest, driest soil, and mellow it, and fit it for another crop. When it is cut for seed about the 15th to the 20th of August, it leaves the land in an excellent condition for fall wheat, or a crop of potatoes the next season. I never had cut-worms, wire-worms, or white grubs injure a corn crop after clover. It is customary down east, where they wish to save the seed, to pasture it till about the first of June; but I have had better luck by cutting it off with the mowing-machine in the latter part of May, if it grew very rank. If the season is backward, I do not cut it off at all. It must not be cut or pastured after the stalk commences to joint or the blossoms form, or the seed will blast. In buying seed, be sure to buy of some one you can rely upon, as no one can tell by the looks the difference between pea-vine and common red clover.

I had 10 acres of pea-vine clover within 20 rods of 125 swarms of bees; they seemed to have about all they wanted to do; worked on it all day long for five weeks; bred up strong for winter, and filled their hives up full of the very choicest, whitest honey, and I got 40 bushels of nice seed.

Medina, O., Dec. 26, '83.

H. B. HARRINGTON.

I have for a long time felt pretty sure that,

with all our pains and trouble in rearing honey-plants, we many times get something not even as valuable to the bees as the ordinary red clover. I have seen the peavine clover Neighbor H. mentions, and it has always been full of bees — Italians, blacks, and bumble-bees. As the investment is a safe one (for the seed always pays all expenses of the crop), it seems to me it would be better for us to employ our time and money a little more in developing our red clovers. I suppose you can get the peavine clover in your own vicinity. If you can not, we can mail it to you at 35 cts. per lb., postage paid, or we can send it to you by freight or express for \$2.50 per peck, \$1.50 per half-bushel, or \$8.00 per bushel. We mention this because there are some localities where clover has not been introduced to any great extent.

BEES IN SEPARATE APIARIES.

From 260 to 529, and 23,000 lbs. of Honey.

REPORT FROM G. W. HOUSE FOR 1883.

AFTER filling our orders for bees, we had to commence the season with 260 colonies, all told (strong and weak ones). By drawing frames of hatching brood from the strongest, and giving to the lighter colonies, we had them all in about an equal condition by June first. We had an abundance of white-clover bloom; but owing to cold and rainy weather during the entire month of June, but little honey was gathered, and none at all stored in the sections. In fact, most of the colonies were in a starving condition when basswood bloom appeared; and with it a change in the weather. We were then confident that we should yet have a good yield of surplus honey stored in sections. Now for the results. At one apiary of 80 colonies, spring count, we made 105 new swarms, and obtained 9000 lbs. comb honey; at another apiary of 120, spring count, 118 new swarms, and 10,500 lbs. comb honey; at home apiary, of 60 colonies, spring count, 46 new swarms, and 3500 lbs. comb honey. In all, 269 new colonies, and 23,000 lbs. honey, all stored in the 2-lb. sections. We had no dark honey, the season being cut entirely off (for storing surplus) early in August.

To secure this amount of honey in that space of time, meant long days of hard labor, while the honey-flow continued. Of course, our work was lessened very much by use of our hives and surplus arrangements, which admit of easy and quick manipulation. I claim to have the simplest and best honey-rack in existence (or, at least, there is none better).

REVERSIBLE FRAMES.

After this season's work, I am convinced that the reversible frames will come into general use as soon as their simplicity and easy manipulations are understood, especially so with those who keep Italians, and work for comb honey; for extracted honey, they are no better than others.

My new method of rearing first-class queens, which has proved a perfect success this season, has also been a valuable feature in securing this amount of honey. It saves a great deal of time, which is very important at that season of the year. I may give you this method at some future time at my leisure. The bees are in fine condition for winter-

ing; they are mostly packed on their summer stands; have 100 in cellar; temperature stands at 52°; will keep it higher later in the winter or toward spring, and will report success.

GEO. W. HOUSE.

Fayetteville, N. Y., Dec. 10, 1883.

Friend H., your report is indeed wonderful; for we all know it is a far greater task to take 260 colonies, and make them average almost 100 lbs. per colony, spring count, than to do the same thing, or even double the amount, with a few choice colonies of bees.—In regard to that reversible frame, will you please mail us a sample, that we may have it engraved if it has not already been figured in our columns?

A GOOD REPORT FROM NORTH - WEST WISCONSIN.

200 LBS. OF HONEY AND 14 COLONIES OF BEES FROM A SINGLE DOLLAR QUEEN, IN ONE SEASON.

AS I see no reports in GLEANINGS from North-West Wisconsin, I will give you a few items from my apiary, it being my third year's experience with bees. I put into winter quarters, Nov. 3, 1882, 23 colonies, all fair to good; lost 6 in wintering and spring dwindling; sold one, leaving 16—4 very weak, 12 fair. Three of the weak ones gave no increase or surplus. Total increase, 47; nine of them double colonies. Being short of hives I doubled up the weaker swarms in swarming-time, instead of waiting until fall. Figures for honey stand: 725 lbs. comb honey, all in one-pound sections, and 1140 extracted, nearly all from half-frames put on top of the hives, *a la* Dadant. Our honey the past season was all white honey, only sufficient fall honey to keep up brood-rearing.

My bees boiled over so fast during the last part of June and the first part of July, that I was reminded of the Growler column; but the hybrids were ahead. I had one hive of hybrids which originated from a dollar queen procured of A. I. Root in May, 1882. It showed its first swarm May 29; June 9 it swarmed again. I then cut out all the queen-cells left; but in July it gave me two swarms more, making 4 swarms; the swarm that came out May 29, which I call No. 2, swarmed four times; the swarm that came out June 9 swarmed four times. The first swarm from No. 2 swarmed twice, making 14 swarms from one. I also got a little over 200 lbs. of honey from them—60 one-pound sections; many others partly filled, and 140 extracted; the extracted was all taken from the old swarm or hive. Now, let us see the money products of that one swarm. Say 14 swarms at \$5.00 per swarm, would be \$70.00; 200 lbs. honey at 1¼ cts., \$25.00; total, \$95.00.

As I am a boy, only sixty-seven years old, I will submit a conundrum: Was or was not that queen that went out with three swarms the mother of four generations—grandmother and great grandmother as well? Z. BLISS.

Lucas, Wis., Dec. 11, 1883.

Friend B., I do not know but that friend Hutchinson and some others will pitch into us again, for publishing big reports; but I for one am glad that we have positive proof that bees may do well in your locality. The credit of the dollar queen does not belong to me, I think, for we sold perhaps ten times as many as we raised ourselves. If you intend to submit the conundrum to myself, I think I should say you did have four generations of bees from your dollar queen.

Heads of Grain, From Different Fields.

TARRED PAPER FOR REPELLING THE BEE-MOTH.

I HAVE a little experience to relate in regard to preserving combs from the ravages of the moth during spring and summer months. In the spring of this year I had probably eight or ten hives filled with combs taken from swarms which had died during the previous winter, and some empty combs besides, from which the honey had been extracted. These frames of empty comb were all kept in a warehouse used for storing sash, doors, blinds, and tarred paper. I examined these frames at intervals during the summer, but could never find the trace of a worm. From this I conclude that bee-keepers need have no trouble with old combs, if they keep in their vicinity some tarred paper, or its equivalent.

Adeline, Ill., Dec. 14, 1883. W. A. HARRIS.

Friend H., I am inclined to think your experience was more accidental than from the presence of the tarred paper, although the latter would be very likely to repel bee-moth as well as other insects. I have often seen combs left exposed in an open place such as you mention, without any detriment, during the warm season; but either the moth did not happen to find them, or else the combs were separated so that they didn't find a convenient lodging-place. It is to be remarked, that having the combs put a little way apart is a pretty sure safe-guard, while sticking them up one on top of another will be almost sure to have them converted into a mass of webs.

CASH WITH ORDER.

Friend Root:—I am in your A B C book; I also enjoy GLEANINGS, and have been but a few months in the society of "queens." It seems presumption, therefore, in me to advise or suggest to you who teach the thousands. Still, I am impelled to ask, why do you not adhere strictly to your advertised pay-down system, and save all of the W. W. Kessler and like troubles?
JOSEPH CADWALLADER.

Forsyth, Monroe Co., Ga.

Friend C., if I am correct, our price list states that we require cash with order from those with whom we have had no previous deal. Many of our customers are now personal friends whom we have known and traded with and corresponded with for years. In fact, we know them almost as you know old friends in your immediate neighborhood; and to refuse to accommodate them as neighbors should accommodate each other would be a pretty hard matter, even if it were right for us to do so. Again, the prices of many things are changing so much that the money sent is very often a little more or a little less than the price of the article. If a customer sends too much, to be sure we might return the balance with the goods; but a great many times they would prefer to have it placed to their credit. At some future time, if their money should lack a dollar or two, it would be pretty hard to refuse to send goods when they were urgently needed, just because the money was not quite enough. Bee-keepers are a friendly and neighborly sort of people, and it has seemed to me, aff-

er considering the matter 'carefully, there is no other pleasant way of adjusting business than to open accounts with those whom we know to be worthy of accommodation. Of course, this necessitates a vast deal of correspondence—the worst feature of the whole matter by far being to make those talk or write who won't answer postals of inquiry. I wonder if those who will permit us to write again and again without making any reply, realize the amount of trouble they cause by so doing. If we have other bee-keepers at the same postoffice, we have no recourse but to ask them if they know such a man. If there are none such, we have to write to the postmaster; and I assure you, friends, it is not a pleasant thing to do, to be obliged to ask your postmaster if he knows such a man as you are, and whether or not you are responsible. Once in a great while he says the person is dead or has moved away. But in the great majority of cases, the trouble is simply the disease of procrastination.

ANOTHER EVIDENCE IN FAVOR OF ABUNDANT VENTILATION.

I have wintered without loss for the last four years. My bees in single-walled Langstroth hives, with $\frac{1}{2}$ -inch pine honey-board, were placed on shelves in the cellar under my house, with the cover over the honey-boxes taken off, and left off the whole winter, from fall till spring. No honey-boxes were on, but the middle slot on the honey-board was removed during the whole time that they were in the cellar. From the middle of January until the middle of March my family were away from home all the time, and no fire built in the house during the time. I used to visit the bees every Sunday, and the mercury was standing at 32° with hardly any variation during that time. I should have been glad to have it warmer, but the bees came out all right as it was. There were openings at the bottom of the hives, in front and rear both.

NELSON HUBBARD.

South Strafford, Vermont, Dec. 8, 1883.

In the above case, you notice, friends, that the bees were saved by abundant upper and lower ventilation, even though their wintering cellar stood as low as the freezing-point. It seems to me it is now pretty well demonstrated, that abundant ventilation will enable bees to go through where they would at least have perished without it. Sometimes they winter when pretty closely packed, I know; but the evidence is altogether in favor of large entrances left open, holes left open above, or something equivalent.

SOME PLEASANT WORDS FROM THE A B C CLASS.

Friend Root:—You are interested, I take it, in the success of your A B C pupils, and I must tell you how well we prospered—for beginners. Two years ago we had a swarm of bees given us. During the following winter they nearly all died, so that there was but a mere handful in the spring. But we had the combs, and in this emergency we sent to you for the A B C book, a queen, and half a pound of bees. We followed your instructions implicitly, and in the fall we had six very strong swarms, with hives full of winter stores, and about 30 lbs. of surplus honey, and bee-keepers here say it was a poor year for bees. Our success this year has given us confidence in ourselves and our guide, and next year we mean to get

a lamp nursery, and some rubber gloves for the "guld wife," and see what we can do. It seems as if bees must do well in a country where they gather honey from the time maple blossomed until the first of November. There were but three days this summer that bees failed to find honey. We have studied the A B C until we know it by heart; and long may the author live and prosper.

Fairview, Dak. G. L. HUBBARD.

REPORT FROM PENNSYLVANIA; ITALIANS AHEAD
AFTER ALL.

Our yield is not very good; yet it may be fair, Pennsylvania not being a noted honey-producing State. We went into winter with 56 colonies; came out with 56. We commenced bee-keeping in the spring of 1877, through the influence of a sample copy of GLEANINGS; never lost a colony in wintering, although the winter of 1880 nearly depopulated a few. The present crop is 247 lbs. of salable honey, of which about 2000 lbs. is clover, the remainder apple-blossom, locust, poplar, and buckwheat. Number of stocks, 61. Our honey is very nearly disposed of, at from 16 to 20c per lb. The readers of GLEANINGS may remember my expressing my doubts as to the superiority of the Italian over the black bee. The experience of the last several years has decided that question satisfactorily to me, in favor of the Italian.

J. H. JOHNSON.

Middaghs, Pa., Dec. 10, 1883.

A GOOD REPORT, AND SOMETHING ABOUT PAILS.

I went into winter quarters in the fall of 1882 with 22 colonies; came out in the spring of 1883 with 12; mostly weak, and in bad fix from the effects of dysentery. I increased to 26 colonies, and got 2200 lbs. of honey. About 500 lbs. of it was in 1-lb. sections; the rest was extracted; about $\frac{1}{2}$ of my crop was fall honey, from buckwheat and goldenrod. It is the best quality of late honey that I have ever raised. My bees appear to be in better fix for winter than ever before. Those 2 and 3 lb. honey-pails you sent me are admired by everybody — especially the large pails. I see the grocery men sell about 3 of the large raised-cover pails, to one of the 2-lb. Jones pails. I don't want any more of the latter, as I don't think they are neat enough.

W. L. MILLER.

Chariton, Iowa, Dec. 7, 1883.

A QUEER FACT ABOUT BEE-STINGS.

A grandson got stung last summer near the eye, and could not have liniment applied (so thought), because so near the eye. It closed the eye several days, and nearly closed the other. In a few weeks after, he was stung on the great toe by a bumble-bee, and in a few hours his eyes were swollen nearly as badly as the previous sting. Perhaps you can account for it. It is rather strange to me.

HENRY BAKER.

Cromwell, Iowa, Dec. 19, 1883.

Friend B., I have often noticed this queer phenomenon, although I do not think that I have before seen it mentioned. After a bee-sting that has swollen considerably has got nearly well, or so that the one who was stung has perhaps forgotten all about it, another sting on another part of the body will cause the first one to swell again, much as it did in the first place. I presume it is because the poison goes so quickly all through the body; and where one part has been recently suffering from the effects of the poison, a very little more of the same or similar poison ag-

gravates the disorder. Sometimes a sting on the hands will cause a swelling on the face, or about the eyes.

HOW LONG WILL BEES LIVE IN A HIVE WITHOUT
CHANGING THE COMBS?

A few years ago I transferred a colony of bees for a friend, putting in the frames some very old and heavy combs. During a visit to them a few days afterward I noticed at the entrance an unusual quantity of debris from the old combs. On examination I found that the bees had torn down the cells on a great deal of comb, and some of them were busy tearing down the remainder, while others were equally busy rebuilding the cells with new wax, using the septum of the old comb for foundation for the new cells. This I think will explain why bees will live 20 to 28 years in the same hive, as mentioned by Benj. Veach on page 756, Dec. No.

W. L. MOORES.

Cyruston, Lincoln Co., Tenn., Dec. 10, 1883.

I am aware, friend M., that bees often tear old combs, and scatter the litter on the floor-board of the hives; and, if I am correct, the young bees especially are addicted to this kind of mischief, when they have nothing else to do — that is, when they get no honey, and brood-rearing is not going on vigorously. I have sometimes thought they tore it down because they were displeased with it, and again I have been led to think they did it without any particular end or object in view. I infer the latter, because they took this same old black wax and built combs of it again, as soon as honey began to come in so that they needed it. Combs are changed about almost incessantly, and they are tearing down and building up a great part of the time. If you wish to see how much of this work is going on, just set a little colony into a clean new hive, and see how much litter you will find on the bottom-board in the course of an hour or two.

FROM 16 TO 51, AND 3600 LBS. OF HONEY.

I commenced the season with 6 strong and 10 weak colonies; being reduced the lowest I have been for years; and if I had supplied all that wanted bees, it would have taken twice as many as I had left. I increased to 51, all of which went into winter quarters strong, and most of them with a surplus of honey. Five or six are short. I shall commence to feed some time in January. Extracted 2400 lbs., and took off 1200 in 2-lb. sections, making 3600 in all, besides a few partly filled sections.

W. H. BALCH.

Oran, N. Y.

There is a moral in the above, friends, and that is, that even if your bees die out so that you almost have to commence over again, remember that by skillful management your hives may be replenished wonderfully quick. Friend Balch promises to tell us how he did this, in a future communication.

WARM EIVES WITH LARGE VENTILATORS.

In December GLEANINGS, page 740, Mr. Hayes says: "What is the use of a warm house, if we leave the door wide open?" That called to mind what I used to think — "If a farmer has a double-walled, frost-proof cellar-wall, but by chance leaves the door and ventilator open at a zero freeze, his fruit, etc., will all be ruined." For many years, in winter, while I am in bed, the snow sifts in my face,

At 26° below zero I bounce into bed and cover over my head, but soon have to uncover my face. Why have good quilts on, if my face is uncovered? They are a necessity for comfort and health. The frost-proof wall is to keep above freezing in cellar; a good house (hive) with door open is to winter bees in safely; that is why so much writing and ado in the North, "to winter bees safely." How true your closing comment is on same page! The single-walled hive gets warmed up in winter or spring when the sun shines on it for several hours at a time; but how is it for several hours before the sun comes up, or when several windy and cloudy days come at a time? Again, if we have melting snow or rain and then it freezes ice an inch thick on hives and every thing else for days, as we get it here, what will you do? I have no chaff hives; but last winter I had 8 hives packed in chaff, entrance wide open 3x5 in., with a 2-inch hole in the bottom-board, straw under. I left them that way till in May, warm all around, and they did about as well in summer as any. Will heart's-ease honey granulate? E. PICKUP.

Limerick, Ills.

Who can answer about heart's-ease honey?

FOUL BROOD.

Foul brood seems to be threatening more trouble than it has ever made before. It has cropped out in several places during the past season. Many times it was obtained in buying bees—the person selling them being evidently ignorant of the matter, and the great harm he is doing. I am repeatedly asked what advice to give in the matter. I have a good many times referred the inquirers to friend Muth; but I fear we shall over-tax both his time and his patience. Here is a sample:

We bought five hives this spring, and this fall three of the five have foul brood. I have taken out 9 frames, and the young queens kept laying later than any of my others, 21 in all. What would you advise me to do with them? There are no other bees in the county, and I want to build up a nice little business; they are all stowed in a room with sawdust walls, or between the walls.

C. C. BRIGGS.

Will Mr. Muth be so kind as to tell our friend what to do, and thus answer a good many others?

ON WINTERING BEES.

Inasmuch as there is so much difference in localities in wintering bees as to the mode of preparing them for winter, I will give my plan and result in our locality.

WHAT I DON'T DO.

I don't unite weak colonies to make them winter better. I don't cut any holes for winter passages. I don't feed in the fall to stimulate breeding. I don't weigh their honey to see how much they have. I don't guess at what they have. I don't try to find out whether they have any. I consider that their business. I don't take off the honey boards. I don't contract the entrance. I don't disturb them after the honey season is over, but let them severely alone. Last, but not least, I never lose any worth mentioning. I wintered eight nucleus hives, the cold winter of 1880, with no protection except chaff on top, two in a hive, that came out the nicest of any bees I ever had. I winter in one-story Langstroth hive, single wall, nine frames. Winter on summer

stands. Before the honey season is over, when all of the brood is out of the outside combs, I take the two outside ones out, and put in division-boards. I don't do any thing more to them till after the honey season closes, which is about the first of October. Then I put chaff or cut straw on them, and let them alone. My bees always spot their hives some after long confinement, but I never lost any by it nor by spring dwindling.

R. ROBINSON, 121.

Laclede, Ill., Dec. 18, 1883.

PERFORATED ZINC.

Bro. Doolittle's experience with perforated zinc, or, as it should be put, D. A. Jones's plan of obtaining comb honey, reminds me quite vividly of my Waterloo, nearly ten years ago. The plan was identical with the Jones plan; only two comb-boxes were used, and I had to use slats instead of perforated zinc. That theory will do to dream over till such time as it may be tried, and no longer, unless the operator be more skillful than I. Once I had four brood-nests in the same hive, queen-cells in three, pollen in my boxes, and plenty of disgust plainly marked all over my countenance, when I had expected self-satisfaction to shine forth as a beacon to those who were less thoughtful than I. My hives are large, and the size is regulated by two division-boards. The width of my hive is 20 inches, length 20½ inches, depth 12 inches. When I wish to arrange for extracted honey, I spread the brood; that is, I place three frames of brood on each side of the hive outside, and fill in the middle with empty combs; now I am nearly certain to find queen-cells on one side or the other, within the allotted time, and have had the queen hatch, mated, and start on a race against the old queen for the middle of that hive. The same effect can be brought about by a similar use of brood in a two-story hive, especially if the close connection of the upper and lower frames is cut off in any way. I have no doubt but these extra large colonies and extra large yields are the product of more than one queen, resulting from some manipulation similar to the above. Certainly, if Bro. Jones can get comb honey by that method, he has a wrinkle or two that some of us don't know.

J. M. SHUCK.

Des Moines, Iowa, Dec. 21, 1883.

Now, friends, we have had two adverse reports in regard to perforated zinc; but if I am not mistaken, there are many others who will come forward and tell us how it is to be used. I am pretty sure there are a good many, at least among our Canadian friends, who have succeeded finely with it.—I, too, have often seen two queens in one hive, where, by some accident, the brood had been separated by two or more combs containing no brood.

THE FARMER'S MOST ACTIVE ENEMY.

The above is the way the *American Agriculturist* puts it; but I do not know but we might truthfully say, the bee-keeper's most active enemy, or even mankind's most active enemy. I always feel glad when I get a subscription for the above paper. The reason is, I am sure somebody is going to have some good done him. Here is an item under the above head we clip from their January number:

This destroyer of the farmer's hard-earned savings is on every farm, in every house, and never leaves us day or night, summer or winter. It damages at midnight, and destroys at noonday. The

marks of its teeth may be seen on the pasture fence, it is wasting the barn-sills, and pegging away at your sulky plow. Even iron and steel are not exempt from its ravages. The plow comes in from the field bright with use; next week it needs several hours of work and worry to make it scour. You lend your new bright handsaw to a neighbor, who kindly leaves it lying on the grass a night or two, and its condition when returned mars its usefulness, and lessens your faith in human nature. A careless farmer leaves his new mower in the field, or the fence-corner, until next summer, by which time this fell destroyer has damaged it one-third of its value. The sections are black with rust, the journals are all gummed, and the wood-work is penetrated and weakened in every part.

Those who have read thus far, will have recognized this enemy as rust, rot, or decay, the most active promoter of which is oxygen. This invisible gas forms one-fifth of the entire bulk of the air, and eight-ninths of the weight of all the water on the globe. While of the greatest value in the economy of life, it is also a destructive agent of the most untiring kind. Yet its ravages are easily checked in many instances. A thin covering of some oil will perfectly protect steel and iron from its action. A coat of paint good enough to keep water from soaking into wood, will protect it from decay almost indefinitely. In the far West, where building is somewhat more expensive than in the East, farmers are disposed to leave their farm-tools out of doors the year round. Such men are making a great mistake. If they are not able to afford shelter for their tools, they can buy a gallon of paint, which, if carefully applied to the wood-work, will go a long way toward protecting it from decay. It is certain, that if the farmers of any State would expend one thousand dollars for paint next year for this purpose, they would save ten thousand now likely to be utterly lost. If any one thinks this overstated, let him look around among his neighbors, and see the hundreds and hundreds of dollars' worth of machinery that is going to ruin from decay, which a little paint would prevent. Here at least in the protection of farm implements a penny saved is as good as a penny earned.

PROF. S. R. THOMPSON.

I do not just see where the paint is going to fix the handsaw so the neighbor can leave it in the grass several days; but for all that, the above item is a grand good one; and while I think of it, we can send our readers the *American Agriculturist* one year for an even \$1.25, if it will be any accommodation to you.

PLANTING BASSWOODS.

I made a mistake in the size of my basswood sprouts. Instead of from 8 to 15 inches, it should be from 1 to 3 feet, and "all orders to be in on the 1st of March" should be the 1st of April.

HENRY WIRTH.

Borodino, N. Y., Dec. 23, 1883.

Friend W., we correct your advertisement with pleasure; and if you will allow me to advise a little, I should recommend you to provide yourself with plenty of competent help to take up those basswood sprouts, and ship them; for if you can send out young basswood-trees at ten dollars a thousand, that will run from one to three feet high, you will probably find yourself with your hands so full of orders that you won't know what to do. I am very glad indeed that you can furnish them so cheaply. As you will observe, it is about half what we offer them for; and while I am about it, I want to say I have been very much troubled at the way the basswoods are being taken off, to make section boxes. Unless new forests are planted out, and that right speedily, our industry is going to receive one of the severest blows it ever had. You will see by reports that many of our bee-friends get more basswood

honey alone, than from all other sources. Now, this is a very important item. Planting out young forests of basswoods would fix the matter, without a bit of doubt, and the speculation will certainly pay for timber, aside from the honey. Who will make arrangements now to plant out basswoods? and who besides friend W. is prepared to furnish them? They ought to be shipped from a great many different points, to avoid heavy express charges from long distances. Now, then, young friends, you that are wanting something to do, and are spoiling, perchance, for an opportunity to raise honey-plants surely and safely, just go into the basswood business. If you look about you, very likely you can find young trees near home, and thus save the expense of purchasing and shipping, both. You will find them in almost any woodland where stock is kept out; for cattle and sheep will eat young basswoods almost as they would growing corn.

BANISHING BEES BY ACT OF LEGISLATURE.

In reading GLEANINGS, I see an article, page 774, Dec. No., entitled, "Banishing bees by an Act of the Legislature." This act is not the only one of the kind, as there seem to be other places where the wise (?) fathers or city councils ordered the bees to be removed out of towns, on account of doing too much damage on fruit-trees and grapevines. I refer to Mound City, Pulaski County, Ill. And this, in the nineteenth century! Very likely there is the same motive here as in the Monmouth County case—personal spite and enmity. M. R. KUEHNE. Cairo, Ill., Dec. 24, 1883.

NOT BY MIGHT NOR BY POWER.

I regret the spirit of the remarks of D. H. Tweedy on temperance, in JUVENILE, if I understand him right. Surely it is "not by might nor by power, but by my Spirit, saith the Lord of hosts." The Duke of Wellington said, "My lords, I have passed more of my life in war than most men, and I may say in civil war; and if I could avoid, by any sacrifice whatever—if I could avoid, even for one month, a civil war in a country to which I am attached, I would sacrifice my life to do it." HANNAH W. WILLIAMS. Springville, Linn Co., Iowa, Nov. 5, 1883.

FERTILIZATION IN CONFINEMENT.

Several of the friends are taking up this matter again, and among them our friend Good pencils on the margin of a postal card as follows:

I will next season have queens fertilized in confinement, and have it done successfully too. Now see if I do not.

When such statements come from such Good authority, it may be worth while to consider the matter a little.

A "STUNNING" REPORT FROM BEGINNERS.

My brother and I went into the bee business one year ago. We put in the bee-house 40 swarms; lost 13 and the rest were in poor condition; but we had a good season. We extracted 3000 lbs., and had 60 lbs. of comb honey, and increased to 42, all in good shape.

M. M. RICE. Boscobel, Grant Co., Wis., Dec. 8, 1883.

FROM 24 TO 49, AND 1745 LBS. OF HONEY.

Last fall we had 32 colonies of bees; lost 6 during the winter; two others were very weak. The past summer they increased to 49 colonies. They gathered 11 gallons extracted honey (which at 11 lbs. per gallon equals 121 lbs.), and 1624 lbs. comb honey in one-lb. sections, making an average of 67 lbs. comb and extracted honey together, gathered by each colony, or less than a fourth of what they did last year. We never saw our bees crosser than they were this summer; veils were indispensable.

Will bees pay in Southern Dakota? We had the pleasure of meeting your brother at his prairie home near Mitchell, D. T., on the 11th of Nov. I suppose you have had the same pleasure in Ohio ere this. We expect to make Dakota our home after a while, and will be glad to hear that bees do well there.

J. S. WILSON.

Penrose, Ill., Dec. 6, 1883.

My brother asked me the same question, whether we had many honey men in Dakota. For answer I referred him to our subscription list, where we have perhaps 20 or 30 names; but I believe we have as yet had but few reports from Dakota, and none that I know of particularly encouraging. Who can give us a good honey report from that Territory?

FROM 3 TO 7, AND \$61.90 PROFIT.

I commenced the season with one weak colony of blacks and one 3-frame nucleus, bought of E. T. Flanagan, which reached me May 11, and I increased it to 4 strong colonies, and it made 25 lbs. comb honey. The black colony increased to 2, but I got no surplus from it, and then I bought one swarm of blacks. I now have 7 good strong colonies, which I value at \$75.00, as I could have sold them for that. They cost me, including hives and all, \$16.35; and the honey, at 25 cts., \$3.25, which gives me a clear gain of \$61.90, which is quite a contrast with some old box-hive men who live in my neighborhood, who got no honey and very little increase.

Stoner's, Pa., Dec. 8, 1883.

P. D. MILLER.

DO TOMTITS EAT BEES?

There has been a long controversy in our local newspapers about tomtits eating bees, so I sent them an extract from my Bee-book, which conclusively settled the dispute.

"Nov. 30, 1872, I saw on one of my bee-benches a number of wings, legs, stings, and outside scales of the bodies of bees. I soon said, 'The tomtit (*Parus carolinus*) has been busy here.' I had not noticed or seen it before that year. But about 4 o'clock I saw three tomtits eating my bees. One of them I watched, and saw him fly down on to the alighting-board of one of my hives. He began tapping it with his bill. Shortly a bee came out to see who was there, and was immediately snapped up by the tomtit, which flew with it into an apple-tree near the hive. He then beat the bee against the bough of the tree on which he stood, until it was killed. Then the tomtit with his right foot and beak pulled the bee's wings, legs, sting, and head off, letting the rejected parts fall to the ground, and it then ate the dainty parts of the bee. The tomtit was soon down on the alighting-board again—tap, tap, tap—and another bee came out to see who was there. Then the same process was repeated. I saw him take five bees in this way in seven minutes, when I could stand it no longer. So I frightened the tomtit away, as I was afraid he might have the nightmare by eating such an enormous supper. The tomtits were eating my bees again before ten o'clock next morning. So I brought out my gun, and shot three of them: and on opening their craws I found them nearly filled with bees—one head, antennae, and tongue complete. This bird must have been very hungry, as they generally reject the head. I found no wings, legs, nor

stings in the craws. It grieved me very much to have to kill these useful, beautiful, and interesting birds, but it required the patience of Job to see my pets (the bees) so mercilessly destroyed."

Your experienced correspondent, "G. D.," is quite correct. The tomtit does little harm in summer, there being at that time such an abundance of insect food, which he prefers. It is only when its natural food fails that it attacks the bee-hives.

WILLIAM CARR.

Newton-Heath Apiary, near Manchester, Eng., Dec., 1883.

Many thanks, friend C., for the positive facts you give us in the matter. I am glad to hear you put in that concluding clause, that it is not likely the tomtits would molest the bees, unless driven to it. Charity toward the feathered tribes would be a pretty good failing if we are to err either way.

CAGING QUEEN-CELLS OVER A STRONG COLONY, ETC.

In destroying queen-cells, I often want to save a few for my own use, and yet not enough to bother with a lamp-nursery; therefore what would be the greatest objections to the following plan for rearing a few queens? Make a shallow box, say two or three inches deep, with a wire-screen bottom, and a quilt or lid on top; put the cells in this, and put it over a strong colony, so that the heat would go up in the box, but the screen would keep the bees down. Please describe the looks of cells that you think contain the best queens.

Nashville, Mo.

JOHN UMHOLS.

Your plan is a very old one, friend U., as you will notice by looking through our back volumes. It works tiptop during settled warm weather; but when it comes cool nights, you have to have a very strong colony in a good close chaff hive, or many of your cells will get chilled.—I confess myself unable to tell by the looks of the queen-cell what the queen will be; but this I should want to be sure of, that the cells were built in a colony that had plenty of bees, and plenty of honey and pollen, and also that the cells were built while stores were coming in rapidly every day.

DAKOTA FOR BEE-KEEPING; INFORMATION WANTED.

On page 756, Dec., 1883, you speak of your brother, from Mitchell, Dakota, being on a visit to you. Very likely you questioned him in regard to the climate of Dakota being too severe to keep bees, whether there were any wild flowers and honey-producing plants and shrubs growing on the banks of streams and lakes, etc. Will you kindly make public, in your journal, whatever you may have gleaned from him or any other source, on that subject? Being desirous of going to Dakota to make a home, but not unless we can have the pleasure of keeping bees, an early article on this subject will greatly oblige the writer, and, I think, a great many other people.

Omer, Mich., Dec. 13, 1883.

A. R. C. SCHOLAR.

Friend S., I did question my brother quite a little; and I should infer from what he says, that Dakota might rank well with other States, although perhaps not quite equal to Michigan, York State, and some others. If I am correct, they have no clover in his vicinity around Mitchell. We have fifteen or twenty subscribers in Dakota, whose names we can give you, if you care for them.

HOW OLD MAY A QUEEN BE, AND YET BECOME FERTILIZED?

I see Mr. Alley, on page 25 of his book, says virgin queens may be kept in his nursery, in the center of the brood-chamber "safely for several weeks." Mr. Langstroth says, on page 42 of the third edition of his work on the honey-bee, that "if fecundation has been delayed three weeks, the organs of the queen-bee are in such a condition that it can no longer be effected." I should infer, from what you say on page 66 of A B C book, that you think any time within the "first thirty days of her life" will answer for impregnation. Now, this is a very important point to be decided, if we are to confine virgin queens in the brood nursery for "weeks," for one may thus send out drone-laying queens, if they are retained, thus confined, too long. Has this question been decided by such careful observation as to determine definitely how long a time can elapse before the "wedding flight," without endangering the ability of the queen to lay worker eggs?

It may be that some of your correspondents have written on this subject, or at least have tested this question, and are prepared to give an answer. If so, please let us hear about it.

MARKING THE HIVE WHEN THE QUEEN IS ABOUT A WEEK OLD.

Another point of importance is, that of so marking the hive out of which the virgin queen goes on her marriage tour, that she will not fail to recognize it, and enter it safely on her return. Where the colonies stand close to each other, I have been accustomed to place a green branch on the hive, so that it will hang over in front, or a small flag in the same position. Any thing unusual which will especially attract attention, and strongly distinguish it from all others, is what is needed. I have never lost a queen when I have done this, though often my hives have stood quite near together.

Andover, Mass., Dec., 1883.

L. H. SHELDON.

I know friend Alley makes the statement you mention, friend S., but I think he only intended to convey the idea that they would *live*, if left there several weeks; for I am sure he would expect to have them fertilized when they were 12 or 15 days old. I should be inclined to find more fault with the rest of the expression, where he says they will stay there perfectly contented and happy for several weeks. We experimented in just such cages more than ten years ago, but I never found young queens "happy and contented" for even several days, when they were confined in any sort of a cage, or anywhere else. The question has been a good deal discussed, and I believe 20 days is about the limit. If they are not fertilized at two weeks old, we generally begin to suspect something is wrong; and when they do lay after that, they turn out drone-layers, as you suggest. Very likely your plan of putting a green bush over the hive when the queen is about a week old, has proved quite an aid to her in fixing the locality of her home.

LOSING VIRGIN QUEENS.

My hives are all so near alike I could not tell them apart, if it were not that I have them all numbered, for they are not more than three feet apart. The first 4 I put in, I lost them all, and I thought it was because my hives were too close together. Knowing that young workers often get into wrong hives

I came to the conclusion that this is what became of my queens; so I took a piece of $\frac{1}{2}$ inch pine, and fitted it in the front of the hive outside under the portico, and bored it full of inch holes. I now dropped the queens in one of these holes, and never lost one out of 19 afterward. I did not make the distance any greater between hives, or leave the board in front, after the queen began to lay.

Quincy, Ill., Dec. 25, 1883.

C. H. SMITH.

Friend S., I am inclined to think your idea is a pretty good one. If the young queen crawls out of an auger-hole when she first takes her flight out into the world, she will be very likely to remember the board with the holes in it, and will therefore be attracted to that hive in place of any other one. The objections to the plan would be, that our bee-keepers are so many of them too careless to take the pains to put the board there when the queen was of the right age, and to take it away as soon as she commenced laying. Seems to me about three one-inch holes would be a plenty; and then if robbers should ever be troublesome, the sentinels could easily defend these three holes.

THE "GOOD" CANDY, NO GOOD.

I must pronounce the Good candy that I have read so much about, no good for feeding up stocks for winter, for a few weeks ago I had several stocks that were deficient in stores, and I made the candy as near as I could after directions. I took pure extracted honey, and thickened it with granulated sugar as thick as I could work it with my hands, and put it in trays holding about 6 lbs. each, and put them over the cluster on the frames, and the next day each stock so treated began to carry out and drop in front of their hive the dry grains of sugar—not really a few grains, but in quantities so that I scraped up a pound or so from off the ground. But that was not the worst, for dewy nights and rainy days soon made robbing the order of the day, and they kept totting out the sugar for fully a week, so I shall have to pronounce the Good candy no good for feeding up stocks with.

A. A. FRADENBURG.

Port Washington, O., Dec. 25, 1883.

Friend F., I do not agree. I have been telling you for months you must make the Good candy of powdered sugar, instead of granulated. The finely powdered confectioner's sugar has the grain so small that the honey dissolves, as it were, and you have a smooth paste, almost like butter. We have used this exclusively for almost a year, and I do not believe it will rattle down, as you say.

REPORT OF 1883.

Commenced the season with 29 colonies—21 good, and 8 weak. Spring was cold and wet; summer very wet all through. First swarm May 16. Increased to 48, mostly by natural swarming; received 1197 lbs. honey—507 extracted, and 690 comb—an average of 42 $\frac{1}{2}$ lbs. per colony—about half a crop for this section; honey was very thick, and of fine flavor—all light in color. Bees are Italians and hybrids, the latter gathering the most honey; best colony gathered 135 lbs. comb honey. I use Langstroth hives, 8 frames in brood-chamber, and take all surplus on top.

W. E. YODER.

Lewisburg, Pa., Dec. 24, 1883.

TWO SIDES TO BEE CULTURE.

Certainly there are, as I know from experience. Two years ago I took about 25 lbs. of honey from 10 colonies. I never for an instant had the least notion of reporting my failure in the bee journals. That is the way with thousands of others. On the contrary, if a good crop of honey is gathered, the bee journals hear it, publish it, and make a fuss over it, as if there were nothing but success in the profession. A poor man gets a sample copy of the journal, reads the grand reports, and in the distance a mountain of gold rises to his view. The next spring finds one novice more in the profession, with the bee-fever, an empty pocket, a head full of bees, bee literature, bee-men, and perhaps a dream of honey by the ton, bees by the thousand, and a home in a tropical climate, where the sun always shines, and bees gather honey all the year. Result: The pocket remains empty, perhaps blasted hopes, and as friend Hutchinson says, trade those bees off for a song; or he will make a success, as a great many do, then all is well. Now, Bro. Root, is it right to thus give but one side of the question? H. W. SIMON.

Youngstown, O., Dec. 10, 1883.

I know what you say is true, friend S.; but it is also true in almost every industry. There is a class of people who are changing their business every little while, in the vain hope of finding something better, but who, perhaps, end their lives after all only as Blasted Hoppers. I have always felt sad to see any one go into bee culture who could not afford to lose all he invested, without getting into trouble; that is, I advise, as you well know, commencing with one or two stocks, and not investing very much in the business until one has proved by experience that his locality is right, and that *he* is right. Meanwhile, let him keep on with his regular employment till he can safely make bee culture his sole business, if he wishes to. This may be called amateur bee culture, and it is the very kind I would advise for the great masses. Again, is it the fault of the bee journals if those who fail will not report? I do not know how it is with the other journals, but GLEANINGS always has a Blasted Hopes department open, and has had for years. Would it not be well, friends, for those who criticise so severely, to look over our price list and A B C book, and see if GLEANINGS and its editor are guilty of the charges several times made recently? Note the caution on page 2 of the price list, just after the index. This caution has been kept in plain sight for the past ten years, and all who get one of our price lists can hardly fail to read it.

A FEEDER FOR SPRING FEEDING.

I have used almost every kind of feeder, and all were unsatisfactory, and many stings and much trouble for my labor. So, thinks I to myself one day, I'll make a feeder to suit my wants, and I did, and here is a sample— one of 72 I used last spring. To use it, place the block in the corner of your hive, after pulling back the corner of burlap, permitting the bees to come up to the wire cloth covering the hole in the block, but not far enough to let them into the hive above; fill your tumbler, and invert it over the wire cloth, covering the hole in the block, and place on your cushion. When feeding the second time, simply raise the corner of cushion; lift out

tumbler, fill it, invert, and place back; no bees to sting, none to get in the way, and none to get drowned. Almost any child can do the feeding, and do it quickly and safely. The cushion being left on the hive, the syrup will be carried down on the coldest day in spring or fall. Now, friend R., put this feeder on a hive, and try it, and then make a dozen more and try them, and then you can tell us how you like it. In every way it is the best feeder I ever used.

GEO. F. WILLIAMS.

New Philadelphia, O., Oct. 6, 1883.

I shall have to explain to our readers, that the feeder that is alluded to in the above is nothing particularly new. It is simply a common tin-top jelly-tumbler, such as we sell at 5 cts., or less by the quantity, and with the tin cap punched full of holes. I should think, by the looks of the holes, that friend W. punched them with a square-pointed nail, taking a square piece of tin out each time. I suppose you have all used feeders like this. Now the problem is, to get it over the bees without uncovering the brood-chamber so as to let a draft of air through. I once killed a weak colony by turning up the quilt to set the feeder on. A cold night came, and they froze up solid— bees, queen, brood, and all. Had the mat been down over them so as to confine the animal heat, they would doubtless have stood it all right, for it was in the spring. Well, friend W. fixes it this way: He takes a three-cornered block, large enough to invert the tumbler on, cuts a large hole through, and tacks wire cloth over it. The three-cornered block will just fit in one corner of the upper story, and you can turn back the burlap sheet or carpet, folding down the corner so as to make a close fit, bee-tight, without cutting or mutilating your carpet or mat. The feeder can now be set over the hole, right on the wire cloth, so as to close that down tight. Bees can get their food through the meshes of the wire cloth, and can not get up to sting or bother you when you remove the jelly-tumbler to fill it up again. Of course, the device is all old, with the exception of placing it over a block in one corner; and this latter point is no small matter, when you come to think of it.

HONEY FOR MEDICINE.

Tried remedies for colds and coughs.—*Linseed tea.*—Take 2 tablespoonfuls of flaxseed (*unground*); 1 quart cold water; heat to a boiling-point, then add the juice of 1 large lemon. Sweeten with honey. Dose, 1 wineglassful every hour or two.

No. 2.—Take 1 teaspoonful of hops, 1 pint of water; steep slowly about half an hour; strain while hot; add juice of one large lemon; sweeten with honey.

No. 3.—One large handful of boneset (use leaves, blossoms, and stalks); add 1 quart of boiling water; steep awhile; strain, and add juice of 2 lemons and 12 ounces of honey while hot. Dose, 1 tablespoonful 4 or 5 times a day, before eating.

Battle Creek, Mich.

B. SALISBURY.

EARLY-AMBER SUGAR-CANE SEED; A GOOD REPORT.

Dear Sir:—I wish to say a word in regard to that cane seed which we purchased from you last spring. We planted 1 lb. June 1st, which sprouted and grew one inch above the ground in 6 days. Well, to sum it all up, in the fall we had 51 gallons of splendid syrup; 25 gallons of it we sold for \$20.00, and we have

26 gallons for our own use, worth \$20 00, all from one pound of seed, which cost us 15c. We think that is very good for beginners.

Mr. Gilbert and myself both keep bees, and we study the A B C, which we bought of a brother bee-keeper. We run a woodworking shop, and manufacture bee-keepers' supplies. Wm. H. NASH.

Adrian, Mich., Dec. 28, 1883.

PREVENTING SECOND SWARMING.

Bees in this section seemed to desire to devote their whole time last season to swarming. My 35 colonies increased 75 good strong ones for winter, and gave me about 1000 lbs. of box honey. I experimented with a few to prevent second swarms coming out, by removing the old colony to a new stand after the first swarm had issued, and placing the new swarm on the old stand. This seemed to give the new swarm a large working force, and weakened the old sufficient to prevent a second swarm in most instances. What do you think of the plan?

L. D. WORTH.

Reading Center, N. Y., Dec. 24, 1883.

The plan you give is an old one, friend W. I think you will find substantially the same thing in the A B C book. I believe it is a very good way, only it is pretty hard on the old stock. It prevents them from swarming by crippling them, and removing all their flying bees. As a matter of course, the hive full of brood suffers from lack of nurses, and many young bees are lost that would otherwise be saved. But it may be a very good plan for those who have but little time, and so many bees they do not care for the loss of a few.

Notes and Queries.

HOW LONG WILL COMB HONEY KEEP?

PLEASE tell us through GLEANINGS how long a good article of comb honey will keep, if stored in a warm dry place. I have over 3000 lbs. yet; have 99 colonies tucked away for winter. I keep them in chaff the year round. Hybrids gave me better results than the light Italians. These beautiful bees are fit only for swarming purposes.

J. A. NEWTON, M. D.

Boonville, Ind., Nov. 22, 1883.

[We have kept comb honey as much as two or three years by keeping it where it will not freeze, nor be exposed to dampness of any kind. The worst trouble with it when kept so long is candying. The cells that are unsealed are also liable to slight change, which makes the honey of a little different taste from that recently from the hives. I do not believe it is well to try to keep honey more than from year to year.]

N. A. B. K. A.

Friend Root:—Please add in the list of new members joined at the national meeting at Toronto, the two following names:

Chas. Humphrey, Rockney, Ont.
W. A. Morrison, Frelighsburg, Quebec.

And add to the list the four following names which, in some manner, were forgotten to be reported:

Richard Humphreys, Bothwell, Ont.
Ira Orais Whitley, Ont.
Alex. McKechnie, Angus, Ont.
D. B. Ullery, Northampton, O.

Cincinnati, Dec. 14, 1883.

CHAS. F. MUTH.

My report for 1883 stands: 18 swarms from 5, besides one got away, and 375 lbs. comb honey. I think that is good.

JAS. J. CHURCH.

Waterford, Ont., Can., Nov. 3, 1883.

Mr. Thomas Graham Ashmead, of New York State, is on our streets to-day. Having shipped here about two hundred swarms of bees, he proposes locating them somewhere near New Smvna, and entering quite extensively in the sale of both bees and honey. We cordially welcome all such accessions to our State.—*Florida Herald*, Nov. 6.

My brother-in-law and I started with one stand apiece in the spring, in box hives; we now have 10 by natural swarming—8 strong ones, 2 rather weak. We had one swarm that we took 42 lbs in one-pound sections from. That was the best we could do.

Myron, Ia., Nov. 20, 1883.

JOHN GILBERT.

SOME QUERIES ABOUT ALFALFA.

Should it be sown in the spring, or fall?

[I can not answer about fall sowing.]

Will it do well with other grass seed?

[I think not. My impression is, it should be sown by itself.]

Will it blossom the first year, and, after sown, remain permanently?

[I think it blossoms the first year, and it does remain permanently.]

Will it make good hay for cattle?

[Very good. Cut while young and tender, or while just in bloom.]

Is it a bad weed when once established in the ground?

CHARLES E. PRICE.

Smitttown Branch, L. I.

[I think not.]

CONVENTION NOTICES.

The annual meeting of the South-eastern Michigan Bee-keeping Association will be held at Adrian, Mich., in Plymouth church chapel, Jan. 23, 1884. All are invited.

H. D. CUTTING, *President*.

H. C. MARKHAM, *Secretary*.

The Mahoning-Valley Bee-Keepers' Association will be held in the Town Hall at Newton Falls, on Thursday, Jan. 24, 1884. As that is the meeting to elect officers, every member, and all interested in the production and sale of honey, are requested to be present.

L. CARSON, *President*.

E. W. TURNER, *Secretary*.

CIRCULARS RECEIVED.

E. T. Lewis & Co., Toledo, O., have sent us two price lists—one relative to apiarian supplies in general, and one is devoted to their extractor exclusively. Each 3½x6. The printing is quite fine.

By reading *Kind Words*, you will notice that friend Doolittle has opened the campaign for 1884 with a circular and price list gotten up about the same as last year. We "kind o'" lose sight of Doolittle the bee-keeper when we notice the extent to which he deals in grapes, berries, potatoes, and what not.

From away across the "big pond" comes a price list from Wm. W. Young, of Perth, Scotland. It is 5x8 inches in size, contains 26 pages, well illustrated. Among the list of "foreign" pictures, we notice that quite a large per cent of them are from America. The pamphlet is also a good index of the rapid strides that apiculture is making in foreign lands.

G. B. Lewis, Watertown, Wis., has sent us a 16-page list of what he manufactures in the way of apiarian supplies, etc. The pages are about 3½x5½. On the back is a pretty picture of friend Lewis' factory, standing by quite a stream of water having an abrupt fall of about four feet, as nearly as we can judge by the picture.

Blasted Hopes,

Or Letters from Those Who have Made
Bee Culture a Failure.

BLASTED HOPES IN RHYME.

ARE Blasted Hopes better than no hopes at all?
I can furnish you plenty of that kind this fall.

For the visions my fancy presented last spring
Are gone; not on wings, but for want of a wing.
Like "Jack's bean," they grew in the morn of the
year;

Like frost-bitten plants they lie withered and sear.
No pictures so bright adorn Memory's halls
As those which Hope hung on my ap'ary walls.
My hives were all honey, my bees were all wing,
For fancy had kindly extracted the sting.

But nature, resenting the slur on her art,
The venom replaced, in its natural part—
At the last, and I felt it in heart and in purse,
And still I can feel it—in fact, it grows worse.
E'en Memory blends in the sorrowful cup
But one drop of comfort, the memory of hope.
My seven and twenty swarms dwindled to six;
Only three of that number in very good fix
To resist the stern blasts of old Boreas' breath.

What did it? The arm of the conqueror, Death.
But they fell at their posts. One bright August day,
With a hum of delight they all took their way
To the field, to the mountain, to river, and glen;
But few e'er returned; and the next day again,
They gloomily went and more wearily came,
And every day's programme repeated the same
Sad story. But none could tell whither or why
They were gone. Did they pine for their own na-
tive sky?

*I called Dr. Virgil, their countryman, in
To aid me; but all of his knowledge was vain.
I sought through the GLEANINGS for help in my
grief,

But e'en Dr. Root gave no kind of relief;
And the hunter's sole comfort my solace has been—
Go ahead, "Pick your flint, and then try it again."
And I'll try it again and again; if I fall,
A blasted hope 's better than no hope at all.
So, while in the future no sunshine I see,
The song of Scotch Robbie my own song shall be:
"I whiles clan the elbow o' troublesome thought,
But man is a sojer, and life is a fought.
My mirth and good humor are coin in my pouch,
An' my freedom 's my lairdship nae monarch dare
touch."

MRS. A. C. MOSHER.

San Marcos, Texas, Dec. 21, 1883.

I am very sorry indeed, my friend, to hear
of your loss; still, I am rejoiced to see you
take it with such a cheerful, hopeful spirit.
You surely have abundant reason to feel
discouraged, if anybody has, and your warn-
ing may be a timely one to others. The
first thing that comes before us is to con-
sider whether a remedy may be possible for
such contingences. Only one course occurs
to me at present, and that is, to fasten the

*I suppose they were all poisoned, as the honey-
dew wa- so thick on the cotton that, when the farm-
ers sprinkled Paris green on it (to destroy the
worms), it stuck fast to the leaves; and after the
first good rain, they stopped dying. Nearly all my
neighbors lost theirs in the same way.

bees in their hives with wire cloth until the
rain shall come to wash off the poison. If
the weather is hot, and the hives are full to
overflowing, put on an extra upper story,
and cover both top and bottom with wire
cloth. Then, if need be, set them in a cellar.
We know it can be done, because we have
shipped full colonies of bees, even during
the hottest months of the year; and such a
course would certainly be better than losing
them.

BLASTED HOPES, BUT NOT DISCOURAGED.

Here is our report for 1883: Nov., 1882, we put 115
stands in winter quarters. March 13 and 14 we car-
ried them out of cellar: found two dead. Average
consumption, 6½ lbs. March 18, bees gathered honey
from maple. April 22, from fruit-bloom, April 29
heavy f. o. s. May 11 first white clover, which finds
us with 109 stands; doubled back to 75. Proceeds,
7500 lbs. extracted, and 500 lbs. of comb honey, and in-
crease to 154. We were making ready for —, which
did not come; will live in hopes of doing better next
time.

MOLLIE O. LARGE.

Millersville, Ill., Dec. 5, 1883.

The "Browlery."

This department is to be kept for the benefit of those who are
dissatisfied, and when anything is amiss, I hope you will "talk
right out." As a rule, we will omit names and addresses, to
avoid being too personal.

I WROTE you to know how I could fix the metal-
corner frames so they would keep in place
while I moved them half a dozen miles; but it
seems you stuck up your nose, and threw my letter
into the waste-basket for a reply. My necessity has
driven me to rack my brain to that extent I have
invented a machine for that purpose, that I think
will go ahead of any thing you have in that direc-
tion; nor do I think you will ever be able to come
down to it, or compete with it, as it is so simple you
will be hardly able to come in sympathy with it. It
is cheap—handsome, handy, takes up no room, kills
no bees, is stationary, holds the frames to their
place, if there is but one, and that in the middle of
the hive. It is beyond description, with a head no
larger than mine; and better than all of this, it is
eternal, everlasting, with but one end to it. What
do you think about you and I getting it patented?

Syracuse, N. Y., Dec. 4, 1883.

JOHN DO.

Friend D., I did not stick up my nose,
nor throw your communication into the
waste-basket at all. I do not ever stick up
my nose at anybody or any thing; and in re-
gard to throwing letters into the waste-bas-
ket, I do not think I very often do that, and
I certainly do not treat inquiries from bee-
friends in that manner. On page 25 of our
price list you will see spacing-boards for
this very purpose; and I think I remember
your inquiry, and that I penciled on the
margin of the letter, that the clerks should
refer you to that. When I get letters from
somebody who wants to advertise a lottery
scheme, or something of that ilk, I believe I
do sometimes throw them into the waste-
basket. I was going to add the same in re-
gard to those who wanted me to go into the
patent-right business, but I think I won't,
on account of your concluding sentence.

Now, I do not know how we can decide in regard to your "great invention with but one end to it," till you tell us a little more about it. By the way, friend D., I thought you really belonged in the Growlery; but after I got through I concluded it was a bit of pleasantry; but as we have not had any thing for the Growlery for some time, I guess I will let it go there.

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE
OF READING MATTER.

MEDINA, JAN. 1, 1884.

I have meat to eat that ye know not of.—JOHN 4: 32.

HAVE any of you got any white Dutch clover seed, or white-clover seed without the "Dutch"? Please mail a sample, and say what you will take for it, if you have.

FRIEND ALLEY'S new book on queen-rearing is now furnished for an even dollar. We have them in stock, ready to mail, on a moment's notice. We can furnish them by freight or express with other goods for 90 cts.

We are just filling an order for 5000 lbs. of honey, to go to England. It is true, I get only 10 cts. per lb. for it, but I am thankful for even that, because it promises to open up a trade that may enable me to help our bee-keepers to dispose of their honey. The honey is to be shipped in 50-lb. tin cans, two in a case. And, by the way, I am inclined to think I would a little rather have honey stored in tin cans, when it is first taken from the hives, than to have that which had been put in barrels of any kind. How is it, friends?

WHOLESOME READING FOR THE FAMILY.

SEVERAL of late have asked what paper I would advise them to take. After giving the matter some thought, I have settled down on the *Sunday-School Times*. There are papers more interesting, perhaps, and there may be papers that should come before this, owing to various circumstances; but in all my reading, I know of none that seem to contain the real solid, substantial, profitable food for thought as does the *Times*. Turn to its columns where you may, and you will always find something elevating and ennobling. Its moral tone is of the highest order, and not a line ever finds a place on its pages that does not carry a moral lesson with it. It requires some study and thought, much of it, I know; but when one lays it down, it is always with the feeling of having been made a little better by its wise counsels. We can furnish it to the readers of GLEANINGS for \$1.25 per year. It comes every week. The regular price is \$2 00.

HOW TO CONVERT A POOR ARTICLE OF EXTRACTED HONEY INTO AN EXTRA FINE ARTICLE.

The idea was given by friend C. C. Miller, at the Toronto Convention, and, so far as I remember, it

has never appeared in print. It is this: Get your poor honey candied, as solid as you can. Then drain off the liquid portion, all you can get drained off, and sell this liquid portion as a poor grade of honey. Now take the remaining solid honey and melt it carefully, without scorching, and you will have honey thick, transparent, ripe, and of beautiful flavor. The success of the operation depends on getting the liquid portion entirely out of the candied honey. The process is not unlike that used for refining loaf sugar. The coloring matter and impurities run off from the crystals, leaving them white, dry, and pure, like crystallized rock candy. Of course, the honey does not crystallize as does cane sugar, but yet the candying process is something akin to it. Maybe sugar refiners could suggest to us some mode of washing or cleansing these solid crystals of candied honey. I think the matter needs investigation.

COMB FOUNDATION FOR 1884.

As a matter of course, much discussion is going on, and much comparing of samples. Like all other manufacturers, I presume, we think ours is at least as good as any, samples of which will be mailed free to just as many as care to have them. Samples we send out run pretty light—say 8 to 10 feet to the pound; but with the rather thick soft walls, we think they will answer for either brood or section boxes, although we as a general thing make it a little heavier for brood combs. Our samples may not be as nice looking, or as bright and glossy, as some others that are sent out; but I tell you, friends, if you will submit the whole matter to the bees, and let them decide which they prefer, we have no fear but that you will agree with us, that ours is certainly equal to any in the world. Our mills are now stacked up, ready for shipment; and to avoid the delays that may be disastrous to you in a few months more, I would earnestly recommend ordering pretty soon. Our mills all make either thick or thin fdn., as you choose; and if there is any improvement that can be made in them for real work, we should be glad to know it.

THE GIVEN FOUNDATION - PRESS.

D. S. GIVEN & Co. have sent us a very pretty circular on the Given foundation-press; and it would seem, from the abundant testimonials, that they are making a decided success of it. One great obstacle in the way of its use to us would be, that the wired frames of fdn. are not sufficiently strong to admit of shipment—at least, I have heard no reports of their having been able to manage this point. If I am mistaken, I shall be glad to be corrected. Another thing, I do not quite understand why the Given fdn. should be superior to that made on rolls, for it is an easy matter to make rolls that will make fdn. with as heavy soft walls as that made by the press—at least, that is my understanding of it. However, one thing is very certain—that it is pretty much out of the question to think of making fdn. with rolls right in the wired frames, and in this point the Given press is far ahead of any rolls. When we last discussed the matter, I believe it was also admitted that we could not make the sheet of fdn. in a wired frame so as to completely fill the frame, as we have them when made by rolls. Very likely I am ignorant on all these matters; and if so, I want to be posted; therefore I would ask friend Given to send me some frames filled with fdn. made by his machine. If they ship safely, and the wax comes clear up to the wood, I shall be quite ready to report in our next issue aff-

ter receiving them, and shall also want a press besides. I know a good many find fault with the cautious way in which I advise new improvements; but I presume the majority of our readers are well aware that I am trying to do it for their sakes, and also try not to let any selfish motives bias my decision. After having done this, if I receive unkind or abusive words, I will try to bear them with meekness. It is a very important question now before our bee-keepers, as to whether they shall get a pair of rolls or a press.

We open the new year with 4275 subscribers, which is certainly quite encouraging for a start. Many thanks to you all.

I EXPECT to be at the Ohio Bee-keepers' Convention, to be held in Columbus, Jan. 14, 15, 16, nothing preventing. For particulars, see page 782, Dec. JUVENILE.

We notice that one of our advertisers offers comb fdn. at from 3 $\frac{1}{2}$ to 3 $\frac{3}{4}$ cts. per lb., which is hardly equal to the value of the wax. We presume he will be sold out speedily.

BEAR in mind that fdn. is now 3 cts. higher than in any catalogue you may have. The price of wax is the same as in our last. We pay 32 cts. cash, or 34 trade; but we have none for sale less than 38. The demand seems to be so brisk that prices will probably go higher very soon.

ADULTERATION OF SUGAR, AND ADULTERATION OF HONEY.

PEOPLE who are ignorant of the present advanced state of bee culture accuse bee-keepers of manufacturing their honey, or adulterating it with glucose; or putting it in artificial combs, and sealing it up with hot irons, and the like. We smile at their ignorance, and lament their uncharitableness. Now, then, to turn it about, are we not in danger of accusing sugar refiners of dishonesty and fraud, in something the same way? Do we as a class know much more about refining sugar, than the masses know of bee-keeping? Is it not possible, that the talk about granulated sugar being adulterated is nearly on a par with that stale piece of folly about comb honey being manufactured? There are some recent articles in the *Scientific American* bearing on this subject.

THE BEE-KEEPER'S HAMMER.

A GOOD many times one can do quite a good deal with a little ready cash on hand. A few days ago a manufacturer of hammers told me he had a large lot of light hammers of a special pattern that he would sell very low to get rid of them. On examining a sample I found it was just about what bee-keepers want to nail up hives, honey-boxes, etc. He wanted about 25 cts. apiece for the whole lot of 50 dozen. I made him an offer of a price that would enable me to sell them to you for an even 25 cts., and he finally, with many protests, took up with my offer, to get them off his hands. They are tempered cast steel, beautifully finished, with a solid hickory varnished handle. The claw is nicely made, sharp, and so finely tempered that a nail without a head can be pulled without trouble. These hammers are just what every bee-man will want as soon as he sees one, so it seems to me. We can mail you one for 12 cts. more than the price (25 cts.), so you will see that the hammer weighs just about 11 ounces. In lots of 10, we can furnish them for \$2.40, or 100 for \$23.00.

SEND for the STANLEY DOLLAR SMOKER. See advertisement in another column.

DUNHAM COMB FOUNDATION.

We have bought a large stock of choice yellow beeswax, and can furnish Dunham Comb Fdn. for brood comb, cut to any size, for 45c. per lb. Extra thin and bright yellow fdn. for sections, at 55c. per lb. We will guarantee our fdn. to be made of pure beeswax, and not to sag. Will pay 30c. per lb. for yellow wax, or will work it up for 10c. per lb. To induce our customers to order fdn. early in season, we will allow 8% discount on all orders received before the first of March. Address orders at once to

Our honey crop being very large, we offer **THIRTY THOUSAND POUNDS OF EXTRACTED HONEY FOR SALE AT REASONABLE PRICES.**

We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send 15 cents for our 24-page pamphlet on harvesting, handling, and marketing extracted honey.

DADANT'S FOUNDATION.

From James Heddon, July 27, 1883. "Your fdn. is certainly the nicest and best handled of any I have seen on the market. It is the only fdn. true to sample, I have ever received."

From Jas. Heddon, Aug. 10, 1883. "I will contract for 2000 lbs. of fdn. for next season on the terms of your letter."

From A. A. Newman, Aug. 24, 1883. "Book my order for 5000 lbs. for spring delivery."

From C. F. Muth, Sept. 6, 1883. "All of your shipments of fdn. during the season were sold on the day of their arrival."

Dealers, send in your orders for next spring, while wax is cheaper, and thus save trouble and money.

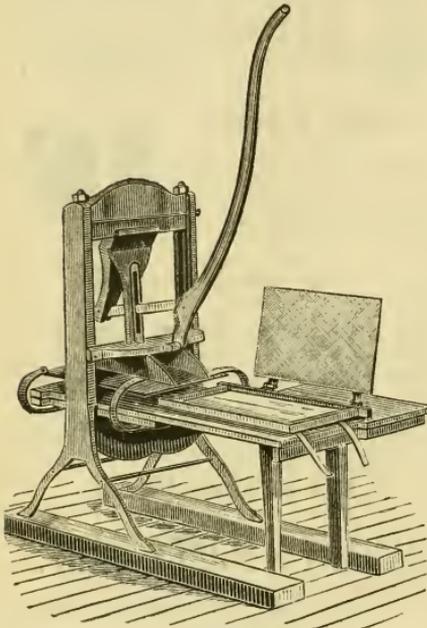

We pay 28c cash for prime wax.

CHAS. DADANT & SON,

WANTED!

You to send for our very low prices on U. S. Standard Honey Extractors. Would solicit the patronage of those wishing large lots of 4-in. and other goods. Have a stock of 5x5 sections to mail, and can furnish Chart and Simplicity Hives and One-Piece Sections. Will exchange goods for choice Extracted Honey.
G. W. STANLEY & BRO.,
12-5d Wyoming, N. Y.

HEADQUARTERS

IN THE

SOUTH

FOR THE MANUFACTURE AND SALE OF

BEE-KEEPERS' SUPPLIES.

*The Only Steam Factory Erected in the South,
Exclusively for the Manufacture of Hives,
Frames, Sections, &c., &c.*

Van Deusen-Nellis, and Root SIMPLICITY Hives, and the $4\frac{1}{4} \times 4\frac{1}{4}$ all-in-one-piece Sections a speciality.

Comb Foundation made on the Root and Dunham mill, of pure wax, and worked on shares.

Extractors, Smokers, Honey-Knives, Bee-Veils in the apiary.

Italian Queens and Bees. No other races in the neighborhood. The superiority of the queens reared in my apiary is so well established, that no commendation is required. I send out no queen that I would not have for myself; and any one receiving a defective or worthless queen from me will have it replaced, etc.

Untested Queens in April, \$1.25; in May, \$1.15; in June and after, \$1.00. Rates per dozen given on application.

TESTED QUEENS from March 1st to July 1st, \$2.50; and after, \$2.00.

SELECTED TESTED QUEENS, reared previous season, to breed from, \$3.00. All my queens are reared from selected imported mothers of my own importation, and from selected daughters.

EARLY 4-FRAME NUCLEUS, with tested queen, \$5.00. I have made a speciality of the 4-frame nucleus for the last six years, and have sent them out to all parts of the United States and Canada, and so far without loss or complaints.

EVERY NUCLEUS I send out contains at least 3 lbs. of bees when received and sent out in the full-size Langstroth frame. They are cheaper and more advantageous than bees by the pound. Any one wishing a list of those to whom I sent nuclei the last season can have it on application, so they can inquire what they were, etc.

FULL COLONIES in any quantity. Perfect satisfaction guaranteed in every instance. For more particulars, and prices, send for my descriptive illustrated catalogue.

Bayou Goula, Iberville Parish, La.

BOOKS for BEE-KEEPERS and OTHERS.

Any of these books on which postage is not given, will be forwarded by mail, *postpaid*, on receipt of price.

In buying books, as every thing else, we are liable to disappointment, if we make a purchase without seeing the article. Admitting that the bookseller could read all the books he offers, as he has them for sale, it were hardly to be expected he would be the one to mention all the faults, as well as good things about a book. I very much desire that those who favour me with their patronage, shall not be disappointed, and therefore, I am going to try to prevent it by mentioning all the faults so far as I can, that the purchaser may know what he is getting. In the following list, books that I approve, I have marked with a *; those I especially approve, **; those that are not up to times, †; books that contain but little matter for the price, large type and much space between the lines, ‡; foreign, §.

BOOKS ESPECIALLY FOR BEE-KEEPERS.

As many of the bee-books are sent out other goods by freight or express, incurring no postage, we give prices separately. You will notice, that you can judge of the size of the books very well, by the amount required for postage on each.

Postage. Price without postage.

My Vegetable and Flower Seed Catalogue for 1884, the result of thirty years' experience as a Seed Grower, will be sent free to all who apply. All my Seed is warranted to be fresh and true to name, so for that should it prove otherwise, I agree to refill orders gratis. My collection of vegetable Seed, one of the most extensive to be found in any American Catalogue, is a large part of it of my own growing. As the original introducer of Ellipse Beet, Burbank Potatoes, Marbled Early Corn, the Hubbard Squash, and scores of other new Vegetables, I invite the patronage of the public. In the gardens and on the farms of those who plant my seed will be found my best advertisement.
JAMES J. H. GREGORY, Seed Grower, Marblehead, Mass.

STANLEY DOLLAR SMOKER

A large 3-inch barrel Smoker, made of best material, and warranted to give satisfaction for the very low price of \$1.00 each or \$9.00 per dozen. It has the most perfect draft of any smoker in use, and has no slides or screens to get out of order. **PERFECTION, SIMPLICITY, DURABILITY, and ECONOMY.** Ask your supply dealer for it, or send \$1.00 to the manufacturers and get "The Stanley" at once; 25 cents extra by mail. Liberal discount to the trade.

We shall continue the sale of the U. S. Standard Honey-Extractor at 10% less than factory prices. They are made duplex reel to turn the combs without lifting from the can for any size of frame up to 10x20 inches, and larger sizes can be made to order on short notice.

In addition to the above, we shall continue the manufacture of our celebrated Vandervoort Foundation at very reasonable prices.

All correspondence answered by return mail. Write, stating just what you want, and we will give you a good trade. Address all communications to

1d **G. W. STANLEY & BRO., WYOMING, N. Y.**

Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 2c cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cts extra for postage. Boards saying "Bees and Queens for Sale," same price.

CITY MARKETS.

CLEVELAND.—Honey has been a little slow for a week past, but prices are unchanged; best 1-lb. sections sell at 17@19c; best 2-lb. sections, 16@17c. Second quality slow at 2 cts. less. Extracted, as usual, is not wanted. *Beeswax* is in excellent demand at 30 cts., but no supply. A. C. KENDEL,
Jan. 11, 1884. 115 Ontario St., Cleveland, O.

CHICAGO.—Honey.—The demand for honey is very light, and prices are uncertain; but with a weak market, concessions are made. Quote 1-lb. sections 15@20c.; 2-lb. sections, 14@16c. Extracted, 7@10c. *Beeswax*, 30@35c, according to quality.

R. A. BURNETT,
Jan. 12, 1884. 161 South Water St., Chicago, Ill.

ST. LOUIS.—Honey.—Comb honey is dull, retailing at 13@17 cents; 18 cts. for extra fancy one-pound sections; 2-lb. 14@16 cts. There was not much demand during the last week. Extracted honey sells in cans say 2 gallon, at 10 cts., retail; in barrels at 7@8 cts.; half barrels, 7@8 cts. There is not much demand. *Beeswax*.—Our market for wax is strong, dealers paying 32@33c for the article as it arrives. There is not much coming in, and the stock in the city is small. We think that it will go to last year's top prices. W. T. ANDERSON & Co.,
Dec. 20, 1883. 104 N. Third St., St. Louis, Mo.

DETROIT.—Honey.—The market is steady, though not very active. Good samples are bringing 17@20c. *Beeswax*.—Scarce at 30c. A. B. WELLS,
Detroit, Mich., Jan. 14, 1884.

CINCINNATI.—Honey.—There is no change to note in the honey market. The demand is generally improving for extracted honey, but supplies being large and arrivals plentiful, there is no advance in prices. I expect a large demand in the next few weeks. The market for comb honey is very tame, without change in prices. The best in small sections brings 16@20c from store. Extracted honey 7@10c. *Beeswax* brings 30@34c on arrival. C. F. MUTH,
Jan. 12, 1884. 976 Central Ave., Cincinnati, O.

BOSTON.—Honey moves slow, all kinds, 1-lb. sections, 17@20c.; 2-lb. sections, 16@18c. Extracted, 8@10c. *Wax*, none. BLAKE & RIPLEY,
Jan. 11, 1884. 57 Chatham St., Boston, Mass.

KANSAS CITY.—Honey.—The extremely cold weather of the past week has put a check on the movements of honey, both in and out, and some light concessions made in prices. Extra choice, 1 and 2 lb. sections, 17@18c. Dark and irregular, 15@16c. Sales for the week, about 20 000 lbs.; receipts, 3000 lbs. Extracted, slow. Sales about 2500 lbs. at 8@9½c. Receipts light.

JEROME TWICHELL,
Kansas City, Mo., Jan. 7, 1884. 514 Walnut St.

Inclosed with the above report, friend T. sends us a printed slip, containing such good advice to honey-shippers that we give it entire here:

TO HONEY-SHIPPERS.

I receive a great many letters asking what I am paying for honey, how to ship, whether freight or express, what size cases, etc., and to answer all as clearly as possible, I submit the following:

First, I prefer not to buy honey outright at all, as I am a commission merchant and not a speculator; but when I do buy, of course I expect to pay less than what the net proceeds would be if sold on commission. I charge 5 per cent commission for selling, and that covers the entire expense except freight. When goods are held for a limited price by instruc-

tion of shipper, then a reasonable storage fee is charged. When no limit is placed on the goods they are sold just as quickly as possible after arrival, at the very best price that can be obtained, and returns made at once. In my market reports to the different bee journals, I try not to mislead shippers by exaggerated prices, but, on the contrary, I am careful to fall rather below than above the prices obtained, thereby insuring better satisfaction to the shipper when he receives his account of sales, showing infrequently better prices than he had anticipated.

MANNER OF PACKING.

All honey-producers will, of course, know that in packing the sections in the case, they must be so arranged that the combs will not touch each other nor touch the sides of the case, and that they must be wedged in so that they are absolutely immovable by the ordinary jar of handling the cases. I would recommend always the use of the paper pan in the bottom of the case (heavy manilla paper folded at the corners in the form of a pan). It catches all drippings, and preserves the cleanliness of the case. The cases should be of clean, new lumber, well fastened together, with a panel of glass in one or both sides, and as light as possible. The glass serves the double purpose of insuring careful handling, and also affording the retail merchant a neat and convenient package from which to sell the honey.

SIZE AND SHAPE OF CASES.

Next, as to size and shape of cases. These should be as nearly uniform among all packers as possible, and I would suggest as follows, viz.: 1-lb. sections put 4 lengthwise and 6 across in a one-story case, or double in a two-story, making say about 20 lbs. in one and 40 in the other. 2-lb. sections, put 3 lengthwise and 4 across, making either one or two stories, and about 20 and 40 lbs. in a case. Larger sections than 2 lbs. I do not recommend at all, so having nothing to say about sizes of cases for them. Secure the lids with small nails, and not too many. There should always be hand-holes on the ends of the cases, to insure the careful handling of them. Mark the weights on end of case, never on top, as they become blurred. The net weights are not essential, but the weights of the cases, or tare, must always be plainly given.

Extracted honey I prefer in 5-gallon square tin cans with screw tops, packed two in a case. If, however, these are found more expensive than barrels or kegs, the latter will do. Pails are not desirable for this market; though broken comb may be put in 10 to 25 lb. pails, and in that shape will usually bring 6 or 7c. less than sound combs in the boxes.

In marking for shipping, use a very small stencil or card. If the above suggestions are adopted, comb honey may be shipped any reasonable distance by freight with perfect safety, and will bring better prices and quicker returns than the usual slip-shod cases in all sizes and shapes. JEROME TWICHELL.

I have 3000 lbs. extracted honey, half white clover, the other half basswood. It is put up in 50-lb. tin cans. Will take 9c per lb., with the can, crate it, and deliver on board the cars at Palestine Station, Petersburg, Mahoning Co., O. WM. BARTH.

I have 2000 lbs. of fine white-clover honey, in sections, that will weigh 1½ to 2 lbs. each, that I will sell. J. A. NEWTON.
Boonville, Warwick Co., Ind.

VIRGIL'S TREATISE ON BEES.

Concluded.

UPON the capture of Proteus, as told last month, a little angry parley ensues between him and Aristæus; and then Proteus breaks the seal of mystery, and discloses to Aristæus that he stands charged with the death of Eurydice, and her husband Orpheus; and that the wood-nymphs, that were companions of Eurydice, had destroyed his bees as a punishment. It appears that Aristæus once entertained in his heart a wicked design toward Eurydice. She was aware of it, and kept out of his sight. In order to avoid him one day, it was necessary to creep along the brink of the river. A deadly serpent, that she might easily have seen and avoided, lay in her way; but as her eyes and thoughts were wholly occupied with a different danger, in another direction, she ran directly upon the serpent, and was bitten, and died. Aristæus appears not to have known that there was any connection between her death and his wicked intent; and so he dismissed the whole subject from his thoughts. How forcibly this brings out the evil character of *meditated sin!* We don't know how much evil it may be doing, to others as well as to ourselves. If we could grant the truth of the story, it would be quite a subtle question to determine just how far Aristæus should be held responsible for the frightful and far-reaching results of his uncommitted act.

Well, this thread of connection enabled Virgil to tell a considerable part of the story as an embellishment to his bee-poem. It is one of the most pathetic and beautiful of all the ancient fables; and, as we

here have Virgil at his best, I will be brief in my comments, and insert the most of it. You will understand that Orpheus was a most wonderful musician. He conceived the bold design of influencing by his music the beings that had charge of the souls of the dead, and making them release Eurydice, and return her to this world.

THE GRIEF OF ORPHEUS.

Orpheus, making loneliness more lone,
His frantic love did to his harp intone;
Thou, sweetest wife, his theme wast evermore,
While wandering on the solitary shore:
Of thee he sings when peeps the morning day,
Of thee he sings when evening fades away:
He entered e'en the mountain jaws that bound
The lofty gates of Pluto's realm profound,
And in that forest, with its misty gloom
Dark with the dread reminders of the tomb,
Drew near the realms departed spirits own,
And faced the king of terrors on his throne:
Hearts never known in pity to relent
At human prayers, his tearful music bent.

THE ASTONISHMENT IN HADES.

Then from the lowest seats, deep down within
The land of death and darkness, spirits thin,
Forms void of life and light, a ghostly throng,
Rushed forth together, startled at the song.
So thick gregarious birds in thousands fly
To join in chosen groves when night is nigh,
Or when, from mountains driven, in troops they form
To seek a refuge from the winter's storm:
Mothers and men, heroes in glory slain,
In immaterial forms compose the train.
Boys, girls, not yet of age to wed,

Youth in its vigor numbered with the dead,
And laid on funeral piles that flame the skies
Too soon, before their weeping parents' eyes.

THE BOUNDARIES OF HADES DESCRIBED.

Around them all infernal rivers wind,
Dark with deep mud, with reeds unlovely lined.
Slow creeps the reeking swamp, nor brisk, nor still,
Waves murmur not of love, but death and ill:
Yea, nine-fold Styx surrounds, and flows between
Their clime and ours where sunlight, beams serene.

MUSIC CONQUERS THE INFERNAL POWERS.

Infernal dynasties, the powers below,
Dazzled by the music, let their natures go;
The Furies, even, in the lowest hell,
Twined with blue snakes for hair, confessed the spell;
And Cerberus, the dog of hell's police,
Ope'd his three mouths to bark, but held his peace.
Torment and grief subsided at the song,
While Orpheus as a conqueror passed along;
And Ixion's torture-wheel, unknown to pause,
Stopped, as he named, and pined, and won his cause.

RETURNING WITH EURYDICE.

Turning his glad foot homeward now at last,
His toils were o'er, and dangers all were past;
Eurydice, the darling of his care,
Surrendered, just approached the upper air,
Behind him keeping; for the infernal queen
Bade for the journey that she be not seen.

A MOMENT'S FORGETFULNESS.

Ah! sudden thoughtlessness did seize just there
The incautious lover of the rescued fair—
Most pardonable, truly, did they know
How to forgive in the drear land below.
His own Eurydice he now had brought
Beneath the light, her eyes the beam had caught,
When, conquered of the love that swept his mind,
Forgetting then, alas! he looked behind.
Ah, wretched Orpheus! in that very spot
All of his labor instant came to naught;
And there the terms of death's stern tyrant broke,
And thrice did Hades crash with thunder stroke.

EURYDICE'S FAREWELL.

O Orpheus! why, in piteous tones she cried,
Hast lost thyself, and thine unhappy bride?
What is this power? I feel its furious breath;
Harsh fates recall me to a second death;
Sleep shuts my swimming eyes with iron spell;
It is the sleep of death; and now farewell.
In thickest night enfolded round and round
I'm borne away, a helpless captive bound;
Alas! no more your happy bride I'll be,
But to the last I stretch my hands to thee.

DESPAIR.

She said; and from his eyes like smoke in air
She fled dispersed, no vision more was there.
Grasping at shadows wildly and in vain,
Frantic he stood alone upon the plain,
Thinking so many things he wished to say,
But she who might have heard had passed away.
Returning quickly to the infernal shore,
The ferryman refused to take him o'er.
What should he do, his wife twice snatched away?
Where bear himself? or what device essay?
Or with what weeping should he move the grave?
Or with what song persuade the gods to save?
All vain! cold in the Stygian boat she lay.
And now for ever more she floats away.

ORPHEUS IN THE WILDERNESS.

For seven long months in order, they declare,

He wept beneath a rock that rose in air,
Where lonely Strymon's river rolls its waves,
And sang these things within its chilly caves:
He calmed the tigers' bloody thirst with song,
And moved amid the mighty oaks and strong.
Thus her lost young the mournful nightingale
Beneath the poplar's shadow doth bewail.
A plowman found them, as unfledged they lay,
And with hard heart he snatched them all away;
And seated on a bough she weeps her song,
Repeats it o'er and o'er the whole night long;
With sad laments she fills the land afar,
And sadder yet the songs of Orpheus are.

ORPHEUS AMONG THE HUSBAND-HUNTERS.

No sweetheart, in the guise of pitying friend,
Could Orpheus' mind toward further hymen bend.
Far off alone his heart was fain to go
O'er hyperborean ice and Russian snow,
His lost Eurydice bewailing still
And Pluto's gifts, that proved so vain and ill.
At length the Thracian women on him turned,
Whose brazen favors he had coolly spurned,
And in the frenzy of their midnight feasts,
Held to the god of wine, like savage beasts,
They strewed the youth so late their hope and pride,
Torn limb from limb through meadows far and wide:
Then also when the river Hebrus rolled
His head torn from his marble neck so cold,
Down the mid whirlpool bearing it away,
The wonted voice refused to silent stay.
"Eurydice!" the cold tongue called once more,
His soul departing for the silent shore,
"O poor Eurydice!" and echoes came
From all the banks bearing the precious name.

I can overlook the heathenism of all this in consideration of its tender and majestic power. Too sentimental? Well, perhaps it is. At any rate, Orpheus completely beats the undutiful wife who would say "scissors."

And Aristæus, at the conclusion of such a counterblast, naturally trembled, and felt pretty blue; but his mother quickly cheered him up. The cause of the disease among his bees was now known (and it wasn't pollen either), and she knew that the nymphs would quickly forgive, if they were properly worshipped with sacrifices. Very briskly she recled off the various steps to be taken to make all straight. Four bulls and four heifers must be sacrificed to the nymphs, and the bodies left in a grove. Next, after waiting nine mornings, he was to offer poppies to Orpheus, and a young heifer to Eurydice, and a black sheep (emblem of himself, I reckon), and then he must go again to the grove where the first sacrifices lay. He did so, and behold bees were swarming out of every carcass. On a prominent tree they clustered, making it look as if it were hung with great clusters of grapes—evidently not one swarm only, as a word in my last article would indicate, but eight swarms. We may safely assume that he hived 'em "quick sticks," and "had no trouble any more, any more."

Then with compliments to Augustus the emperor, and a little chattering about himself, Virgil brings his remarkable poem to a close.

E. E. HASTY.
Richards, Lucas Co., O., Jan. 7, 1884.

Friend Hasty, if the man who doesn't love music is "fit for treason, strategy, and crimes," it must be equally so, we think, of him who can not follow with pleasure this insight you give us into Virgil's mind.

KENTUCKY.**CORN SILK FOR WINTERING.**

WE are having one of the severest winters ever known in Kentucky. The fall, and until the middle of December, was delightful. December 16th it commenced snowing, and has either snowed, rained, or been very cold, every day since. On the morning of January 5th the thermometer registered 20° below zero—a cold never known here in the memory of any.

Bees were in a fine condition in the fall, both in stores and numbers, and where properly prepared will likely go through all right; but many bee-keepers, through neglect, will lose heavily. My 70 colonies, so far as I can discover, are doing well, and I have no fears of losing any, except from long confinement. I winter on the summer stands, and pack them a little differently from most persons. I spread the combs so that eight or nine will fill same space occupied in summer by ten. Then placing sticks crosswise of the frames, to allow a passway for the bees, I spread a cloth above them, and pack on the top of this two or three inches of corn silks. For packing, these are superior to any thing I have yet seen or heard of. They are clean, and excellent non-conductors, and will more readily absorb the moisture than either chaff or sawdust, and yet remain perfectly dry. They are easily collected by a boy when men are husking in the fields; and when taken off in the spring can be stored away for another winter. Knowing the value of them by experience, I hope that many of our brother beekeepers will give them a fair trial. Please give us your opinion of them in GLEANINGS.

Walton, Ky., Jan. 12, 1884.

L. JOHNSON.

SOMETHING MORE ABOUT THE JONES PERFORATED ZINC.

HOW THEY LIKE THEM IN CANADA; AND SOME KIND WORDS BESIDES.

AS you desire information from Canadian beekeepers who have used Jones's zinc honey-boards, we thought perhaps our experience with them would be of some interest to the readers of GLEANINGS.

We tried the first over a colony of strong Italians, which were in splendid condition to commence work in the upper story. We put on our honey-board, and after about a week we removed it again, feeling sure that we were losing honey, for not a bee would commence work above that honey-board, although we tried to tempt them up by putting ten frames filled with fdn. in the upper story.

We tried it next time over a colony that was just overflowing with honey, so that they were compelled to commence in the upper story. At first we thought all was going to be right this time; but when we examined the frames we found them full of brood, so we concluded that the queen got through the zinc. We also tried the guards, to prevent swarms on Sundays, but we proved to our entire satisfaction that the queens got through them also.

While we feel that our experience with Jones's honey-boards has not been a complete success, we think it very possible that D. A. Jones will so improve them that they will yet work in an entirely satisfactory manner.

We have used your little bread-pan feeders, but

found that the bees would get drowned, more or less, in spite of the cloth. We think that we improved them by painting them outside and inside, and sprinkling them while wet with fine sand. Try it.

You can not imagine how much we enjoyed all you said in Oct. No. GLEANINGS about Canada and us Canadians. It was indeed a great pleasure to shake hands with you (we had the honor); but the way in which you spoke of Old England and our Queen made us feel that there was not so much difference between us after all. Such language will do more toward annexation than all the American army on our frontier.

GRAINGER & DUKE.

Deer Park, Toronto, Ont., Jan. 14, 1884.

Friends G. & D., we are very much obliged indeed for your report, as well as your kind concluding words. I am inclined to think, from your statement, that the bees will work through the zinc honey-board, if they are started all right. I have a great many times seen Italians that would not readily at first take to the frames filled with fdn. in the upper story, although when I lifted one of the brood combs from below, and put a sheet of fdn. in its place, they all went up in a rush. Now, was not this the case with your first experiment, and would it not have been pretty much the same, if you had not used the zinc honey-board at all? Your second experiment proved nothing against the honey-board, more than that it let the queen through; for if she went up, the bees certainly went up first, so the honey-board was no hindrance. Perhaps some further trials might work all right, especially if the hive contained a queen with a little broader shoulders. One great use of the zinc honey-boards, as I understand it, is to keep the bees from building combs between the upper and lower stories; for this, with a great many colonies, has proved a very great nuisance.

LETTER FROM ONE OF THE A B C SCHOLARS.

SOMETHING, ALSO, IN TRANSFERRING BY THE A B C BOOK.

WELL, here I come, a subject for the wastebasket. Hardly got my A B C's learned yet, but have done as well as I could, and oversee a farm besides. I thought I had done my share of hard work in years past, and took up bee-keeping for both pleasure and profit. One year ago last fall I bought three swarms in what was but little better than store-boxes. One, I think, was a boot-box. Of course, I had to get them home, and just how to do it successfully was the question. Well, I waited till cold weather, and tied the bottom-boards on with ropes, stopped all open places with rags, and their name was legion; set them on some hay in the wagon, packed the same around, and drove slowly home. When I began I knew about as much about bees as a guinea-pig does about the north pole (or some of our late explorers either; can't see much difference). All I knew to a certainty was, that they had one sharp end, and gathered honey.

I got them home all right, made a little shed for them fronting the south, and just north of a peach-grove, just far enough from it so the sun would strike the hives over the trees, packed all around,

except the south, with hay, just as well as I could. In the coldest weather I banked up the south side also. They came through all right.

If I am correct, about that time I got my A B C book, and the mysteries of the honey-bee began to vanish. Well, the time came for transferring. I was very anxious to get it done, yet dreaded it. I got my traps, carried a hive a few rods to a bare spot of ground on the sunny side of a building, and off with one side-board (having previously given them a little smoke), and began cutting out the combs. I had the hive turned back against the building, and all was going along finely when the fuel in the smoker became exhausted; in fact, the thing went out. The bees were in large clusters in and around the hive, and I expected every moment they would break loose in a mass and go for me. My wife was as badly scared as I was, and pretty nearly cried. I replenished the smoker as fast as possible; but as good luck (we thought) would have it, not a bee peeped. Our fears were needless. The vigorous way my wife had used the smoker had burned it out too soon, but it had done its work, the poor bees being smoked to suffocation, and we had not sense enough to know it. But as every thing has an end, so did that transferring job end also. The other hive went off a little better; yes, a good deal better, and the last was just fun.

Let me tell a little I did not find in the books. For a support for my frames and combs in fitting, I laid two Simplicity covers side by side; had a cloth nearly large enough to cover both, fastening it at the outside corners, letting one edge of the frame lie near the division in the center. The comb being in, I slipped the wire clamps on one side, then raised both covers to an erect position with the frame between, then tipped the frame against the opposite cover, laying them down as before, leaving the other side up to clamp also. By doing this I had no trouble with slipping combs. After a while my bees began to swarm, and I hived them all right, with the help of my wife, whose father used to keep bees on the "gum" plan.

During the summer I formed two nuclei, and got good queens both times. I placed a frame of capped brood on each side of one containing eggs, being sure the eggs were at the bottom. Then I moved a strong colony to a new stand, setting my new swarm in its place, making the change during "working hours." A part of this was a little different from the books, but it worked well with me. I put on top stories without foundation in them, and I'll never do so again, unless I have frames of empty comb. When they were filled, oh what a mess! Instead of the bees building down, about two-thirds their combs were built up, and crosswise at that. The only way I could get at the frames was to loosen the whole business, and turn them out on a board.

Now I'll tell you how I fixed the colonies for winter. I was so busy I did not get them fixed up till it was quite cool. "All wrong," you say; well, I know it, and will try not to get caught that way again. It was so late in the season I thought best to take them a hive at a time in an empty room with a fire. I did so; commenced with the heaviest first, so as to have supplies, should any be weak. I left in from four to six frames, according to the size of the swarm and weight of the frames. For division-boards I used a board the size of a frame, with chaff cushions at the bottom and ends. Why I used this, was because I did not have the thin sides for the regular board. I

packed back of these with oat chaff; laid sticks on the frames, put on a top story, put over the frames a piece of coffee-sack, filled the top with chaff, put on my cover, and took them to their summer stands, having previously got the few bees that went to the window into the hives the best I could. I will let you know their condition in the spring. I began with three colonies in the spring, and increased to ten. Shall trust chiefly to natural swarming for increase, until I learn other methods better.

A. B. WARNER.

White Rock, Kan., Jan. 7, 1884.

MOVING BEES TO CATCH THE BASSWOOD BLOOM.

I AM about to bother you with one of my latest hobbies. In this locality the first of July finds our pets strong in numbers, but with nothing to do. White clover usually gives out by the last of June; basswood is not very plentiful; and besides that, it usually opens about the 20th of June, and falls by the first of July; after that there is scarcely any thing for the bees to get. As I am situated at the terminus of the Wheeling, Lake Erie & Marietta Railroad, I have a plan under consideration to try the feasibility of moving a carload or 100 colonies of bees to some point between here and Toledo, on said road.

Friend C. G. Knowles, of Portland, O., was here to-day, and we had a lengthy discussion on the subject, and came to the final conclusion that, if possible, we would try the experiment this season if there is a basswood bloom in prospect. During our conversation we naturally drifted on to the preparation of the bees, and especially the best methods of finding a suitable locality, where we would not interfere with the interests of any of our brother bee-keepers. As the experiment would interest many of our bee-keeping friends, we rather reckoned on your assistance; that is, such advice as you might be able to give us. At any rate, we should like to have your opinion on the subject as early as convenient. I think that the expense of moving bees both ways should not exceed 75 cts. to \$1.00 per colony.

We could be up there the first week in July. We should probably get the whole basswood season. Rousing colonies, as we should have at that time, would no doubt pile up the honey very fast. I am just now thinking what fun it would be, after the honey season was over in Ohio, to jump another 300 miles, and catch another honey flow. But then, we will try one at a time. If I am correct, the basswood-trees form the buds and leaflets 3 or 4 weeks before they open and secrete honey, which should enable us to ascertain in time whether to move or not. We would, of course, give an account of the success or failure, in GLEANINGS, in due time.

Marietta, O., Jan. 8, 1884.

R. STEHLE.

Friend S., I think you are on a track that will be vastly more feasible, at least for the present, than planting forage for bees, or almost any thing else. It has been proved beyond question, that it is not a difficult matter at all to keep the bees right in the midst of the height of basswood and clover, for at least many months. You remember that I told you, two years ago, about a colony that gathered 18 lbs. in a single day from basswood bloom. They were on the spring scales, so there was no mistake about it.

They made very good results for several days. But within a week after this great yield they tapered down to nothing, and then we had robbing and all such like work. Well, after our bees had been entirely out of business for two or three weeks, I took a trip up into Michigan, and found a friend there right in the height of a beautiful basswood flow, and there would have had been ample time for us to have moved up there half a dozen times. One of the main points to consider is, to find heavy basswood timber right along some main railway line where we can get a regular rate of freight at low prices. I think I would have bees enough to fill a car, and then go right along with them. One or two hundred miles at a time is as far as it will pay to go. Either go over the route beforehand, or by correspondence have every thing arranged so as to know just where to go. There are many large heavy tracts of basswood timber, and I am well aware it will pay splendidly to move our bees into the vicinity of these large tracts. As clover is usually found near basswood, we ought to manage so as to strike near both as much as possible. As a general thing, I believe clover honey commands the

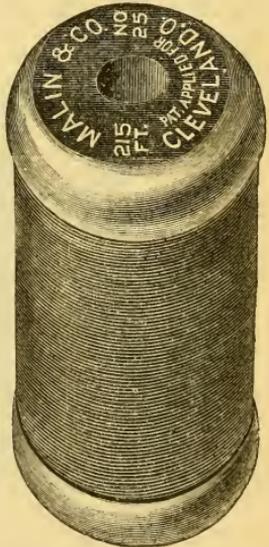

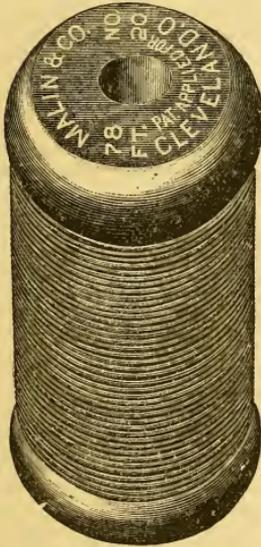

best prices. If you get a car, I think it can be managed so that the expense will not be more than 50 cts. per colony, each trip—that is, where you manage to have from 100 to 200 colonies, by clubbing with your neighbors, or otherwise. In a good locality, in the height of the basswood flow, 200 colonies would do very well in one locality; but it would not be a great expense to scatter them a little by putting off, say 50 or 100 at one station, and as many more at the next, and so on. Hives should be light, and combs as nearly empty as possible, without endangering the bees from starvation. Some arrangement should be made for quickly fastening the combs. Spacing-boards are the best of any thing I know of now. Simplicity hives, with wire cloth over both top and bottom, will do the business nicely. A very light cover might be used for these summer trips; or if you are all the time in the honey-flow, perhaps you could get along without any bottom-board at all. Who can give us some facts from experience in just this kind of work? I believe it was practiced by quite a number of the brethren during the past season. If they will speak out, we will try to give them space.

A BIT OF WIRE.

ANOTHER IMPROVEMENT IN HOUSEHOLD CONVENIENCES.

DEAR FRIENDS, did you ever want a bit of wire when you could not find it? and did you ever have a bit of wire get tangled between your legs, and almost trip you down, when you did not want to? Well, the engravings are intended to illustrate a way of remedying both of these evils at one clip. It is a plan to kill two birds with one stone, you see. I suppose you know that I have for years had copper wire wound on spools, on our five-cent counter. I knew when we started them that they were going to sell, for I was well convinced that one who had discovered what could be done with a little spool of soft wire would never afterward be without it. I think I got the idea from the *American Agriculturist*. Well, our trade has run up so that I have sold hundreds of pounds at 5 cents a spool. And just now some of

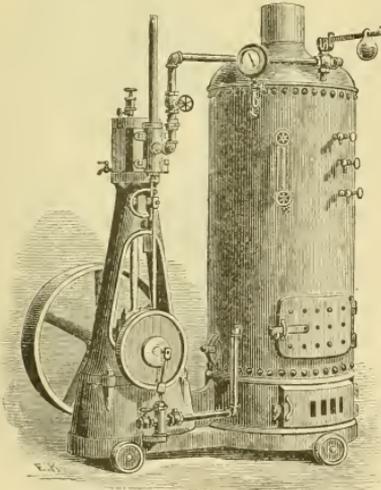

our enterprising neighbors in Cleveland have started a business of winding wire of all kinds on spools. Each spool has a wire nail in the right place to twist the end of the wire around so it will not get loose, and snarl. Did you ever try to get wire out of a snarl? Well, with these spools, if you take any kind of care, you need never have a snarl at all. Just wind off what you want, catch the end around the nail-head, put it in your pocket, or put it away, as you choose. We have now in stock the sizes shown in the pictures, besides galvanized wire for the grapevines, put up in the same way. The price of the latter is 20 cts. per spool; \$1.80 for 10 spools, or \$16.00 for 100. If wanted by mail, 20 cts. each spool for postage. Notice how neatly the number of the wire and the number of feet on each spool is printed on each one. The two sizes shown in the cuts are annealed iron wire, shellac coated, so it will not soil the fingers. The price of these is 10 cts. per spool. Finer size, No. 25, you get 225 feet for 10 cts., or 24 feet of wire for one cent, and the spool thrown in. The postage on these sizes will be 7 cts. each spool. Prices by the quantity, 85 cts. for 10, \$7.50 per 100. On the 5-cent counter we have our usual copper wire put up on 5-cent spools.

ENGINES FOR BEE-HIVE MAKING.

WHAT SIZE SHALL A BEE-KEEPER BUY?

A GOOD many of the bee-friends make their own hives by foot-power buzz-saws; but those who make them the old-fashioned way, with the hammer, saw, and plane, are now very few. With his foot-power saw a man can earn very good wages indeed, making hives for his own use; but as I have so often told you, it is pretty hard work; and if he is prosperous he will very soon want a little engine. Our 2-horse-power engine at \$175 will be appreciated amazingly after having made hives for a season or two by foot-power. But by and by the neighbors around him get into bee-keeping, and want hives also, and pretty soon people come from a distance to get supplies from him, especially if they find out that he has them on hand ready to load up when wanted. As the business increases, and he gets to making comb fdm., and section boxes also, a still larger engine may be needed—a 4-horse-power, for instance. During this season quite a few of those who have been several years at work are wanting something larger still; and therefore we have been obliged to look up a 6-horse-power engine, as I told you in the issue of Dec. 1. Below we give a cut of this 6-horse-power engine:

OUR 6-HORSE-POWER ENGINE FOR BEE-HIVE MAKING.

Unlike the cheaper ones, this boiler is wrought-iron tubular, and the whole is furnished complete, with all modern improvements. Further particulars will be given on application. We have just traded for a similar 6-horse-power engine that has been used only one year. We got it from our friends Smith & Smith, Kenton, O. Their business has prospered so much that they have started quite a large shop, with all improvements for doing a heavy business. The engine has all been painted up, and would readily pass for one that had never been used at all. We took it for an accommodation

toward bee supplies and other machinery, and can furnish it to any one who needs such an engine, for an even \$275. Full particulars will be furnished by us or friends S. & S., if any of you should be in need of one of this size.

THE OTHER SIDE OF BEE CULTURE.

SOME REBUTTING TESTIMONY.

FRIEND ROOT:—As I have always taken a back seat, and listened to or read what others had to say through GLEANINGS, and, having never intruded on your valuable time, I would like now a little space to tell what I know about

FARMING AND BEE CULTURE.

My reason for so doing is W. Z. Hutchinson's two last articles on the "other side" of bee culture. I think he is hitting just such as I when he hints that bee-keeping should be a specialty, in order to be a success, and that farmers can buy their honey cheaper than they can produce it.

Now, I have all due respect for friend H., and think very highly of him and his writings; and since my acquaintance with him some four years ago, I have read the "Notes from the Banner Apiary" aloud to my partner, first, on the receipt of GLEANINGS. I like his articles, because they are so free, generally, from theories, which is, I think, a great fault with the writings, to a great extent, in many of our leading agricultural and bee journals. Now, to be a successful farmer or apiarist, we must read in order to be posted and keep up with the times; and then we must have an average amount of judgment and common sense, in order to discern whether it is theory or practice we have been reading; also to discern what will answer in our locality; for what will be a success with Jones, Dadant, Doolittle, or Hutchinson, might be a total failure with me. Knowing this, then, let us be careful about crying humbug, or theory.

Now, I want it understood that bee-keeping has been a secondary business with me, doing my bee-work in the form of an odd job, as I could get the time, working regularly with my man at farm work, and I have the name of raising crops second to none in our locality. Now for the results of bee-keeping in a condensed form, for the last three years: Whole number of swarms owned in the three years, 105; whole number worked for honey, 48, spring count; sold 7 full swarms; lost by wintering, 52; cash receipts for the three years, \$937. Now, I am not making this report to incite any one to false hopes, nor to brag, but to show what can be done by one who is not a specialist.

In another article, if you like, I should like to give my views as to the coming bee; how I do my bee work, and something in reference to buying bees by the pound. Friend H. speaks of "hawking honey" on the streets. Now, if he is willing to sell at wholesale, to a retail dealer, so, he can make a profit, he will not be troubled with "hawking;" but if he wants the retailer's profit, he must expect to do the retailing. For me, I rather like that way of selling honey. I can take my team in the winter, when they or I have not much to do, and sell at retail, in almost any of our villages, from \$10.00 to \$15.00 worth of honey in two or three hours.

Now, friend Root, I think you will bear me out in saying, that if we take the standpoint of capital invested, the failures in bee culture are but small in comparison with most other branches of business.

Millington, Mich., Jan. 11, 1881.

M. D. YORK.

FROM THE BOX-ELDERS.

MR. DUSTER RESUMES.

IT has been some time since we have heard from Mr. Duster, although we have interviewed him often the past summer, but were too busy ourselves to report. Early in December we saw, in passing, that his bee-yard was all cleared up—nothing in sight where there had been a small city of white bee-hives a few days before—all gone but the honey-house.

As we stood among the trees, with which the yard is liberally sprinkled, we were joined by Mr. Duster with "Yes, all in the cellar, snug, quiet, and warm; and as they had a good fly just before I put them in, I hope they will remain quiet until pollen comes next season. Every year I am more convinced we should not hurry our bees out in the spring, as a rule. I used to get them out about the 10th of March; in fact, I have had them carrying pollen the 15th; yet, just so long as they can be kept quiet, just so long let them alone, is my practice now.

"THE SEASON,"

said Mr. Duster, going on with the conversation, "I need hardly say, has been a very singular one in many respects. The electrical and atmospherical conditions surrounding our earth have been wonderfully disturbed. We have had winds and floods, hurricanes and cyclones, earthquakes and volcanic eruptions, until old earth has fairly rocked and reeled in mighty throes. Now, you see, with Teice down here in St. Louis, and Vennor over in Canada, across the line—position couldn't have been worse—the one predicting this and the other that—both trying to run the weather, and neither of them knew how; why, I don't wonder old mother Earth got the dyspepsia, like the rest of us—had a bad headache, with wind on her stomach, and a tremendous movement of her bowels—do you, eh? No; well, now Teice is dead, and Vennor comparatively quiet, I think the weather will resume its normal condition, although I wouldn't bet on it while Vennor lives.

"There never was a better show for honey, the first of the season, than we had in Northern Illinois. We had seas of white clover, and yet six to ten days of moderate yield was all we got. Half a crop is as much as the results will show. White clover failed to secrete, while, as I said before, there was a wonderful display of flowers, electrical conditions were not in favor of secreting the nectar. Sometimes I think I can tell by my senses just when the atmosphere is in right condition to secrete honey. Yes, I have often said to myself when away from my apiary, 'This is good honey weather—the bees are at work;' and when I go to see, I am hardly ever disappointed."

After disposing of weather and results of the season, Mr. Duster proceeded to discuss, with a good deal of animation,

SECTIONS AND SEPARATORS.

"I wish they would settle down to something—I don't see any use for half a dozen different-sized sections. Look at the bother, to say nothing of the expense of it. I don't believe it's going to pay; one wants as many sizes of cases to ship—different size of glass, and so on, as he has sections. Yes, and then what about the sections? In my opinion, I am fully satisfied that the bee-keeper who ships his honey can never use sections 2 inches wide, whether 1 lb. or 2, without separators, with satisfaction. I say this

after a great many trials and tribulations, in fact, and for these two reasons: First, I believe it is truth; second, it keeps a man from the strongest temptation of his life—to swear, inside or out. I can't tell it; how good a man feels as he packs in neat cases the beautiful white sections of honey for market! he is proud of it, as he has a right to be, and, of course, happy too. But just at this time he comes across one of these hateful, miserable sections—measly is no name to express it; with one side with a sickly cave-in, and the other swelled out as if it had a bad case of mumps, or something! Oh! I don't want any in mine, if you please.

"Now as to boxes $4\frac{1}{4} \times 4\frac{1}{4} \times 1\frac{1}{2}$ and $1\frac{1}{2}$ inches wide: If we can not get along with them without separators, then farewell to all boxes less than one pound. I am in hopes we shall succeed with these narrow sections; but if they are unreliable, or are not pretty free from the trouble we have just been talking about, I shall relegate all but the 1 and 2 lb. sections to everlasting limbo."

FEEDING BEES.

"Yes, I have just been reading about it, and this is my way. If I feed to supply stores, I put an 8 or 10 lb. pepper-box feeder directly on the frames, and make a short job of it. If I feed for stimulating, I tip the hive back, the bottom-board being tight, pour the feed from a tin pot, made for the purpose, into the entrance of the hive. I can feed fifty stocks this way as quickly as I can ten in any other. How about robbing? Yes, I've seen the cautions; that is all very well; but I hardly think one of them has ever tried it. You must not suppose a man of sense will feed this way at all hours of the day. You don't suppose bees will rob or learn to rob after it is dark, or late sunset, especially if you are feeding dissolved sugar, as you ought to do? No, I guess not.

"Now it is wonderful," said Mr. Duster, emphatically, "how experiences differ in different localities, and yet, perhaps not more so than many farm crops, when we stop to compare. Here are a few

"EXPERIENCES

I have never had, and some that I have. Spring dwindling I never had. This is the reason: I don't winter outdoors to make 'em tough (?) you know! Foul brood I have never had any experience with; think it is not in this part of the State. I never had robbing in my apiary. Dysentery I know something about, although I have never lost a stock by it yet. I will only say this in regard to it: I think Quinby is right—cold and dampness do it. Heddon is right—pollen does it. Duster is right (sure, pretty sure), sour honey does it; and Novice is right, for you and I know there's belly-ache in sweet cider—sweet cider does it. What do I mean? Why, I mean that several things or conditions will bring it on. It comes over no royal road, but over many—I don't care to discuss it—that's all."

Here Mr. Duster branched off and commenced to talk about bees, and his bees in particular.

"I claim no superior excellence for my bees over others; I think them good. Every one who has been in the business as long as I have should have good bees, and not be particularly smart either.

"I started with the brown bee—great, good-natured fellows (?) who would come out on the alighting-board and bid you a friendly good-morning, wagging their heads this way and that, so knowingly one was almost ready to believe, as they could not tip you the wink, why, they would do the next best thing—nod their little heads in friendly recognition.

"Some twelve years ago I crossed them with Italians. I found, that somehow large individual yields almost invariably came from hybrid stocks, and these of the first cross — did not extend to further crossing. Stick a pin in there, will you? I kept a good portion of my stocks pure Italians, besides infusing fresh blood into them; yet these brown bees, with a little help outside, seemed determined that the Italians should not wear all the finery, but must divide with them. Some four years ago I commenced crossing my Italians with Cyprians. Now let me say, I do not have to protect my yellow bands. This state of things was especially noticeable this season — they have crowded out the hybrids wonderfully. This power of prepotency they seem to have prominently. It must be this, or else this cross has produced drones more active than others — perhaps both. From the experience I have had, I should judge that a cross of dark Italians with the brown bee would, in a few generations, if not constantly supplied with fresh Italian blood, produce nothing but brown bees. Solid colors in crossing will always assert themselves, other things being equal. Take, for instance, the Plymouth Rocks. They are a cross of, say, thirty years' standing, and yet a few years ago they would throw a completely black chick now and then, showing that the solid black color of the Java was still asserting itself over the hawk color of the Dominique. I have had the Plymouth Rocks for many years, and have to use the utmost vigilance in mating, to keep them near the standard. And I will add, in closing, that they are a splendid bird, and worthy of any pains one may bestow upon them. No birds for sale."

R. H. MELLETT.

Amboy-on-Inlet, Ill., Jan. 5, 1884.

HUBER THE GREAT NATURALIST.

Also Something in Regard to Ancient Bee-Authors in General.

OLD BOOKS ON BEES.

IF you can not procure a copy of Huber (noticing in GLEANINGS of Dec. 15 you want one), I shall be pleased to lend you mine. It was printed in London, 73 Cheapside, 1841; has an abridged life of the author, from De Caudville, "Life and Writings of Francis Huber." A few extracts may be interesting to the readers of GLEANINGS.

He was born at Geneva, July 2, 1750. At the age of fifteen his sight began to be impaired, and in a few years he became totally blind. When any one spoke to him on subjects which interested his heart, his noble figure became animated, and the vivacity of his countenance seemed by a mysterious magic to animate even his eyes, which had so long been condemned to blindness. He was married to Maria Aimee Lellése, the daughter of a Swiss magistrate, and the marriage was in a high degree romantic. The attachment had begun in their early youth, but was opposed by the lady's father on the ground of Huber's increasing infirmity. The affection and devotedness of the young lady, however, appeared to strengthen in proportion to the helplessness of their object. She declared to her parents, that, although she would have readily submitted to their will, if the man of her choice could have done without her; yet as he now required the constant attendance of a person who loved him, nothing should prevent her from becoming his wife. Accordingly, as soon as

she had attained the age (twenty-five years) which gave her a right to decide for herself, she, after refusing many brilliant offers, united her fate with that of Huber. The union was a happy one. She was spared to him forty years; and he says, as long as she lived he was not sensible of the misfortune of being blind. He died in the arms of his daughter, on the 23d of December, 1831, in the 81st year of his age.

He was a great naturalist — one of the greatest. He confirmed the discovery of the origin of wax, by experiments. He discovered the impregnation of the queen bee, and made observations on retarding the fecundation of queens beyond the twentieth day, etc. The publication of his observations took place in 1792.

I have several other old works, some very quaint and curious, and some very interesting, among which are the works of Warden, published in 1749; Thorley, 1744, and the work of the old bee-master Butler, published in 1673. Also the work of Purchas, printed in 1657. I will copy the title-page. It reads thus: "A theatre of Political Flying-Insects. Wherein Especially the Nature, the Worth, the Wonder, and the manner of Right-ordering of the BEE, is Discovered and Described. Together with Discourses, Historical, and Observations Physical concerning them. And in a Second Part are annexed Meditations, and Observations Theological and Moral, in Three Centuries upon that Subject. By Samuel Purchas, Master of Arts, and Pastor at Sutton in Essex. Entered according to order. LONDON, Printed by R. I for Thomas Parkhurst, to be sold at his shop, at the Three Crowns in Cheapside, over against the Great Conduit 1657." Then comes six pages of "The Epistle Dedicatory," followed by "The contents of the several chapters," and "a list of such Authors as are cited and made use of in this Treatise." The names of over three hundred authors are given in alphabetical order; among them I notice that of Esop, Aristotle, Columella, Hippocrates, Homer, Sophocles, Josephus, Varro, Virgil, and others.

Frequently, during a dreary, rainy winter evening, I get these old books out, and their curious get-up is so new and strange, an hour or two or more is profitably spent in examining, studying, and contemplating the books and their authors. Long P's for s, and big C's and T's connected. Do you think your A B C book will ever look as old-fashioned, and behind in the art preservative, as these appear?

The minds of good women and great men frequently run in the same channel — they think alike. Peter was the name given a son of Mr. and Mrs. Huber. Did he not, too, become a naturalist, and write of bees, ants, and wasps?

W. P. HENDERSON.

Murfreesboro, Tennessee, Dec. 24, 1883.

Indeed, friend H., we are much obliged to you for your kind offer. We thank you, besides, for the glimpse you have given us of the writers on bee culture centuries ago. We have here in the office one or two works over 100 years old. But when you speak of going back to 1657, you leave us away out of sight. By all means, loan us that book on Huber. Send it by registered package, so it will not get lost. If I understand you, it is written in English. Was it not first written in another tongue, and then translated into English, or have I been misinformed? I should like the original, if we can get it, if we can get a modern translation made.

While at the Toronto Convention, Mr. Langstroth gave us quite a talk, mentioning many of the very same books you have cited. If I remember correctly, he said the only translation of Huber that we have in English is a very poor one.—Little Huber is daily waxing strong in body and mind, and his favorite pastime is now to get up on his feet, with a little help, and then sit down again, and keep doing the same thing over and over.

HOW I USE SINGLE-STORY HIVES.

SOME GOOD SUGGESTIONS BY FRIEND POPPLETON.

Concluded from last issue.

THE details of the work I will now describe are the ones I use when work is crowding, and there is plenty of available help. Of course, they can be, and are varied at other times; but I find it pays well to use all the help we can at once, finishing up as quickly as possible, then do the general apiary work until hives are nearly full again, when the same is done over again. Myself and assistant usually handle the combs out of doors; shaking off bees, wheeling full combs into the shop, etc., while one good active hand does the uncapping and extracting. For the last two or three years my wife and my assistant's wife have done the extracting in the shop, cleaning off frames, and sorting over combs ready to be taken out into the apiary again. I like the last way the best, as the two can do the work easier and better than one strong hand can do.

For carrying combs to and from the apiary and the shop, I have several boxes made of very thin stuff, with tight cover, so they will exclude robbers, if necessary, and are large enough to hold 12 or 14 frames. These are carried to and from the apiary on an ordinary wheelbarrow.

When ready to commence extracting we go to several of the strongest colonies, taking from each a couple of frames of brood, until I have as many extra ones as I need. Some 20 of these are needed, and, of course, are to be run through the extractor before using. These, together with enough entirely empty combs to make two sets are needed; that is, we have to have two extra sets of combs all the time, one set being extracted from in the shop, and the other being given to the colony that we are working with outdoors.

As soon as every thing is ready for the real work, my assistant brings out of the shop, on a wheelbarrow, one full set of combs, the ones containing brood in one of the carrier-boxes, the empty combs in another. I lay the cover of hive we are to work at on the ground immediately back of us, and on it a box made purposely for this work, same size and shape as a standard hive, but of very thin, light material. We then remove into this box every comb in the hive that contains a sufficient amount of honey to pay for extracting, and then replace them by the set of empty combs, my assistant handing me the combs while I place them, and close up hive, except putting on cover. We then shake and brush the bees off the combs directly in front of the hive, placing the full combs, as fast as cleared of bees, in the empty carrier-boxes on the wheelbarrow. We find it facilitates the work of extracting in the shop, if we put all the combs containing unsealed brood in one box by itself. The assistant then wheels the full combs into the shop, and brings out the other set of

empty ones, while I am commencing the work of handling combs in the next hive, and so on all day. The last work we do at night is to go to the colonies we want to commence with in the morning, take away all combs that do not contain brood, and in their place put the two extra sets of brood combs we have left over. The brood combs not taken away from these colonies are taken next morning, thus keeping us all the time supplied with the necessary extra sets of brood combs. If at any time while extracting I have any weak nuclei that need strengthening, I give them a frame of brood each, it being less trouble to do this work then than at other times.

In the shop I use two uncapping-cans, or, rather, boxes, and two extractors. This is not so much to facilitate rapid work, as it is to enable me to keep the honey strictly graded. Some of the combs the first time through them in the season will contain a small amount of dark honey left out of their winter stores, the honey from these being, by the use of the second extractor, kept separate from the rest. This is very important, if one sells in the wholesale market.

The honey, as fast as it is extracted, is run into deep tin cans holding nearly 400 lbs. each, where it is allowed to remain as long as possible, when it is drawn off through molasses-gates near the bottoms of cans, into whatever vessels we may be using for permanent storage, the cans being set up for this purpose high enough to allow our largest-sized barrels to be rolled under them. I always allow the honey to remain in these cans over night anyhow, and as much longer as I can do without the use of the can. This not only saves straining the honey, as all foreign particles rise to the top, where they can be skimmed off, but the thin watery honey, if there is any such, will also rise to the top, and need not be drawn off into other vessels until it has had ample time to become evaporated.

FALL MANAGEMENT

Consists simply in taking away all surplus combs and honey as soon as the honey season entirely closes, usually with us about the 1st of September. I never leave more than 8 combs during the winter in each colony, and less than that number when colonies are not very full and strong. Of course, I always select the best combs in the hive to leave for winter, and find it is quite an advantage to have a chance to select the best out of 15 to 25. Those having the largest amount of sealed, and the least unsealed honey, are the best. All further management during fall and winter is the same as with double-story hives, and need not be detailed here.

FRAMES.

What shape of frame is best adapted for use in single-story hives? The answer to this must, of necessity, be partly theoretical. I prefer and use a frame 12 inches square, one very similar to the American frame; but one of my near neighbors tells me that he has had excellent success with the shallow Langstroth frame, so I do not consider any particular shape of frame an essential feature of single-story hives. The deeper the frame, the more compact is the entire arrangement, and I am satisfied better results can be secured. If I were to change the shape of my frame at all, I think I should retain its present depth, and make it longer, somewhat like the Quinby frame.

BEEES.

What kind of bees give the best results in these

kind of hives? is a question much more easily and surely answered than one can tell which is the best frame. I get very much the best results from my purest and lightest Italians. The Italians seem to be much more disposed to partially stop brood-rearing, and bend all their energies to honey-gathering, whenever there is a heavy flow of nectar, than any other kind of bees I have tried, and this is a very great advantage.

As I said at the commencement of this article, I have not tried to discuss any of the advantages or disadvantages of the single-story system, as compared with double stories, nor to give theories,—only a plain statement of how I have used single-story hives in my own apiary for several years past. Neither do I think my manner of work is original with me; nearly or quite all of the items of it having been already published in the journals, only not in a connected form. Neither do I want it understood that I think single-story hives are the best for use in all localities, and in the hands of all bee-keepers; but I do think that there are a great many localities and a great many bee-keepers who can be more successful with this form of hive than with double-stories; and if my plain writing will be any help to any one, I shall be satisfied.

O. O. POPPLETON.

Williamstown, Iowa, Dec. 10, 1883.

Many thanks, friend P., for your excellent paper, telling the way in which you use single-story hives. The very point you make in making it valuable is, that you have a complete system of working. I know that very much of the labor of extracting may be saved by keeping an extra set of combs, such as you mention, for we once followed the same plan during one season. I was at one time a little inclined to think, however, that the bees seemed to do better on their own combs than on a set of combs belonging to their neighbors. This, however, may have been only a notion of my own. It seemed to me, too, that the bees cared for the brood with better economy where it was put back into the hive in pretty nearly the same relative position it originally occupied; that is, I thought they were a little mixed up for a time when I changed the combs about promiscuously. Where one works for extracted honey exclusively, I have no doubt but that a long single-story hive, and a frame a little deeper than the Langstroth, might be an advantage. Friend Dadant already uses the Quinby frame you allude to, and he is a very successful producer of extracted honey. Our friends will remember that I once adopted into our apiary this form of hive with the Adair frame, and we have some old lithograph drawings now, picturing an apiary and a hive of this description. That was the time when we used to make bee-hives and print GLEANINGS by windmill power.

BEES AND SUNDAY.

WHAT SHALL WE DO WITH THEM DURING SWARMING-TIME?

I HAVE been pleased to have "Bees and Sunday" discussed in GLEANINGS. I very much wish that you would continue the matter, as I, and I presume others, wish to see the matter in all lights before we can decide intelligently as to our duty in the matter. We know that it is right to milk and feed

the cows, as their comfort depends upon it. This matter of Sunday labor is very perplexing. Not long since I heard a boy question whether his mother did right to put out her dried fruit on Sunday, and ask why that should be brought in when rain threatened, any more than the hay in the field. A lady who thought herself right in going to the lake on Sunday, blamed others for playing croquet while there, because it was Sunday. Most people would think it right to go after their cattle, if they should start to run away on Sunday. Possibly our lesson gives us a hint on this subject. 'Those sheep and oxen were valuable property. Yet, "to obey is better." If wrong to hive bees on Sunday, we should like hints to prevent their swarming. I will give one. Do not disturb or handle them for several days before Sunday, if swarming is feared. They often swarm soon after being smoked, and having honey taken.

I think my bees obtained a good deal of honey this fall from the tamaracks, but no perceptible surplus. The trees were plashed with a clear sweet liquid, and the bees worked on them morning and evening. I found no trace of insects. They also obtained honey from the willows, whenever it was damp. The willows were well covered with a cochineal insect. Sometimes you could see a shower of tiny drops. Things under the trees became sticky, as well as the leaves.

MISS L. WILLIAMS.

Delavan, Wal. Co., Wis., Nov. 9, 1883.

The instances you mention, my good friend, help us to see how difficult it is to lay down positive rules for anybody. I confess I am unable to decide what is right in regard to this matter of caring for stock, running milk-wagons on Sunday, and things of that sort. In almost every case, circumstances would have to be taken into consideration. But we can have this to comfort us: That where we do the very best we know how, according to the dictates of our own conscience, we shall not get very far astray. We know that Jesus went about doing good on Sunday, and also that he taught the people on the Sabbath-day. I do not mean to say in the above, that I am unable to decide what is right and proper for me to do in regard to the matter of the observance of the Sabbath. The thing that troubles me is to decide for my neighbors what they ought to do, especially when they have not asked me to decide. You know our Savior said, in such cases, "Judge not."

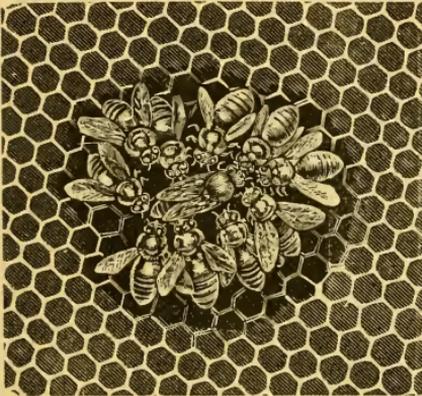

HOW TO FIND THE QUEEN.

HOW MUCH DIFFERENT IS SHE IN LOOKS FROM THE OTHER BEES?

ONE of the juveniles says in this number that he has looked and looked, and can not find a queen, or any thing like one. I had to smile a little while reading his letter; and one reason I smiled was because it reminded me of the time when I could not find a queen. I wanted to get out a black queen so as to get in an Italian, and I hunted the bees over till it was a wonder they did not get out of my patience, and sting right and left. Sadly and sorrowfully I shut up the hive, and mused over the matter a spell, and went and opened it again, and went through the same performance, looking for the queen for a half-hour or more. Fi-

nally in despair I told my wife I should just like to see Mr. Quinby or Mr. Langstroth find that queen, and that I would give pretty nearly a five-dollar bill to see them do it. Years have passed since then, and I have got over the difficulty of finding queens, like almost any other difficulty; and for the encouragement of the juveniles, and some of the older "niles" too, I will say that we can get used to almost any thing that anybody else can do, so as to have it at our fingers' ends, as it were.

Well, what I started out to say was this: That one great trouble with my early efforts was, I was always expecting the queen to be something very much different from the other bees. Of course, I did not really expect her to be as large as an ox, but just thought, from the pictures in the books, that she would be very large and tall, so as to stand head and shoulders away over the rest; whereas the truth is, unless we look into a hive when the queen is in the height of her laying, she does not look so very much different from the worker-bees, and therefore we are to find her more by the attitude and behavior of the other bees toward her, than from any great difference in looks. In order to show you just exactly what a queen looks like, I have been at some expense in having an engraving made from a photograph of the queen and bees, just as they stand on the comb. Here it is:

THE QUEEN AND HER RETINUE.

She looks rather insignificant, does she not, little friends, compared with queen-bees we see in the advertisements? Nevertheless, I think the picture is a pretty truthful one, both of bees and queen. After your eye has been educated to catch the slightest glimpse of the peculiar action of the workers when near the queen, you will learn to hunt her almost without knowing it. Your eye finds her, and I have seen some of the juveniles whose eyes would pounce on a queen (if that is the right expression) quicker than either father or grandfather, even with the aid of their spectacles; and these little chicks do it by noticing the behavior of the bees. Do you not see how they all stand around her, putting out their antennae, or feelers, very much as you put out your hands and lips to

the baby in a caressing sort of way, giving him a kiss on top of his little woolly head, or perhaps his shoe, or plump, fat leg? They seem to love their queen, and like to touch her and caress her. When she walks toward them, those before her stand out of the way just as you would back off for the baby, when he is learning to creep. They will twist around, and sway their bodies in a graceful sort of way, just as you see that bee at her left hand curving his body as she comes around. In fact, these motions have become so familiar to us that I have been in the habit of telling the boys, as soon as they pick up a comb. "There, boys, you will find the queen on that comb, on one side or the other." Now, I had not seen her at all, but I knew pretty well by the way they acted, that they had just been paying their attentions to her. You will notice that the queen is in size almost the same as the bees around her. It is, in fact, the difference in shape, rather than the difference in size. Her wings lie close to her body, as you see, while the others are all spread out, more or less. Her body is also slim and pointed, while others are blunt—more like that of a drone. By the way, we ought to have had a drone in that group, but I did not get him. If any of you can give me a good photograph of a drone, I will pay for all expense and trouble. Perhaps some of our amateur photographers who keep bees might manage it. I suppose the queen we have pictured here was taken out of season, when she was laying very little if any. During the height of the honey season she would lengthen out nearly a half longer. But her wings and body and head would be about the same. You will notice her shoulders are larger, and differently shaped from those of a worker-bee. I often find her, just by getting a glimpse of that part of her body. Now, then, when you look for a queen again, see if you don't succeed better.

In closing up this article in regard to finding queens, we venture to put in a little picture we used some time ago in the Merry-banks stories.

HUNTING FOR THE QUEEN.

You see, our old friend has so much trouble in finding the queen that he has got a label made to paste on her back. Every thing is all fixed, as you see; but, alas! he can not paste on his label, because as usual the queen is nowhere to be found.

SEPARATORS, HIVES, AND CASES.

AND SOME OTHER REMARKS CONCERNING THE PRODUCTION OF COMB HONEY.

FRIEND PORTER, in giving us the following good items from his experience with separators or no separators, adds, in a private letter, the following. I have taken the liberty of putting it in here, because we usually have a desire to know how much of a producer a man is when he writes on questions of so much importance. I am glad to be able to state, that friend Porter is emphatically a successful producer of nice comb honey.

"I have been quite successful, and produce more honey than any other man in Virginia that I know of. Many of my colonies stored 200 lbs. and upwards, each. I think no such results would be possible here, with Heddon's system."

FRIEND PORTER'S ARTICLE.

Friend Root:—In view of the reports of W. Z. Hutchinson, Mr. Heddon, and others, showing such success without separators last year, it appears that it must still remain a mooted question. I, too, made repeated trials in 1883. With sections two inches thick and with full-sized starters of foundation, I was invariably obliged to watch, and cut away new combs started on the edges. In some cases this was done four times before the sections were filled out, and it had to be done every day. The result where the sections were completed was very unsatisfactory, for many were bulged out so they could not be crated. Repeated experiments had the same result. Having no narrow sections, I tried some. It is very likely, that with $1\frac{1}{2}$ or $1\frac{3}{4}$ inch sections, better work will result. But there is another very serious objection. Many object to the plan of tiering up, claiming that the honey is cleaner and better if removed often, and just as soon as it is capped. Tiering up, I judge, is essential to success with Mr. Heddon's system, for his hives and cases are so contracted in width that he has to make room above. Using a ten-frame hive and case to fit, I practice tiering up, and regard it as very important, in the height of the honey season, to afford room for the great number of workers, as it helps to prevent swarming. But we all have less prosperous colonies, which do better work without, and such need to have room made by taking out sections just as fast as they are capped.

Now, the difficulty without separators is here seen in another light. Put in new sections with starters beside those nearly done, and watch the result. I venture to say, that in nine cases out of ten the result will be too irregular to crate. In the discussions so far, this appears to have been left out. It has a very important bearing. I can not but think, and I am not alone in this, that Mr. Heddon is on the wrong track with his narrow hive and narrow rack, and that many who are adopting his plan will regret it. I have practiced for two years the plan of contracting the ten-frame hive to eight, seven, and nine frames of brood at the time of putting on cases of sections by the use of dummies, or thick division-boards at the sides, and thus forcing the bees right up. By doing this we have all the advantages he claims, with the added one of having a ten-frame hive to use for extracting when needed, and, what is of great importance, to hold the bees we want for box honey till we get them into the boxes.

In another respect, Mr. Heddon's system is open to criticism. His cases are too slight a protection against the great and sudden changes of temperature which come upon us, even in May and June. If heat, so essential to comb development, is produced internally to a degree that withstands these cold nights and days we often have, it must be at a great expense of food—fuel—with only a $\frac{3}{8}$ -inch side, which, tiered up three cases high, would present a surface of more than five square feet of that thin material with four plain joints between the life within and the cold without! Here in this temperate climate where we winter always on summer stands, I find it advantageous to confine the heat, and save it by covering the case with a thick quilt till the nights get warm, though my cases are inside of the second story. Lightness, and ease in handling, may be obtained at too great a sacrifice of other essentials.

To obtain the largest amount of comb honey, we must have at the right time a powerful force of bees. To prevent any "slip between the cup and the lip" by natural swarming before they get to work in boxes, we often do need room below of ten frames, and then to use the extractor. True, 8 frames of solid brood in all stages of development is a strong base; but more room for work and for food is often desirable. Then it is so easy to contract space with the *dummy* when desired. Besides, we have a broader surface on top for storage—a most desirable thing.

J. W. PORTER.

Charlottesville, Va.

THE BEE-KEEPER AT HOME.

SEE PICTURE ON PAGE 739, DEC. 1.

I RECEIVED GLEANINGS to-day, forwarded from Fremont, and was somewhat surprised to see the trouble and expense you have been to engraving my home and apiary. You are right in your surmises in regard to pine sidewalks in Michigan, Mine has not stones under the stringers, friend R., but it is laid on a hard beaten path; and although it has been down six years, you see it is still straight and level. Yes, I, too, think a picket fence nice, and in our locality we are obliged to have a fence, as cattle run the roads; but even if they did not, I think I should prefer a nice tidy fence of some kind.

I am very sorry the trees in front are not bass-woods, as they were planted one year before I commenced bee-keeping; but along the north fence is a row that I have planted since; and I am proud to say, that when I bought the ground, seven years ago, there was no fence, sidewalk, trees, or house; and I have made the improvements (aside from what God has done) with my own hands, and I feel like saying to all bee-keepers, "Go thou and do likewise." The latch-string is always out; and if you or any other bee-keeper should happen along at any meal-time, I will guarantee that the meal will be palatable. The baby is a girl, and her name is Lulu. I wish you could see her, and know her father. You could not borrow the baby, but you could hold her a while, and I know she would have a smile for you, as she does for every one; and she, with her papa and mamma, have done much to cheer me in my sadness.

Oh, but we did miss you so much at the convention at Flint! We had a delightful time, so many

topics of interest were discussed, and the dear old father Langstroth made the place seem almost sacred; and how kind in friend Jones to get those nice photos for us all, and so cheap! and friend Cook, Hutchinson, and others did much to make the meeting the success it was.

GEO. E. HILTON.

Montgomery, Hillsdale Co., Mich., Dec. 8, 1883.

SOMETHING NEW IN THE WAY OF COMB HONEY.

ALSO SOMETHING NEW TO TAKE TO OUR COUNTY FAIR.

I PRESUME most of our readers have been astonished at the ingenuity which has been displayed in the past year or two in making bees build honey just where their owner wanted them to build it. Not only are stars and hearts and crosses and circles exhibited in beautiful white comb honey, but something has already been done in the way of letters and figures. And now comes Geo. W. Lawson, of Centreville, Montgomery Co., O., with an order as follows:

I want eleven sections made, similar to your fancy sections, only representing a letter instead of stars. The eleven letters and figures are

OUR FAIR, 1884.

Each section is to have one of those letters or figures cut out as you think best. Of course, they are to be sent with the other goods, and you to make your charge, whatever is right, and let me know.

GEO. W. LAWSON.

Centreville, Ohio, Dec. 13, 1883.

After reading over the above part of the letter I was just about to tell our friend it could not be done; but Mr. Gray, who sat by, made the remark, "Why, yes, we can do it. You let me have that part of the order." It was given him, and in a day or two he called me to come and look at his fancy sections. Sure enough, he had got it; but in order to make a sure thing of it he had made the sections large enough so that only two would go into an L. frame. To make them, he first made light square frames of about such stuff as we make our wide frames out of. Two of these just slipped into one wide frame. Now to make the letters, corner-pieces and various-shaped little blocks were bradded into these frames so as to leave just the space to make a letter. These blocks and corner-pieces were made of $\frac{1}{4}$ -stuff. First one side was finished, then a sheet of fdn. laid on, and the other half put on.

As many of our friends will want to know what these big sections filled with fdn. ready for the bees will cost, I will state that we can make them for 25 cts. each letter or figure, and you can have any letter or figure you choose. I would not advise them much smaller than the size we have given, in order to get them so the bees will work in them readily. Those we have made give a

space of about 3 inches in width for the heavy part of the letter.

A LETTER FROM CHINA.

AND SOMETHING ABOUT TOBACCO, AS WELL AS CHINESE BEE-KEEPING.

FRIEND ROOT:—I have enjoyed the visits of your journal for several years. True, I can do nothing at bee-raising. We (myself, wife, and daughter) spend our winter months in the interior of this province at a place called Shao-wu, where we have a station, and a small but growing church. The spring and autumn we spend here at Foochow, while two of the hottest months are spent at the seaside. Under such circumstances we could not have bees or any thing else that needs looking after regularly. But I sometimes find it a pleasant recreation to read over the various experiences of bee-raisers. It is all entirely different from the things that must usually occupy my mind.

I see but rarely any bees in my travels; and from what little I have seen, I suspect that Chinese bee culture is of the rudest kind. There is generally a little honey in the comb to be had in the autumn. The combs are old and new, good and bad, all together. If we get the first pick at it, when the man comes around peddling it, we can select out some pretty fair pieces. I send herewith a sketch of a Chinese bee-hive. It is, so far as I know, a rude box with a rounded top, suspended by ropes against the side of the house under the eaves, which in this country generally project two and one-half to three or even four feet. The one peculiarity about all that I have seen is, that instead of one long narrow slit at the bottom of the hive, there is a number of round holes about half an inch wide in the front face of hive. The other day I saw an apiary of four stands, where the hives were simply tea-chests. Each one had thirty or forty of these holes distributed pretty evenly over the whole front side of the hive, from top to bottom.

TOBACCO AND OPIUM.

But if the Chinese lack honey, they have no lack of tobacco. Everybody smokes. If the Chinese would only take to Christianity as they have taken to tobacco, the nation would quickly evangelize itself. But opium, not Christianity, follows tobacco. First they became a nation of tea-drinkers, a small thing, seemingly; but it prepared the way for tobacco, and this in turn has prepared the way for opium. God grant that it may not be the same in America; but if the tobacco does not go, the opium will come.

The Chinese method of smoking is peculiar. Instead of filling a good-sized pipe, and puffing away for several minutes, a pinch of tobacco is put into the bowl of a small pipe, and lighted, and one or two full inhalations taken. Then this is knocked out, and another pinch put in, and so on, very leisurely, until the smoker is satisfied. Of course, this requires some kind of tinder that will burn or smoulder a long time. The thing most commonly used is a tight roll of coarse paper, about the size of a slate-pencil. The paper is made of bamboo, and the charred end of the roller stick will catch fire from a spark, like punk. A sharp, quick puff of breath will make it blaze. A substitute for this paper, roll, or stick, in the country, is the stalk of the hemp. After the bark has been stripped off, the stalks are immersed in a ditch or stream for about three weeks, and then

bleached in the sun. The result is a stick that has much the nature of punk. Here is something, now, that may be of value to bee-raisers when their supply of punk gives out. I presume there are other vegetable stalks besides hemp that would yield the same result under like treatment.

I once saw some Chinamen attempting to make a swarm of bees settle, and they made a big racket with gongs, etc., just as we used to do in America. In fact, the Chinese have such faith in a loud racket for remedying all manner of troubles that they may have originated the practice. They attribute all manner of misfortunes to evil spirits, and make outlandish noises to frighten them away.

I once asked a Chinese scholar what was the difference between the teachings of Christ and Confucius. He seemed to wonder a little at the question, and replied: "Why, Confucius teaches how to be an officer, or person of rank. Christ teaches us how to be men." This answer indicates pretty well the difference between Christ and all other founders of religious systems. They all know of no other way of overcoming the evil of the human heart, except by processes of study, meditation, and asceticism, utterly beyond the reach of ordinary human beings. Christ throws aside all such legal devices as powerless to save any one, and proffers to all the atonement of his death, and the renewing of the Holy Spirit, on condition of a simple, childlike faith that is within the capacity of every rational human being.

J. E. WALKER.

Foochow, China, Oct. 19, 1883.

Many thanks for your kind letter, friend W. I should think by the drawing you send, that the Chinese have made some progress in bee-hives, in advance of the surrounding nations. A tea-chest of convenient size might be arranged without much trouble, so as to make a pretty fair chaff hive, and it seems to me it would be quite a little advance over the rude clay cylinders. The idea of suspending them under the eaves, however, seems to me is not only novel, but it would be decidedly inconvenient in handling bees as we handle them. It is a sad, sad thing, friend W., to see what a fearful amount of ruin comes from tobacco and opium. Why can not the people of our own country, as well as China, be taught that true happiness never comes in the way of gratifying tastes and passions with things like these? It is only Jesus, and he alone, that can take away the sin of the world.

REVERSIBLE FRAMES.

THEIR ADVANTAGES; AND SOME OTHER MATTERS EQUALLY IMPORTANT.

FRIEND ROOT.—For the past year I have, from time to time, given a deal of thought to the subject of reversible frames; namely, their advantages, and especially the best possible plan or device for reversing them. The advantages of reversible frames are many, but I will not now enumerate them all. Suffice it to say, that for securing large yields of comb honey it is very desirable to have the boxes very close to the brood, bees being oftentimes very unwilling to pass over an inch or more of sealed honey in order to reach the surplus-chamber. This unwillingness, as indicated, especially applies to pure Italians. This fact led me,

many years ago, to uncap the cells of honey in such a way as to force the bees to remove the honey therefrom, in order that they might repair the damage thereto. As a rule, if the bees, at the time of uncapping, are working in the boxes, and have plenty of empty comb therein, they will transfer more or less of the honey thus uncapned to the surplus-honey receptacles, and the queen will then occupy the vacated cells with eggs. This plan will secure brood, generally, close up to the top piece of the brood-frame. After a time I found that the very best device for destroying the caps of the cells of honey is a table-fork—say with 3 or 4 tines. With this I simply *scratch* the caps, which is quickly done, and this mutilates them, as well as the top walls of the cells, and to such an extent that the bees *must* take out the honey before they can repair the damage done. Uncapping, or scarifying, the sealed honey, for the purpose given, was an idea that originated with me, and was new to friend Langstroth at the time I first called his attention thereto. If you will examine Prof. Cook's new work, *Manual of the Apary*, page 189, you will there find that he refers incidentally to this important discovery in the practical management of bees, though he does not seem to catch the full import of its value.

The idea of using a table-fork so as to mutilate the comb, more than by simply shaving off the caps of the cells with a knife, was also original with me, and the idea or plan has never, to my knowledge, been referred to in any shape, in any publication up to this date.

There are *hints* enough given now, in the foregoing, to enable any one to induce bees, whether black or yellow, to carry all the honey from the brood-chamber to the top story. Two or three manipulations, at the proper time, will *force* the honey up stairs.

And now I return to the idea of *reversing* the brood-frames for securing the same result, and to save the labor of scarifying the cells of honey. The reversing puts the sealed honey, in case there be any, at the bottom of the hive, and in such an *unnatural* position that the bees will uncap it themselves, and carry it above the brood; and the brood being now close up to the top of the frame, the bees are again *forced* to take it up stairs to the surplus-honey chamber.

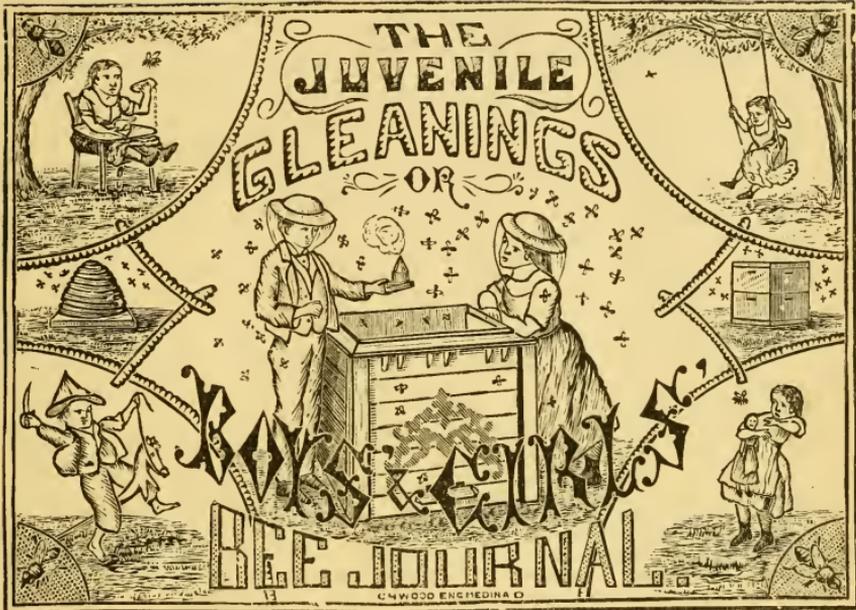

Let me refer to one more advantage to be secured in reversing the frames, and I will then close. I refer now to the fact, that if the frames be reversed during the drawing-out of fdn., that the comb and work at the bottom (now top) of the frame will be as perfect as it always is at the top of a frame not reversible. In other words, the frame will be full from top to bottom of a complete and solid comb, which, when built on fdn. in wired frames (and no other should be used), will stand shipping by rail or otherwise, *any distance*, and will also keep its proper place while extracting, or during any other necessary manipulation.

So much space has now been used up in discussing some of the *advantages* of reversible frames, that I will reserve what I may have to say upon the best possible plan or device for reversing them, for some future occasion.

M. M. BALDRIDGE.

St. Charles, Ill., Jan., 1884.

Very good, friend B. And now, then, for the best reversing device. Quite a number of very ingenious ones are already submitted for my approval.

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

MYSELF AND MY NEIGHBORS.

It is more blessed to give than to receive.—ACTS 20: 35.

WOULD it not be funny, little friends, if we did not have any neighbors? So far as I remember, the only person of whom we have any record, who lived very long without neighbors, was Robinson Crusoe—or really Alexander Selkirk. I suppose you know that the book called Robinson Crusoe is, a great part of it, fiction, although it is founded on fact. This Mr. Selkirk did live on the island of Juan Fernandez some three or four years, and he had no neighbors, unless we should call his cat and dog and parrot, and such animals as he domesticated, neighbors. As to whether he really had a man Friday or not, I am unable to say; but very likely he made friends with some of the natives as soon as they happened to touch the shores of his island. Poor Robinson Crusoe! for such I suppose we shall have to call him, how he must have suffered during those years for want of human companionship! Whenever I get into an uncharitable mood, and get to thinking I should like to live for a while without neighbors, it always does me good to think of Robinson Crusoe. I wonder if any of you have ever thought, children, that it would be pleasant to have every thing all to yourselves. You see, if you were on an island you would not have to divide with anybody; you could have all there was to eat, and all there was nice to wear. You could have all

the room without anybody pushing you, or crowding you, or stepping on your toes; and there would not be any need of quarreling, because there would not be anybody to quarrel with. You could not be selfish very well, unless you showed your selfishness toward the domestic animals. In fact, a great part of the wickedness that is now open to us would be cut off. Just think how easy it would be to love God, and do right, if there were no one around to tempt you to do wrong. In fact, what could people do that is wrong, if they had not any neighbors? They could not steal, they could not fight, could not tell lies; and therefore it would be an easy matter to be a pretty good Christian, would it not? It is true, one might grumble and complain. It wouldn't be much use, though, if there were nobody there to hear it. One might be intemperate, if there were any thing on the island to use intemperately, and one might also take God's name in vain, although it makes me sad to think that any one who is alone with God, as it were, should ever do such a thing. I wonder if profane people ever swear when they are alone with themselves.

I have given you this little picture, children, that you may think for a moment what it would be to be obliged to live entirely without neighbors. You may sometimes think it is hard to get along *with* such neighbors as God has given you; but I assure you it would be a thousand times harder to try to live without any neighbors at all. I presume Robinson Crusoe would have joyfully

welcomed the meanest man that ever lived, rather than to be shut up entirely alone by himself. I have sometimes thought that selfishness is the worst sin, or, rather, the foundation of almost all other sins. There are very few sins that do not have their origin in selfishness—that is, our wrong doings come principally from loving ourselves more than we love our neighbors—anxiety to possess every good thing, to the exclusion of other people. How plainly we see it stick out all through the world! Even little children are sometimes greedy—they will quarrel over an apple, a bit of pie, or a cake, when there is an abundance of all of them; and people of an older growth often do just as foolishly. They are backward about sharing with their neighbors, and reluctantly divide, or consider the good of others, when at the same time they would never be happy at all if they had not somebody near them to divide with. Jesus said, "It is more blessed to give than to receive;" and in this little text there is a wonderfully great and beautiful truth. He did not mean, of course, that we should give away every thing we had earned by hard labor, without an equivalent, but he did mean we should look out about being greedy and unfair, and that we should remember that unhappiness always comes from giving way to feelings of selfishness. I asked my wife the other day how soon babies begin to act selfishly. She thought they were not selfish at all, naturally.

"Well," said I, "how soon do they commence being generous and liberal? Huber is now about seven months old, and he has learned to smack his lips over a good many delicacies, and to show in other ways that he keenly enjoys them. Now, has he ever shown any disposition to divide or share with others the good things he enjoys?"

Of course, we all became interested in the matter, and tried to see if we could make him exhibit any traits of a disposition in his little mind to love his neighbor as himself. I succeeded a little with one experiment, and I hope the little friends will not laugh if I do tell of such a trifle. Huber has a lot of playthings, as you know, and, like other babies, he gets tired of them, and wants something new. When he first gets up in the morning he will take his basket of toys, and amuse himself quite a while with them, but eventually he gets wearied of the things he has seen from day to day and from week to week, and, like the rest of us, wants something different. By the way, I want to tell you that the toy that seems to hold its attraction the longest is one of his little shoes that he has outgrown. He will chew this, and wet it all over with his little drooling lips, more than almost any thing else. Now to my experiment. One day I gave him my large nickel-plated door-key, and he was much delighted with it. Of course, he pushed the bow of it into his little juicy mouth, the first thing. Then I put out my hand for it and said, "Papa have it?" He at once pulled it out of his mouth with the bow of the key webbed over with a sort of soap-bubble (you know how it would look), and instantly pushed it into my mouth. My experiment succeeded, and we had a big laugh.

He evidently derived great satisfaction by putting the pretty plaything into his own mouth, and, in the generosity of his little heart, he acted upon the impulse of the happy thought to let his papa enjoy it in the same way too.

Now, children, just a word in regard to selfishness. I am inclined to think it is a fact, that babies and children of all ages are much more liable to take naturally to selfishness and other sins, than they are to be generous and fair and kind. What do you suppose a baby would be, brought up on an island, like Robinson Crusoe—that is, suppose the thing were possible? Poor little Huber could hardly live a few brief hours without neighbors, or his own natural protectors, if you choose, to care for him, and watch that he didn't tip over and bump his little head, and such like accidents. When he gets to be several years old he might possibly live on an island; but what sort of a boy would he be? We are dependent upon friends and human help, not only for the food that we eat, but for the Bread that cometh down from heaven as well, and I do not know how we should ever know God, or love him, or even know the sinfulness of selfishness, were it not for the kind friends God has so wisely placed here to guard us from going into the broad road that leads to destruction. Do we not, indeed, owe a great debt to our neighbors, and to God for having given us neighbors, even such as they are?

THE DISCOVERY OF SILK.

COMPILED AND WRITTEN BY MISS NELLIE LINCOLN ROSSITER.

Continued.

SUBSEQUENTLY, silk became an article of exportation. From China, it went into all the other countries of Asia, and afterward to Europe. The traders of Serica journeyed, at first, with the silken stuffs over the whole breadth of Asia. Two hundred and forty three days were usually spent by the caravans in going from the coasts of China to those of Syria. The prices they obtained far exceeded the expenses incurred; and thus the silken stuffs were found in every mart; but principally in Nisibis, in Mesopotamia, and among the most active traders in the world, at that epoch, the Phœnicians, who at length carried them to the east of Europe.

The Greeks derived their first knowledge of silk from the military expeditions of Alexander, into Persia and India; and Aristotle called to it the attention of his countrymen as early as 350 years before Christ. I have already related by what means the Romans obtained their silks. At first, on account of the high price of the silk, these stuffs had but the chains of silk, and the filling either of linen or cotton, or vice-versa, and may, therefore, be called half-silk stuffs. Roman writers gave them distinct names. But a general outcry soon arose, even against the half-silk stuffs, under the pretense that they were too expensive and too womanish. Under the Emperor Tiberius, 17 years after Christ, Haterius and Fronto declared themselves strongly on the subject; and it was ordered, that "no silk dress should henceforth degrade a Roman citizen." Even under Mar-

cus Aurelius, in the year 173, such attire was worn only by ladies of the highest rank. The Syrian voluptuary, Heliogabalus, was the first who wore a dress wholly composed of silk, in the year 218; but in 270, Aurelianus denied to his wife Severa such a dress colored with purple. "Let us not," said he, "exchange gold for spiders' web;" and, indeed, at that epoch silk was of the same value with gold, weight for weight.

The silk-trade increased, nevertheless, more and more in India, Persia, and Arabia; principally from the progress of luxury in eastern Europe, and the consequently greater demand for silk fabrics. No law could counteract such a propensity; and it was accordingly disregarded entirely in the eastern empire, under the reign of Justinian I., from 527 to 565. Through the intercession of the ill-advised Empress Theodora, the wife of that Emperor, a monopoly of the silk-trade was granted to a broker by the name of Peter Bersames, who became afterward chief of the imperial body-guard. At this time, not only silk stuffs but raw silk was imported from China, through Persia, and chiefly by way of Samarcanda and Bokhara, into the Phœnician cities of Tyre and Berytus, where silk was manufactured, and from whence it was afterward conveyed into foreign countries. The monopoly granted to Bersames tended, however, to diminish greatly in those cities the profits of the silk manufacturers and traders. The greater number of the former emigrated into Persia, and there opened work shops.

WHY BEES LEAVE THEIR HIVES IN WINTER.

ANSWERED BY A JUVENILE.

MY uncle has had bees two summers, but last summer they swarmed so much he did not get much honey. The first swarm made 50 lbs. of surplus of comb honey, and made enough to winter on. Last winter so many bees flew out of the hive during cold weather, my uncle could not think what was the cause; so he searched in the A B C book, but that didn't tell him, so he had to find out by experience. At last he found out that they were too warmly packed in chaff; so he gave them more upward ventilation. I think you ought to mention this in your A B C book. It may save many a bee, and much hard study. After that they stayed very quiet. I attend school, and in summer I attend Sabbath-school. My uncle, A. H. Baum, is superintendent of the school. If this is worth a book, please send me Rescued from Egypt.

Ashland, Ohio, Dec. 24, 1883.

CORA BAUM, age 14.

To be sure, your article is worth a book, Cora; in fact, it touches upon a point that has been almost overlooked; and while I am not prepared just now to say you are right, the idea certainly seems quite probable. We have had abundant proof that bees often die because the hives were made too close, and do not allow sufficient air. Now, when they begin to feel they are suffering from want of air, it would be nothing strange if they should leave the cluster and crawl out or fly out, even when the weather is such as to make it certain death for them to do so. We know that sick bees often take themselves out of the way to die alone, where they may not communicate the disease to the rest of

the colony. If sickness, induced by want of air, should lead them to do this, we are right in your line of thought exactly—or, perhaps, your uncle's line of thought. You know I have told you during this past fall to leave the entrances to chaff hives open the full width in winter. I am pretty well satisfied, also, that the packing over the bees must not be too solid. It needs to be loose, like chaff in a very open and porous sack, like burlap or very coarse bagging; and besides this, there must be ventilating-holes of pretty good size in the cover—I should say, at least a hole on opposite sides, $1\frac{1}{2}$ inches in diameter. This hole, of course, would better be covered with coarse wire cloth. It should be in such a place that it can not be stopped up by snow or ice. Forest-leaves have been suggested in place of chaff, because they are still more porous, and may be we shall have to use some such thing in place of chaff, especially where we have long protracted cold spells. It seems a little queer, does it not, friend Cora, that the bees need more openings during severe cold weather than they do when it is only a little cold, and cold for only a little while?

HOW THEY MANAGE BEES ON MOUNT HYMETTUS.

A COMMUNICATION TAKEN BY ONE OF OUR JUVENILES FROM A BOOK PUBLISHED IN 1838.

WE have 34 hives of bees. We have a book in which there is an article on bees. It was printed in 1838, in England—"Management of Bees on Mount Hymettus, in Greece, by G. Weeler, Esq." The hives in which they keep their bees are made of willow or osiers, fastened like our common dust-baskets, wide at the top and narrow at the bottom, or plastered with clay or loam within and without. They are set the wide end upward, the tops being covered with board; flat sticks are also covered with clay at top, and to secure them from the weather they cover them with a tuft of straw as we do.

Along each of these sticks the bees fasten their combs, so that a comb may be taken out whole without the least bruising, and with the greatest ease imaginable. To increase them in spring time—that is, in March or April, until the beginning of May, they divide them, just separating the sticks on which the combs and bees are fastened from one another, with a knife, so taking them into another basket in the same order that they were taken out until they have equally divided them. After this, when they are both again accommodated with sticks and plaster, they set in the new basket in the place of the odd one, and the odd one in a new place, and all this they do in the middle of the day, at such a time as the greatest part of the bees are abroad, who, at their coming home, without much difficulty divide themselves equally. This device hinders them from swarming and flying away.

In August they take out their honey, which they do in the daytime also, while they are abroad, the bees being thereby, they say, disturbed least, at which time they take out the comb laden with honey as before; that is, beginning at each outside, and so taking away until they have lifted out such a quantity of comb in the middle as they judge will be suffi-

cient to maintain the bees in winter, sweeping those bees that are on the combs they take out, into a basket again, and again covering it with new sticks and plaster. It has been doubted whether in England the like quantity of honey may be taken without endangering a scarcity in winter, the bees probably not collecting so much; let less, therefore, be taken away. By these means, it has been said, the great increase and multiplying of the stock would soon equal, and far exceed the little profit we make by destroying them.

ROSEY E. SMITH.

New Hamburg, Ont., Can., Jan. 1, 1884.

My little friend Rosey, you have given us quite an important communication. I have several times looked musingly at our stout willow baskets, and wondered why a beehive could not be made of them that would be strong and serviceable, and yet, perhaps, winter bees better than any wooden hive ever made. A common basket, wide at the top and small at the bottom, might do pretty well. Of course, the combs would not be readily interchangeable, because those at the outside would be small, and those in the center large. We have figured such hives before, and discussed them in our pages. A straw cap would make it equivalent to a straw hive. Our readers should bear in mind that this kind of movable combs was made and used before Mr. Langstroth began with his; and although they are rude, with them one might, after a fashion, perform almost all the operations of modern bee culture.

A ROUSING REPORT FROM ONE OF THE JUVENILES.

WHAT 30 SUGAR-FED COLONIES DID IN 1883.

MA has 66 colonies of bees. We extracted 7500 lbs. of honey. I mean to be a bee-keeper. I should like to spend a year with you, to learn the best way to work bees, when I get my schooling done, if we all live. We had only 30 colonies last spring. We winter our bees on granulated-sugar syrup. We take GLEANINGS. Ma would not like to be without it. She saw you at Toronto.

JOHN W. STENNETT, age 10.

St. Mary's, Ont., Dec. 28, 1883.

Why, friend John, your report is a most wonderful one indeed. Over 200 lbs. to the colony, spring count, and that from an apiary of over 30 hives! When I looked at your figures I instinctively turned to the bottom of the letter, to see where it was that they had such wonderful success. When I saw it was in Canada, I did not wonder so much. It gives me a real thrill of pleasure to hear of such magnificent results, coming first from one quarter and then from another. It seems to me to indicate that God wishes to tell us that he does not want to be partial, but that great results may be expected in almost any locality, if you are bright and enterprising, and ready to take blessings when they come. May be the sugar-syrup feed had nothing to do with it; but I am inclined to think those 30 colonies must have been remarkably strong and healthy.

JUVENILES FOR DOING HOUSEWORK.

ALSO SOMETHING ABOUT A BEAUTIFUL LAKE AWAY UP ON TOP OF THE MOUNTAINS.

DEAR CHILDREN, have you noticed that, in nearly all reports from the juveniles, it is only in letters from California and Texas that boys say they help mamma wash dishes, and cook? Well, if you notice you will find it as I have said. Now, the reason is, that we here in California (and I suppose it is the same in Texas) can not get help, so we have our boys help us; and since I have been here I have often wanted to urge eastern mothers to teach their boys to do housework. Fifteen years ago, except in large cities, there were hardly any women and children here, and you would feel sorry if you had seen the way the men lived. You see, almost none of them had ever had to do a mite of housework, so of course they did not know how to do it, and most of them never really did know how; for with their outdoor work and poorly done housework they had no time to learn.

Some boys might say, "I won't learn, for I am never going where I shall have to do it." Don't be too sure. Learn; and even if you don't go into new countries you will find it very handy when mamma or wife is sick or "so tired." And then, again, that is the way to learn to be neat and handy, if you are in any kind of business, especially the bee business. My! how I have laughed to see some folks take care of honey! It would be all over the floor and hives, and the person's clothes, till it would take longer to clean up than it did to do the work. Now, if such a person had been taught to do housework when he was a boy, he would not have made so much unnecessary work.

In my last letter I told you about the hot spring of Las Cruces. Now I will tell you of a lake 3000 feet above the sea. Our little village is about 1000 feet, so that is 2000 feet above us. At the upper end of this valley, seemingly right across the end, but 10 miles away, is a long ridge of mountains, and near the top of one of the peaks this lake—Zica Lake it is called—is located. It covers about 100 acres, and is so clear that one can see away down to the bottom 15, 20, and in some places 30 feet deep. There is no knowing what keeps the lake going, away up that tall mountain; but quite a good-sized creek runs from it. Many people go to see it and bathe in its cool clear depths. When we go we have to take horses that will let us ride upon their backs; for when we get to the mountain we unhitch and unharness the horses, put on the saddles (if we were thoughtful enough to bring them), and ride up three-fourths of a mile. But every one is charmed and thinks that the trouble to get there is fully compensated by the beautiful sight of lake and pines that surround it.

MRS. K. HILTON.

Los Alamos, Cal., Nov. 24, 1883.

Mrs. H., I am glad you have taken up this subject of teaching boys to be neat and handy about the house. I do think it is really a fact, that a man or boy can hardly expect to succeed in bee culture until he learns neatness and order. One great reason why I employ girls and women in our office is because that, with the many different things we have to handle, it would be impossible to get along with anybody as slovenly as many boys and men are. Occasionally we have a little experience with some

young men who have never been taught neatness and order; and although they do not seem to know it, I have sometimes thought them to be almost as badly off as if they were crippled in the hands or legs or both. It has sometimes seemed to me as though the great crying thing in the present generation was for neatness, system, cleanliness, and order. In many kinds of business, disorder is utter ruin. In fact, just now while scores are begging for something to do, I am in urgent need, in many places, of somebody who knows how to work, without doing more harm than good. Disorderly and slovenly habits make many good people almost useless for the great business of life. A girl who knows how to cook and keep house will almost always make good help in the office or factory. But boys, by some means, seem to grow up suffering, and perhaps unhappy, through a great part of their lives, because they have never had education of this kind which their sisters almost invariably have.—Thank you, Mrs. H., also, for your vivid description of that wonderful lake.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chief's amang ye, takin' notes;
An' faith, he'll prent it."

WELL, we have a good lot of juvenile letters this month, little friends, and they are good letters too, as I think you will say after reading them. Many of them discuss some of the most important points in bee culture. The letters are all fresh too. I think there is not an old one among them, and I have tried to get all your letters in, so we could have all fresh ones next month. And with this idea in mind I think I will stop right here; for the more I have to say, the less room will there be for your letters—don't you see? But even if I do talk short this time, remember I am Uncle Amos, all the same. Oh! just wait. Only a few minutes ago Huber was over here, and had a real fine time being drawn around the counters in the store, in his little wagon. When he can "go see papa," and "ride in waggie," then he is happy. You see, he

can ride and look at the tinware and all the other things, and have the children chasing all around him besides. Who wouldn't enjoy it?

THE LITTLE BUSY BEE.

Tune—"Tramp, tramp, tramp, the boys are marching."

Oh, the little busy bee
In the garden you may see,
Gathering honey thro' the golden summer hours.
He is cheery and he's gay,
And intent he works away,
Storing treasures from the sweetly blooming flowers.

CHORUS FOR EACH VERSE.

Working, working in the sunbeams,
Gathering honey all the day,
Oh, the little busy bee
Is the type for you and me.
For the winter he provides in sunny May.
When the lark springs from the corn
In the early summer morn,
And ascends on wings of gladness to the sky.
Oh, the little busy bee,
To his labor goeth he;
You may hear his merry song as he goes by.
In the sultry glare of noon,
Still he sings his merry tune
As he ranges through the depth of some bright hell;

If you try to shut him in,
You will hear a pretty din,
And may chance to get an angry blow as well.

When the slowly sinking sun
Tells that day is nearly done,
Then the little bee, no more inclined to roam
With his laden bag and thighs,
Like an earnest worker hies

To the lowly straw-built cot where is his home,
Caro, Mich.

—W. E. BUMP.

THE BEES.

The bees, the bees, they work away,
I believe they work by night and day.
As to their hives they flying come,
With golden honey on their tongue.

The bees are wise, 'tis very true.

And even wiser than I or you:
As on the clover they do hum,
It seems as if 'twere only fun.

They work on clover white and red.
They carry wax upon their leg;
And as they fly upon their wing,
If you hurt them they will sting.

And I have very often thought
How God has them so wisely taught
To build their combs so very neat,
And within the honey is so sweet.

Middleton, Pa.

HARRISON S. BRINSER.

FROM 7 TO 22, AND 600 LBS. OF COMB HONEY.

My pa had 7 stands of bees in the spring. He now has 22, and has taken 500 lbs. of comb honey in one-pound sections.

Bates, Ill., Dec. 1, 1883.

BESSIE MORRISON.

A SMALL LETTER FROM A SMALL BOY.

I am a little boy 8 years old. My pa has six swarms of bees, three cows, and one calf, and one horse. I would like Silver Keys.

Kingsville, Ohio, Dec., 1883.

WILLIE PEASE.

A PRINTED LETTER FROM ONE OF THE 6-YEAR-OLD BEE-FRIENDS.

Pa said he would help me write a letter, so I could get a book. Pa takes GLEANINGS; he has 35 swarms, and I have one. I like white clover honey best, as it does not taste as strong as some. Pa has extracted once from my swarm. I will now close. From your little friend,—

South Lyon, Mich.

CLAUDIE SMITH, age 6.

BLOSSOM, TOM, SEYMORE, AND PETER.

We have no bees. I have a little brother and a little sister. I have a cow named Blossom, and a kitten named Tom. We have two horses, named Seymore and Peter respectively.

MISSOURI C. SHIELDS, age 9.

Pond, St. Louis Co., Mo., Dec. 2, 1883.

THE SWARM OF BEES THAT EDGAR FOUND ON A HILL OF CORN.

I have one colony of bees, and pa has nine. I found mine on a hill of corn, when I was carrying water to my uncle. I had only a box-hive to put them in, but pa gave me a Simplicity, and I am going to transfer them in the spring. EDGAR YOCOM, age 9.

Williamsville, Sangamon Co., Ill., Dec. 27, 1883.

I suppose, Edgar, you mean you are going to transfer them in the spring if they live. But for that matter, you might transfer the combs, even if they do not live, and then you will have so much toward a colony in the spring, and a hive full of combs is certainly half of it.

HELEN'S REPORT.

Pa has 9 colonies of bees, all in box hives; he is going to transfer them in the spring. He sent for 50 Simplicity hives and 100 metal-cornered frames. He has about 20 frames made. He could not get them together very well. He does not like them as well as all-wood frames. Pa and Uncle John tore a box hive to pieces last summer. After they smoked the bees into another hive, they cut all the honey out of the hive and ma strained the honey. I like to work with the bees. I am going to send my letter with brother Edgar's. If you think this is worth a book, please send Silver Keys.

HELEN YOCOM, age 11.

Williamsville, Sangamon Co., Ill., Dec. 27, 1883.

LUCY, AND HER GRANDMA AND THE BEES.

Grandpa keeps bees; he has 13 colonies in box hives. He talks of transferring them to the Langstroth hive, as he has become interested by reading GLEANINGS. Grandpa feeds his bees sugar, and most of the honey. Grandma watches the bees, so when they swarm we can get them. Grandpa says he can go out into the cow-yard, yell as loud as he pleases, and she can't hear; but let the bees swarm, and she is the first to hear them.

Kizer's, Pa., Dec., 1883. LUCY ANN HOUSE.

Lucy, there is a text in the Bible which says, "Where your treasure is, there will your heart be also;" and almost anybody can hear better about something in which he is deeply interested. I presume that is why your grandmother hears better about the bees; she is thinking about them, and her mind is on them.

250 GALLONS OF ORANGE-BLOSSOM HONEY.

It is now December. I do not suppose you hear the merry sound of the little bees as we do. They are as busy now on the wing as in the month of May, but not as profitable, as they fly from hive to hive trying to force an entrance; and if they find a weak colony, they go in and take the honey. We have flowers in the yard, and a few wild ones; but it seems that they have not got the fragrance, or honey, as in the summer. Our orange-trees are full of bright oranges, and in about two months they will be white with bloom; then the little bees will fly for profit, for the blossoms afford a great deal of

honey, as well as pollen. We extracted 250 gallons of orange honey this year. Will you allow a little boy the same chance as you do the girls—that is, a bunch of envelopes? If you think that this letter is worth a bunch, please send me one.

ELBERT A. FROSCHE, age 10.

LaGrange, Fla., Dec. 7, 1883.

Why, Elbert, it would be funny if we did not allow a boy the same chance we do a girl. People generally get it the other way.—Now about that orange-blossom honey. That is the biggest lot I ever heard of; and if it is as good as the oranges your father sent us it must be beautiful. Will you ask him to send us a sample in the little block we send him by mail? If it is nice, we want a barrel of it, sure—that is, if your pa can furnish it. And if the bees are working on orange-blossoms now, tell him to manage to save us some as near pure orange-blossom honey as he can.

THE POOR BEES THAT HAD NOT A DROP OF HONEY.

My papa has 54 colonies of bees, and I have one. He got 350 lbs. of comb honey, and 1000 of extracted. Pa went to a neighbor's this fall to help him introduce a queen that he had got from you. He noticed that the bees of one of the hives were acting oddly; he told Mr. K. that he believed those bees were hungry. They opened the hive, and, sure enough, there was not a cell of honey, and I was sorry when I heard him say, "Just let them go." I would have fed them. I will tell you next time how I got my swarm of bees. This is the third letter I have written, but mamma burned the other two. She thought they were not fit to send.

CHARLES A. SEADRIGHT, age 7.

Blaine, O., Dec. 3, 1883.

Charley, I am real glad indeed to hear you say you would have fed those bees; and I am sure almost any of our juveniles would have done so, even if they had had to buy the sugar for doing so. I am very sorry your mamma thought best to burn up your two first letters. You just tell her that Uncle Amos can read children's letters a good deal easier than she thinks for. Tell her I don't mind, even if the letters are crooked. I love these little letters just on account of their crookedness, and the juvenile twist that the letters seem to take.

LETTER FROM A 6-YEAR-OLD.

Mamma says I may print you a letter. I can not write well enough yet. I go to school, both day and Sunday school. I should like to see your baby, and help rock it to sleep. I have a hive of bees, some chickens, and 2 ducks. Papa says you call your baby Huber. It is a very nice name.

MINNIE MYRTLE WRIGHT, age 6.

Millerstown, Perry Co., Pa., December 24, 1883.

Your letter is very nicely printed, Minnie, and you have got in the punctuation pretty well, and have put in the capital letters where they belong. I guess your mamma advised you a little, did she not?

FLORA AND THE BEES, AND HER HORSE.

My pa has 17 hives of bees; 5 of them are Italians, the remainder are blacks. I have a share in the bees for helping to attend to them. We keep our bees in the cellar when it is very cold. We all like to work with them, and take care of them. I live in the

country, on a farm. My papa farms, and runs a steam sawmill. We all like GLEANINGS. My little sister and I claim the JUVENILE. I go to school every day, and help do the evening and morning work. I have a young horse; he is so kind and gentle that I can drive and ride him any place. Don't you think girls ought to learn to manage horses too?

FLORA J. WRIGHT, age 12.

Millerstown, Perry Co., Pa., December 24, 1883.

Yes, Flora, I do think that girls ought to learn to handle horses. And for that matter, they ought to learn to do every thing useful, so that in case of emergency they may be found useful as well as ornamental. Do you not agree with me?

CLARA AND HER PAPA AND THE BEES.

My father has 18 stands of bees. This summer, when the bees swarmed, my eldest sister and I had to watch them, and when they swarmed we would have to run to the shop. Papa is a tailor, and is the only one in this town. He is very busy most of the time. The bees take a great deal of papa's time, but he does not care. He gave me a stand this summer, and says I will have to tend them. One time a swarm came out, and we were cleaning house, and they did not settle for a while, and we did not know what to do, because papa was not at the shop; but pretty soon they settled, and then we were glad; but when I went out again to see them, they were all going back into the hive, and papa said it was because the queen did not come out with them. Do you think that was the reason? Our bees here in Iowa mostly make the honey of white and red clover. The boys take their hats and catch and kill them; I think they are wicked. One time papa talked to a boy for killing one, and told him how bad it was, and then he was sorry. CLARA MADSON, age 12.

West Branch, Cedar Co., Iowa, Dec. 14, 1883.

I think your pa is right, Clara. They went back because they did not discover the queen among them. Bees could not very well go to housekeeping without a queen. That would look like a home without a mother.

ARTHUR'S REPORT.

My pa put 63 swarms of bees in the cellar the 15th of November; commenced in the spring with 47 swarms; ran 10 hives for extracting; did not allow them to swarm, and got 1600 lbs. from them, and sold it here at home for 10 and 12 cents. My pa shoes horses this winter, but I think I would rather learn to handle bees, as I like honey very much. I read the JUVENILE. I like to read about little Peter, and I should like to see him and hug him. I think Peter is a good name, for Peter was a good man.

ARTHUR HULET, age 11.

Villenova, Chau. Co., N. Y., Dec., 1883.

But, Arthur, your pa could not work with bees in winter very well, were he not a blacksmith. I think it is a pretty good plan to learn to shoe horses, or do something useful, while the bees are buried up in the snow, or put away in the cellar; because if one depends entirely on bees, you know they may have a season or two when they would not get much surplus. After one has got established in business, and has got a little laid away for a rainy day, he might, with his 60 colonies, devote his whole time to it profitably, winter and summer—that is, providing he made his own hives and honey-boxes,

or something of that sort.—Many thanks for your kind words to little Peter; but his mother says we must all call him Huber now. I should be very glad to let you give him a good hug, if you were here; but he has got so large now that it takes a pretty smart boy of eleven years to handle him easily.

A LETTER FROM CALIFORNIA.

Father went out to see the bees this evening. He rapped at the door of one hive to see if they were at home; he received no answer, and finally he opened the door and peeped in, when, lo and behold! not a single live bee was to be seen. The brood-apartment was filled with comb, but no honey or bees were to be found. Well, they had been overpowered and robbed, and then turned over and helped to carry away their stores of surplus honey. We rapped on all the other hives, and they leaped out and told us they were at home. We stopped up the entrances, leaving $\frac{1}{2}$ or 2 inches open, and will watch them sharply. We have fine warm weather all the time, so the bees are flying briskly nearly every day. We have sold about \$225.00 worth of honey from 10 swarms of bees. I don't know whether we have the right to be called apiarists or not, because we have never yet been able to find a queen, although I have looked and hunted, and hunted and looked for them. Accept our thanks for the fine collection of beautiful labels which you sent us. We have no Italian bees.

Two years ago we got some spider-plant seed of you. Not one single solitary seed ever came up, so I have no experience with it. I think the cause was because they arrived too late in the spring, as the dry weather came on immediately after. Our warm spring weather comes on from four to seven weeks earlier than yours. Phacelia is our great honey-producing plant. It blossoms from April to September, and our bees work on it like little demons all the time. You lay great stress on your honey candying during cold weather. We are not troubled that way, for we never have any cold freezing weather at all—nothing worse than a heavy frost. I suppose you keep urging Blue Eyes and Ernest to pile more wood into that stove, to keep their papa from freezing. I do wish you would come here, where warm weather rules eternally.

Ferndale, Cal., Nov. 20, 1883.

C. C. DRAKE.

Now, my friend, you are mistaken about piling in the wood. We not only warm our factories by steam, but we send this same steam over to the house, about 400 feet away from the factory, and the steam-pipes do the warming there most beautifully. All the engineer has to do is to pile in the coal, and then turn the valves so as to let the obedient steam go just where we want it; and with it we can warm up the room quicker than any stove you ever saw would do it. It seems to me simply wonderful, although we have been using them a good many weeks.—In regard to that spider-plant seed, I am afraid we got hold of some that was not good, and in our great rush of business last year it was sent off without being tested. If all the friends who got spider-plant seed last year that did not grow will write us a postal card telling us so, we will send them a package of better seed free. I suppose the phacelia you mention grows wild in California. We have had it in our garden here to some extent.

HUMPIE AND DUMPIE.

Pa has 8 hives of bees. I had 2 pet chickens. Their names were Humpie and Dumple. One died. I don't know which it was, Dumple or Humpie. I am going to school. I am in the Second Reader.

EMMA CRAM, age 6.

Dividing Ridge, Pendleton Co., Ky.

Well, now, it is a little sad, friend Emma, if you can not tell whether it was Humpie or Dumple that died. I suppose it must have been one or t'other, sure.

A GRAND PLACE TO KEEP BEES.

As I want Ten Nights in a Bar-Room, I thought I would write a letter to you for one. My pa has bought ten acres of land between two big hills, to keep his bees and chickens on. It has 12 acres in it. Three acres are cleared, the rest is in timber. Poplar, linn, dogwood, redbud, locust, sourwood, soft-maple, and hundreds of acres of white clover, catnip, motherwort, milkweed, blackberries, and figwort, growing all around the hills. Pa thinks it a grand place, to keep bees.

Middleport, O. LAURA M. HOBBS, age 10.

I agree with your papa, Laura. Between great hills, where the bleak winds could not well strike the hives, would be one very decided advantage; and those natural caves you speak of, it seems to me would be the very nicest place in the world to winter bees—and very likely to spring them also. Ask your pa if it is not nice to find a cave where the bees will escape frosts, and yet be enabled to fly out whenever the weather is warm enough. I have often thought of such a place, and it has seemed to me that a natural cave would come nearest to it of any thing. I am a little afraid, however, that it might be cold and damp in the summer time. If so, they would probably have to be set outside.

FROM MAINE TO CALIFORNIA; FROM A COUPLE OF WEE JUVENILES.

We came from Maine to Florida one year ago, and like it very well; have had no frost yet. Father has 12 swarms of bees. They gather honey every day. We take it out as we want it to eat. We have just moved into our new house. I have a wheelbarrow, and helped to move lots of the things. We have 20 orange-trees. Mother reads the JUVENILE to me. I would like one of the little books very much. I read every day in my primer. I can read, and spell words of three or four letters. I am learning to print letters. I shall print you one myself soon.

FREDDIE L. GREEN, age 5.

Emporia, Fla., Dec. 10, 1883.

I go with papa when he goes to the bee-house to work. I am not one bit afraid of bees. When I first began to work I used to peek around the corner of the hives, and got my fingers stung a good many times. If you don't want to hear a big noise when Fred's book comes, send me Jack the Giant-Killer.

Emporia, Fla., Dec. 10. SHELLY GREEN, age 3.

Very well done indeed, my little friends. But I presume it was your mamma who wrote the nice letters you send. I do not think your mamma composed it all, especially that concluding sentence from our three-year-old friend. I suppose the idea is, Shelly, that if Freddie had a book, and you did not have one, there would be just about

such a noise as a chick of your age might be expected to make. I am afraid now that our clerks were so careless as not to send two books, so I will have another one sent right off. Uncle Amos never means to show partiality to his little friends.

HOW TO INTRODUCE A QUEEN INTO A BOX HIVE; BY ONE OF THE JUVENILES.

My pa keeps bees, and has nothing but the box hive. For the information of those who are like him, not able to buy the Simplicity, I will tell how he introduces Italian queens. He takes a chisel, and pries the top off the hive, and then he cuts all the comb off that sticks to the top; then he blows smoke in at the entrance till the bees all come out at the top; then he catches the queen, then takes the cage with the new queen, and sets it into the hive on top of the comb, and lets it sit there 24 hours; then he lets her out, and she crawls down between the combs, and the bees receive her gladly. He has introduced five queens with success, and never lost one.

EUGENE COOPER, age 9.

Sherman, Sangamon Co., Ill., Dec. 3, 1883.

Well, I declare, Eugene, you have given the most rational plan I ever heard of for Italianizing bees in box hives. It can be done, no doubt; but if every thing does not go just right, it seems to me it would work a good deal like a man trying to chop wood with his hands tied together.

MOVING BEES AND CUTTING BEE-TREES.

My brother George bought one swarm of bees of Mr. Frank. He has not brought them home yet. When is the best time to move them? Uncle William Gibson came to our house, and he found three bee-trees. He cut two of them, and got the honey; the owner of the trees would not have the other one cut. It was an old elm, and of no account. They were afraid the boys would cut the tree, so he and his wife built up a big fire and stayed by the tree all night, and in the morning they cut it and took the honey. They got six pailfuls of it. What do you think ought to be done with them?

MARTHA E. GAGLE, age 10.

Fort Recovery, Ohio, Dec., 1883.

I think, Martha, a very good time to move bees is during spring, when the weather is not very cold. If they can be moved on a sled when the snow is soft, it shakes them up less than a wagon would.—In regard to that bee-tree, I should by all means say, let the owners have it. In olden times, when forests were open, it used to be customary to accord the bees and honey to the one who found the tree; but now when our forests are comparatively small and all fenced up, I should say the bees and honey ought rather to be considered the property of the owner of the land. Of course, if the man who owned the bees should follow them to where they went into the tree, it would be an easy matter to prove it was his property; but where bees are found as those were, I should just let the matter drop. If the people who own the tree feel like giving your uncle some honey to pay him for his trouble in finding them, of course it would be all right; but if they do not choose to do so, I should say all right, any way. It never pays to quarrel with neighbors. Do you think it does, Martha?

Our Homes.

My meat is to do the will of him that sent me.—
JOHN 4:34.

I BELIEVE it is pretty nearly universally agreed, that about the first thing one has to do is to provide himself victuals and clothing; in other words, the first and most important thing is to be sure of our dinner; because, you know, if we do not have the dinner we shall not be good for any thing very long. It is quite natural to think a good deal of our daily food, and, in common parlance, we speak of it as one of the most important and necessary things in life. I remember once meeting a young man who was studying law. He loved his profession, and made an expression something like this: "I would rather study law than to eat, any time." We understand by such like expressions, that the one who makes them is very fond indeed of the thing under discussion. Children are usually on hand at dinner time, no matter how remiss they are with almost every thing else; yet this is by no means an invariable rule. I know of some pretty well-fed children who sometimes get so taken up with their plays that they are loth to come to dinner when mamma calls them. So people of an older growth often get so much occupied with different pursuits and pastimes they are prone to neglect even their meals. Jesus uttered the words comprising our little text when his disciples, after having repeatedly asked him to eat, queried among themselves as to whether he had not had food. If you turn to the fourth chapter of John, you will learn that in his travels he sat down wearied by the side of the well. While he rested there, the disciples went to a neighboring town to purchase food. We infer from the story that our Savior was tired and hungry and faint.

The wells in those days were of little benefit to a traveler unless he had some means of drawing the water. They did not have chain pumps or old oaken buckets, with tin cups and tin dippers hanging out invitingly as they do now; therefore he was compelled to wait until some one came to draw water. I have before directed your attention to the fact that Jesus, while on earth, seemed to have just one great desire and anxiety in life. Most men are given to some especial point, or hobby, as it were; that is, almost all of us have some particular thing in which we are more interested than in any thing else. Many of us have one passion of our lives, as it were. Sometimes it is bees or bee-keeping; sometimes it is to amass wealth. Sometimes it is zeal in the temperance cause, or other things of a like nature.

In studying carefully the life of Christ, we very soon learn that the prevailing thought and intent of his life was to save men from their sins. He went around among sinful people, and labored for and with them, but always with one end in view. When he partook of food, we learn that even then his thoughts were busy and intent on this work of saving souls. Jesus asked the woman to give him some water. But we who know

the story well, feel that, while he did so, his anxiety for the salvation of her soul far overbalanced his sense of thirst, and that his desire and wish was to draw her out in conversation in such a way that he might better open up to her the way to eternal life. She, like almost any other one of her tribe, marveled that he should presume to ask her for water, because the Samaritans had no dealings with the Jews. Before the conversation was ended, this woman had confessed her sins, and accepted him as her Savior, for she says to the friends whom she called, "Is not this the Christ?" Now, it has always seemed to me that, although he felt exceedingly wearied and faint before this conversation, yet the thrill of joy he felt in having saved one more soul made him forget, for the time, his weariness and hunger.

Those of my readers who have been instrumental through God in saving a soul can readily understand what this feeling is. A good many years ago, my dear pastor, whom I have so often referred to, spoke to me something like this, shortly after my conversion: "Brother Root," said he, "when you have once tasted the joy that God sends to one who has helped to save a soul, you will remember it as being beyond any thing else this world can furnish." I have thought of this many times; and when one of the boys whom I met in our jail was influenced by me to turn to the Bible and his Savior, I felt that my pastor's words were indeed true. The feeling is a satisfying one—something more real and substantial than any thing you have ever known before. You feel for the time as though you could well afford to let every thing else in the world slip away, if you could only be assured of that one thing. It seems as if God himself were speaking to you, and declaring, "Well done, thou good and faithful servant." The poor humble friends who followed Jesus knew nothing of what had past. He did not immediately explain it to them. I have been wondering if he did not feel as he did when the woman touched his garment, in that other story. You know that he said, "I perceive that virtue is gone out of me." They pressed him to eat; but he said, "I have meat to eat that ye know not of." How many times did he speak that to them in this way, and they, like honest, simple-hearted children, did not see the great meaning beyond the simple words! So they said now, "Hath any man brought him aught to eat?" Then come these wonderful words, the words of our text, "My meat is to do the will of him that sent me."

What a wonderful truth is embodied in that little speech! To do that will was more to him than the world could furnish. He must eat and drink as we do, for he was human as we are. But yet through it all was that great, earnest, and intense longing to do the work whereunto he was called. The world lay spread out before him, and Satan had already tempted him, just as he tempts young men nowadays. Jesus had human longings and human cravings, and he could appreciate and feel for the things of this world, as we do.

If we accept Christ, we must accept him

as human, as well as to accept him as the Son of God. Our pastor made a remark to a young lady at the teachers' meeting, something like this: "My friend, whatever you remember about Jesus, above all things remember that he was human;" and I have often thought of it. It is almost as bad a piece of skepticism to say that Jesus was not a human being, as to say that he was not the Son of God. He had our trials, and bore up under them. He fought against temptations and weaknesses, and hunger and fatigue, and he fought so successfully that God was pleased with him. I have often dwelt on those words that came from heaven, "This is my beloved Son, in whom I am well pleased." Now, God could not have been pleased with one who had not earned his approval, and, following out the same line of thought, Jesus deliberately chose to do the will of God. He was an obedient child; in other words, he could truthfully say, "My meat is to do the will of him that sent me." Not because it was always easier or pleasanter to do that will, but because he chose to obey God; neither was it because he could not disobey, for, if I mistake not, he could have disobeyed, if he chose, just as I can disobey. In studying his life, we find, instead, all along the pathway, it rebuked any unbelief or skepticism we may be likely to fall into. For instance, we sometimes repine because God does not answer our prayers, or does not give us what we crave and ask. Neither did he answer or consent to the request that his only begotten Son made when he prayed in the garden, "O my Father, if it be possible, let this cup pass from me." It is true, he added immediately afterward, "Nevertheless, not as I will, but as thou wilt."

Now, friends, we are taught to follow Christ, for he says, "He that taketh not his cross, and followeth after me, is not worthy of me." And if we are to follow him, can we so live that our meat is to do the will of him who sent us? You may say, we are not sent, as Christ was sent. In answer to which I again and again revert to the passage where we are told to follow him; and again we are told to "seek first the kingdom of God and his righteousness, and all these things shall be added unto you." You see, if our greatest desire is to obey, even as Jesus our Savior obeyed, we have God's promise that he will take care of the meat and the drink and the clothing. Do you not remember where he says, "Take no thought for the life, what ye shall eat, nor for the body, what ye shall put on. Is not the life more than meat, and the body than raiment?" Please read all along through this twelfth chapter of Luke, from which I have just been quoting, and see if we are not exhorted to forget, as it were, our meat and our clothing, in our desire for that spiritual food which God promises to all his children. He says again, "And seek not what ye shall drink, neither be ye of doubtful mind." I can readily imagine that Peter, or perhaps our friend Thomas, of doubtful mind, here interposes:

"Lord, how is it we shall take no thought of food or clothing? Under what conditions may we put these very important things in life as only secondary?"

We may readily infer that the Savior guessed their thoughts, for he says immediately afterward, "But rather seek ye the kingdom of God, and all these things shall be added unto you."

As if that promise were not enough, he goes on still further, and in kind and loving words says: "Fear not, little flock." Were ever any words more appropriate to those poor simple-hearted fellows? And then comes this great and wonderful promise, making food and raiment sink into utter insignificance, so to speak—"For it is your Father's good pleasure to give you the kingdom." As I understand it, not only were they to be supplied with the necessities of life, but to those who will seek God and his righteousness before every thing else the world can afford, the promise is ultimately the whole universe; for you know we have it again in Christ's own words, in that wonderful sermon, "Blessed are the meek, for they shall inherit the earth."

Do you ask me if it is our duty to stop working and toiling for food and raiment, and houses and places of business, and endeavor to follow Christ by having no earthly possessions? No, I do not so understand it. But I do understand, that in all our business operations our foremost thought should be, like that of our Savior, to do the will of our Father; that is, our first and foremost object and aim and passion in life should not be to make money, neither to accumulate property, nor to get education, but to do the will of the Father. Let me try to make a pen-picture for a suggestion. You know how people occasionally get carried away with some single idea or invention of theirs. One learns to handle bees, and he rejoices at every opportunity of having a swarm and transferring a colony. He will even go and do such work for his neighbors, just for the fun of it, working for nothing, in order to test his ability to manage the little insects. Another one loves horses. He loves to prove his ability to so win upon their affections and feelings as to be able to manage them as Rarey did. He does not want any horses to balk; but yet he feels so certain that he can handle a balky horse successfully, he rejoices at the opportunity of being near when a horse does balk. Handling horses is his meat and drink. He would rather do it than to eat, as the young lawyer says. He goes out among horses, working with them without charge, just because he loves to, and loves the horses. His object is not to make money—at least, not for the time being. It is to follow out this wonderful new world that is opening to him in this direction, and to study God, perhaps, through God's creatures. He loves the work, instead of loving the money that it brings him.

Now to go back to this man who goes into business. Suppose he has become thoroughly converted. He has studied the life of Jesus until he rejoices at an opportunity of demonstrating to the world the power there is in the maxims Christ has taught. He reads to the world, and talks to it about turning the other cheek also, when one is persecuted. The world "poohs" at it, because the idea is so much against the grain,

and utterly ridiculous. Our friend, in his zeal to demonstrate that the teachings of Christ are true and right, almost wishes somebody would test his love for his Master by striking him on the right cheek. Perhaps my illustration is a pretty strong one, but I can imagine such an enthusiast on this subject of returning good for evil; and I can imagine, too, that the love and devotion to his Savior should be the prompting motive and the impelling power. Now, this man can not go and get into a quarrel, to demonstrate the power of Christianity; because in so doing he would be entirely outside of Christ's teachings. It would never be consistent for a Christian to do such a thing. "Then," says he to himself, "how shall I manage to get where jangles and quarrels are, in order to test these peace principles?" After some thought he decides, "I will go into some business, not to make money, but to prove to the world that the words of Jesus are true." In going into business he studies the model life again. He endeavors to put himself under Christ's teachings. One of the first things he must do as a Christian business man is to be straight and upright. There must be no prevarication, no evasion, no swerving one hair from the truth. When tired and fatigued, hungry and thirsty, he must be frank and honest—must not excuse himself; that is, he must give the real reason for every course of action he takes up. If he has made a mistake, he must own it up to the full—to the very letter. Profit and loss must not bias him the minutest fraction. Further than that, if his great and inspiring motive is to win souls, and do God's work, he must consent to bear more than his share of the burdens and trials and losses of business when it will, in his opinion and judgment, be the means of furthering this greater and more important work. All else has to be sunk out of sight in the desire to follow out the strict spirit and teachings of the Bible. More than that, he must have a kind and neighborly feeling toward every one. He must show in his looks and actions that it is a pleasure for him to serve people. In waiting on customers, he must look out for the wants and wishes of every one of them, exactly as he would have people look out for his wants and wishes. Nay, more; he must do more for humanity than he asks it to do for him. He must start out with the purpose of being a servant, and of making his service a loving service. When you hear that some very dear friend is sick, and you are prevented from going to him, if some unexpected opportunity should take you right there, you would enjoy waiting on him, and making him comfortable. You enjoy it, because of your regard for him. Now, the individual we are picturing does business, not from a love of gain, but from a love of the busy throng of humanity whom he meets through business. No matter how selfish or disagreeable are the characters that are thrown in his way, out of love to Christ he treats them all in that same friendly, loving sort of way. "Inasmuch as ye have done it unto one of the least of these my brethren, ye have done it unto me." I know I am imposing a great task

upon my ideal character. There are people in this world who have some of these rare qualities, but perhaps none that combine them all. We sometimes meet with successful merchants or clerks who have a wonderful gift of so throwing their whole souls into their business that they can look out for the needs and interests of a customer as if it were themselves, or as one would try to please his own mother, for instance. One can occasionally do this, and it is a comparatively easy thing to love your neighbor as yourself while that neighbor is a pleasant, generous person; but I tell you, friends, just try to work for difficult, disagreeable people in that way, and to keep persistently doing it, no matter how unkindly you are treated in return, requires something almost beyond what is human.

You may say that I am putting more of a load on one individual than he can bear up under physically. Well, suppose while he does all his strength will allow, he does it with the meekness and humility that Christ teaches, and that every one who knows him is at length forced to believe that his meat is not to make money, or get a great name, or praise from the world, but that it is, like our text, to do the will of the Master. Suppose he shows the same zeal and intense devotion in all these things that one does who loves bees and horses, or things of that nature, and that he really and honestly, from the bottom of his heart, cares nothing for the money or property that he may gain, only so it gives him facilities for showing forth the spirit of Christ.

Another element which I have not yet brought in would be that he should be looking up the destitute, and all who are struggling hard against trials and adversity, that he should make his business the means of helping the helpless, rather than those who are able-bodied and can easily take care of themselves; that, instead of selecting helpers for his work, he choose not the easiest to get along with—not the most successful and apt—not the brightest and best educated, but, rather, those who needed the help he could give, until all persons understood his work was Christ's work, and not for the world.

Well, what do you suppose would be the result, friends? I hardly need ask you. It seems to me I can see your faces brighten and soften into a smile already, and I can almost hear you say, "Why, Mr. Root, the thing is incredible—impossible. There is not a man living who can do it. We are all human, and selfishness is so ground into us that it would have to be an angel to go into business and do as you have mapped it out there. But if it could be done, the man would build up the most magnificent business the world has ever known. There is not a doubt of it, but yet I have no faith it could ever be done."

Dear friends, I have been in business—*am* in business—very extensively, and I know something about it. The worst hindrance that I know of to the best and largest business houses in the world (and I have dealt with some of the largest that exist), is selfishness. It is little tricks and twists, as it were,

that spoil confidence and stop trade, or induce customers to go somewhere else, and finally come back to the old place, with the sad feeling that the world is about all alike. We can not expect to find business done according to the golden rule anywhere. To come right home, dear friends, the worst drawback to the progress and prosperity of *our* business is this same feature. It is with sadness and sorrow I am obliged to confess, that, notwithstanding the most careful watchfulness and prayer for God to help me over these besetting sins, I see them cropping out here and there, and all around. And yet in spite of it, our business has been blessed — blessed far more than we deserve. If it were indeed true, that my meat is to do the will of the Master, I should be very different from what I am now. I find this same disposition in the clerks who are working, and it would be strange if it were not there; for they would have to be more than human, if they did not lean toward my interests in all transactions. In the contents of a single mail I find complaints like these. One very good kind friend writes that a pair of scissors we sent him were broken, and that the piece of blade that was broken off was not in the package, and so it could not have been broken on the way. The clerk who put up the order, surely did not do as he would be done by; because if he were buying a pair of scissors, and paid the full price for them, he would want two full blades. Another clerk was going to send a friend a pair of spectacles with the case half an inch shorter, so that they could not be put into the case; and when asked for an explanation, said it was the best that we could do. Cases of a proper size were up on the shelf, and forgotten. To do as you would be done by, would prompt that the clerk should come to me with the words, or something like them, "Why, Mr. Root, you surely do not mean to send out cases that are not long enough for the spectacles the customers buy with them?"

And so it is all through. The prevailing motive in life is not to give everybody else just what you would like yourself, but to get rid of inconvenient stock, and to get it off from your hands. Poor short-sighted humanity, who fondly hope to prosper by such poor short-sighted economy!

In the foregoing remarks I am, perhaps, a little uncharitable, and may be it was this sin of half-heartedness that allowed things to go in this shape, rather than a want of care for the needs and rights of our customers. A great many times things of this kind come about because the person who allowed it to pass did not seem to recognize that it was especially *his* business to attend to the matter. This brings out another element that is needed to follow Christ. It is, that you should protest against wrong, whenever it comes to your notice. Do not fall into the error of thinking that one who follows Jesus must let every thing go in this world just as he finds it. Of course, some wisdom and discretion are needed to decide just how far a Christian should interfere, and how far he should let things pass.

Since the first part of this article was writ-

ten, I have attended a convention at Columbus, and am now home again, bringing many pleasant memories with me. I have made the acquaintance of many new friends, and have received many excellent hints and suggestions from them. I found a new lot of brothers, as it were. And now, friends, perhaps I shall surprise you a little if I tell you of one little simple remark that I treasure up, and thank the kind friend who said it, more than for any thing else I now remember. This friend and myself were having a little familiar chat, and he was asking about the factory, and my boys and girls. Finally, with some little apology, he spoke as follows:

"Mr. Root, I have followed you many years; I read your Home Papers, and love them; and I have often wondered how you bear such a multitude of cares as you carry, being, at the same time, only the slight and frail-looking man you are. Now, after saying this I want to find fault a little. I visited you several years ago; and while there I heard you reprove one of the young ladies, in a way that seemed hardly in keeping with your general character. She made no reply, but seemed very much hurt. Now, I want to know if you are in the habit of doing so often; and if you know how it may hurt your influence, and hinder the work I know you are trying to do."

Although the above were not the exact words, as nearly as I can remember they are the substance. And may God bless that friend for having said them! One whose meat it is to do the will of the Master should be ready enough and bold enough to reprove and to remonstrate in just that way, and under just those circumstances. And my mind ran over the years that have followed since that incident, although I can not now remember it. It was worth more than I can tell, dear friends, to know that I had made *real* progress against that one besetting sin. It has been hard ground to fight over, and for years it seemed as though the progress made was scarcely visible; but through the grace of the dear Master, the hard stern disposition I inherited from away back in the line of the Puritans has been slowly molded and made over. It is but a few days ago since I was congratulating myself that almost a year had passed since I had given way to that fretful, fault-finding disposition, and really "scolded." Now, friends, I have been greatly helped in this work by the admonition, in plain talk, of Christian friends; therefore if you are to do Christ's work you must be ready to reprove in just the way that the friend talked to me at the convention.

Before closing this talk I want to give you a letter, just as it came from a brother who, like myself, is trying to fight the good fight. I believe it will give a good many of us a lift toward eternal life. Let us read it:

Friend Root:—(I wish I could say Brother Root), I can not do without GLEANINGS. I would as soon do without my supper. I can thank you for one thing, at least, for sending out sample copies. I sent to you for one in 1878. I then took the bee-fever. I read and re-read that number until I dreamed of bees. I then sent for a dollar queen and two hy-

brids. The hybrids were a failure, but the dollar queen is as good as I want for that sum of money. After I first saw her laying, I saw yellow bees almost every night. If you ever saw a happy fellow it was I when the first Italians came out to play one evening; then I had the bees, and did not know how to take care of them. I concluded to take GLEANINGS. It did not take me long to think you were a better man than I was. The Home Papers were the first thing to read, and I can thank God to-day for them. After following you in your trials I saw things in a different light, and yet I am a sinner. It seems impossible for me to be a Christian. When I get to be tolerably good (in my own opinion), some one gives a push backward, then good-by to religion for awhile. I am so weak on that point, it takes a good while to get up there again. There are three things in "Paradise" superior to religion. They are drinking whisky, swearing, and chewing tobacco. The men and boys swear almost to a man (or boy) as the case may be. I do neither, and yet I feel the need of more of the right kind of spirit. I know right from wrong, but the flesh is stronger than the spirit. I would tell you more of my trials, but have written too much now. Please forgive me this time, for I believe you are a friend to sinners. I wish you success in your undertakings, for I believe you deserve the blessings of God and man.

Paradise, Mo., Dec. 15, 1883. JAMES T. SWAN.

There are several points in I would call your attention to in the above. Friend S. says he likes GLEANINGS as well as his supper; and a little further on, that he dreamed of the yellow bees almost every night. That is a good symptom, friend S., that you are making progress in bee culture; and in the same way it is a good symptom when you dream of holding in your temper while you are trying to be a Christian. I remember that, for the first year after my conversion, when I used to dream that I had given way to my temper, I awoke in awful remorse and sorrow. By and by, perhaps after a year or more, I used to dream of praying when tempted; and, oh what a relief it was! for in answer to the prayer of my dream a loving Savior always responded promptly. Friend S. imagined that I was a better man than he was. But, you see he did not know me. He says it seems impossible to be a Christian. My friends, he had that feeling just because he had squared himself right before Satan, and had begun the fight. Don't be frightened when you feel the same way; never, under any circumstances, say for even one brief second, "Good-by, religion." We all know, dear friend, that it takes quite a little spell to get back after we once yield to temptation, and get away. I hope, dear friend S., that I am a friend to sinners, even as the Savior was and is a friend to sinners like myself. Never hesitate about saying right out, "Brother Root," when writing to me. The term "brother" gave me a thrill of pleasure the first day I went into the prayer-meeting, and I have not forgotten the pleasant sound of it yet. It comes with even more of a thrill, if any thing, when it is used by those who have not yet made an open confession, for it means to me a recognition of that one great Father, and the infinite love that he so freely extends to us all, even though we be sinners.

Now, then, dear friends, how is it? What is your meat? Is it bees and honey, and the things of this world, or is there really an under-current, stronger and greater than all the world can furnish, to do the will of Him who in loving kindness died for us?

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE
OF READING MATTER.

MEDINA, JAN. 15, 1884.

Do good to them that hate you.—MATT. 5:44.

Who can furnish us with some horsemint seed?

A DISCOUNT of two per cent will be given on all orders before Feb. 1.

UNTIL further notice we will pay 10 cents each for the following: January JUVENILE, February GLEANINGS and JUVENILE, and May JUVENILE, 1883. And all numbers of 1875.

LEST some one take our friend to task who writes a little poem on p. 59, for saying the bees carry the wax upon their legs, I would suggest that he probably means by the term wax, the propolis which they get from balm-of-gilead and other similar trees.

A GOOD many years ago we made honey-extractors to turn the frame inside of the extractor. As it made quite a little more expense, we never recommended them very much. As several of our friends are now calling for such, we will say that we can furnish them made in that way for any kind of frame for \$1.50 more than the usual price. This additional expense is because a larger can must be used, as well as larger inside work.

BEE SWAX, AGAIN.

We are sorry to say, that we shall be obliged to advance the price of fdn. 3 cts. per lb. on all orders received after the last mail on the last day of January. At present we will pay 33 cts. per lb. cash, or 35 in trade for wax. Our selling price will be 40 cts. for common run, and 48 for selected. We hope there is a stock in the old countries that can be profitably shipped to us at these prices.

DECLINE IN PRICES.

WHILE we are having jangles about the advance of wax and glass, it is pleasant to know that on other things we are having a decline, and I do not know that I ever heard anybody complain when I charged him less than the printed price. Singular, isn't it? Well, the enamel cloth that we have been selling so many tons of, we can now furnish you for 20 cts. per yard (45 inches wide, remember), or a whole piece of 12 yards for \$2.25; 10 pieces for \$20.00. Nails of all kinds are very much lower than our price list gives it. Prices furnished on application. Our celebrated \$1.50 scale is now only \$4.00; 2 for \$7.50. There is also quite a decline in screws, and on many of the counter goods, all of which you will find in our new price list now in press.

TOBACCO OR WHISKY?

A FRIEND takes exception to our statement, that tobacco is doing more harm than intoxicating liquors. I presume that those who hold to this opinion mean that tobacco leads indirectly to more harm; for those who never commence to use tobacco, rare-

ly if ever commence whisky. Did you ever know a man to drink, who did not use tobacco first? Dr. Kellogg says that the boy who voluntarily commences to use tobacco which he does *not* like will surely take up with the next vice that presents itself to him, that he *does* like.

THE FOUNTAIN PUMP.

THE inventor and manufacturer of this beautiful little implement has decided, like the publisher of the Story of the Bible, that he can not let me retail them any more at 75 cts.; therefore the price will be, hereafter, \$1.00; two for \$1.75; or one-fourth dozen for \$2.25; so you see that you will have to "chip in" as above, if you want them at the old price of 75 cts. as there will be quite a saving on freight and express by so doing, it will not be so bad an idea, after all.

QUITE a number of the friends have written at different times, telling us to keep GLEANINGS going as long as it is published, and when we want the pay, to send in the bill. Now, we should be very glad to keep right on sending it to you year after year, if we are only assured that you want it; therefore our subscription clerk will hereafter put a letter O on the label to your journal, and this means that we are not to stop it until you tell us to. We expect, of course, you will send us \$1.00 each year, on or about the first of January. But the idea is, the paper is not to be stopped until you order it stopped.

STORY OF THE BIBLE.

THE publisher of the above book absolutely forbids my selling it at retail at the very low price of 75 cts. each, and is not willing to let me have the books unless I sell single copies at not less than \$1.25 by mail, or \$1.10 by freight or express. I can, however, sell two copies for \$1.75, or one-fourth dozen for \$2.25; so if you want it at the old price you will have to get two of your neighbors to join in with you, making a small wholesale transaction of it. Remember that the postage is 15 cts. in any case. As the book is wonderfully cheap at even \$1.25, I presume the publisher is right in regard to the matter.

CHANGE IN THE PRICE OF THE BRITISH BEE JOURNAL.

THE *B. B. J.* is now, like GLEANINGS, a semi-monthly. But they have advanced their price to 7 shillings, which would be about \$1.75 a year, of our money. The best arrangement we can make with them will make it necessary to charge \$1.40 for it to our subscribers. This includes postage and all. As we have heretofore been exchanging the *B. B. J.* for GLEANINGS even up, we shall be out of pocket, unless the friends whose subscriptions run into 1884 will make it up to us at the rate of \$1.40 per year. Subscriptions may be sent us as heretofore, and we will mail the journals as we receive them from England, all in one package.

DIVISION-BOARDS AND DUMMIES.

AFTER the article from friend Porter was in type, he sent us the following:

Another advantage in favor of the full 10-frame hives should be named. Those who winter on the summer stands can leave the dummies or division-boards in, or replace with a cushion on one side, and give that much more protection.

While we are about it, why not use a frame of sections in place of the dummy, and then the bees will have room to store in on the side as well as on the top of the brood; and this is exactly the way we have for years managed Simplicity and chaff hives

for side storing. If we really do not want the bees to store honey at the side as well as above, put in the chaff-cushion division-board in common use. Then they will all be ready fixed for winter, as friend Porter suggests.

DECLINE IN HONEY, SUGAR, ETC.

OUR friends may read all the sugars in our price list at $\frac{1}{2}$ cent lower, with the exception of the Early Amber. With the decline we have had in sugar, honey seems likely to come down some, and we have been offered very choice honey so low lately that we now offer it for an even 10 cts. per lb., in lots of not less than 50 lbs. At this low price you will have to furnish or pay for the package. The most convenient shipping-can is the iron jacket. A five-gallon can is worth 68 cts., which makes the price of the can, honey and all, \$5.68; or a 100-pound can, can and all, \$11.10. It seems to me at these prices honey should come into general use as an article of diet. The honey we offer at this price is clover and basswood. We can furnish you goldenrod and other fall honey at one cent lower still.

A WORD TO THOSE GETTING OUT PRICE LISTS OR CIRCULARS.

I FEAR some of the friends, in ordering circulars, especially those containing considerable matter, overlook the fact that it costs as much to set the type for 500 as for 10,000. For instance, a price list like friend Doolittle's can be made for 2 cts. each, providing 5000 or more are wanted at a time; whereas if somebody wanted only 500, they would cost 10 cts. each—\$50.00. Friend Viallon also has a very pretty price list, but he had only 1000, so they cost him about $3\frac{1}{2}$ cts. each. After the type was all up, and we had got it in the press, ready to print, we could easily have given him another thousand for not over $1\frac{1}{2}$ cts. each. Now, it seems to me when you go to work to get up any thing that costs so much, it would be well to have an extra thousand or two, before the type is distributed. If you want to increase your business, it seems to me that they surely would be worth what they cost, to give away to your customers, or to hand around among their neighbors.

"WHY DO I HAVE TO KEEP WRITING, TO MAKE MY JOURNAL COME PROMPTLY?"

WE are sometimes severely blamed because subscribers have to write repeatedly, to get missing numbers. Now, friends, they are all mailed from here promptly; that is, they all go from our office wrong, or they all go right. When the address is once in type, it stands, unless you order it changed, and GLEANINGS is issued regularly. We do not skip for Christmas, for Fourth of July, or any thing of the kind. Now, as the trouble must be at one end of the route or the other, it seems to me the fault must be at your postoffice. A great many have got at the mischief by interviewing the postmaster, and inquiring if there were not some one else of the same name, or nearly the same, who got their mail. It is gratifying to us to know that people who are not bee-keepers often like to read GLEANINGS; and when it gets into their box they take it and use it, even if the initials of the name are not what they ought to be. Of course, we will always cheerfully send another copy whenever you miss any particular one, and we are always glad of the opportunity of furnishing extra copies for samples; so if you can stand it we can.

PUT ON YOUR COUNTY.

The troubles, losses, vexations, and disappointments, in consequence of having goods sent wrong on account of the county being omitted, are not yet over. You may say that we can find the county by the Postal Guide; but the Postal Guides are often wrong. Every man knows better what county he lives in, than anybody else; and it seems to me he is the one to tell. A friend writes to-day that he does not think he should be held responsible for omitting the county, as he had given it in his previous letter. The trouble is, friends, how can we know that there has been a "previous letter," unless you say so? Old regular customers we can remember, it is true; but where from 100 to 200 letters are coming daily, just think of the task of looking up the correspondence for each one who omits to give his county. I do not see any other way than to have it printed on all your stationery.

THE PURPLE BASKET.

In my article on half-heartedness on p. 16, last number, I told you I would at once make some arrangement for matter demanding immediate attention. Well, we have got the arrangement. It is a little willow basket with a card securely tacked to one side. On this card is printed in plain black letters,—

To clerk receiving this basket: Attend to contents immediately. Then give to next clerk to whom it belongs. Be sure to have an answer of some kind got out by next mail. When you can't get any further with it, put it on my desk. A. I. ROOT.

On the other side of the basket we have got this:

Don't let this basket rest.
Till it fetches round on Mr. Root's desk.

The basket was finished just before opening a large mail, and I tell you it did excellent service just that one day. It was traveling almost constantly, and reached nearly every desk in the office during the day, and resulted in straightening out a good many jangles, and getting replies back to the badly used friends by the very first mail. Now, then, when you write something that needs urgent attention, just say, "The clerk who opens the mail will please put this at once in the purple basket." And then if you do not get some kind of a reply by return mail, it will be funny.

SETTLING ACCOUNTS.

As usual at the close of the year, we have more or less wrangling in attempting to settle up all unfinished balances; and there is one point on which I fear a good many of the friends misunderstand us. It is not that we wish to get every cent that is due us, but we want things *right*. If there is 25 cts. due us, we want it; and if there is 25 cts. due you, we want to pay it, and I hope we are just as vehement in trying to have the latter made right, as the former. I have been accused of being "ferce on a dun." I think likely I am, dear friends; but many of you have found out that I am "ferce" when the balance is the other way. The clerk who has charge of the matter tells me that we have sent statements to about 1500 people who have credits here, and sometimes we have had quite a jangling in trying to make them take what belongs to them. For instance, after a credit has stood a year, and we do not get any reply in regard to settlements, we write to the postmaster. If he says the man has moved away, we write to the postmaster where he now resides, and so on; and a few of the friends have got

indignant about it, and have told us to give it to some charitable institution, and stop dunning them with postals. Please bear in mind, now, will you not? that our business has gone beyond my immediate eye, or my recollection, and that a great part of it is done by clerks who simply follow established rules; and I hope you will find them just as anxious to pay the debts of the establishment as to collect them. You can not think how it lubricates the wheels of the machinery of our business to have all of you reply promptly when you get a card of debit, or credit either. If our account is not right, please "say so;" and if it takes of your time, and postage too, say so. Make out your bill, and I will gladly pay it. If you are awful busy, just tell your little girl to write us about it. I like to do business with little girls, and little boys too, for they will almost always talk, and they generally talk right out, no matter whom it hits.

CONVENTION NOTICES.

The Maine Bee-Keepers' Association will hold their annual convention at Lewiston, Feb. 14 and 15, 1884. F. O. ADDIXON, Pres.

WM. HOYT, Sec.

The 15th annual convention of the Northeastern Bee-Keepers' Association of New York will be held in Syracuse, Jan. 22, 23, and 24, 1884. Judging from the programme we have received, a profitable time is anticipated.

CIRCULARS RECEIVED.

Friend I. R. Good, Tullahoma, Tenn., has sent us a postal price list of queens and bees for 1884.

U. E. Dodge, Fredonia, N. Y., has sent us a one-page price list of bees, queens, and supplies.

Bright Bros., Mazeppa, Minn., send out a very pretty price list for 1884, we presume, although it is dated '83.

M. H. Hunt, of Bell Branch, Mich., has just ordered from our press his annual circular of apiarian supplies.

As you will see in another column, we have just shipped friend Viallon his regular annual announcement for the coming season, relative to bee matters.

Guyton Bros., Waco, Tex., have likewise lately received from our job rooms their circular and price list of bee fixtures for 1884.

Friends Flanagan & Illinski, of Belleville, Ill., have also received from here their annual price list of bees and apiarian supplies.

Lest you may think our printers have not been very busy this past month, we will add that they have also just printed a price list of apiarian supplies for F. A. Salisbury & Co., Geddes, N. Y., and have several more now in process of completion, which will be duly announced when done. In sending for estimates, some of the friends have asked for low rates, on account of this being the dull part of the season. Please remember that winter is the printer's harvest-time, and summer his vacation. The rush in the saw-room seems to be transferred to the type-room just now. But whether we do the work in summer or winter, we will always give our lowest rates; and please remember, too, that our rates include the free use of any of our cuts. Would it not be well to bear this in mind when saying that other parties will do your work for a little less?

Mrs. Cotton sends out a new circular for 1884, and also a new and revised edition of her bee-book. I can not find that she offers the book for sale, except with the drawings and illustrations for making the hive, at *four dollars*. I do not see how we can consistently give any different advice to those who make inquiries in regard to her, from that we gave a year or so ago, as follows:

I am being asked my opinion of the new circulars Mrs. Cotton is again sending out quite plentifully. The statements she makes, and the prices she charges for the goods she sends out, would, in my opinion, forbid her being classed with our regular supply dealers, to say nothing of the strings of complaints against her that have filled our bee-journals for years past.

OUR 20-Cent COUNTER

As a rule, no one has complained that the goods in our counter store were high-priced, for, in fact, the success of the plan depended on selling goods for even change, and that the labor saved by so doing would enable us to sell them less than usual. Well, there have been a few complaints that some of the 25-cent goods were high in price. The reason of this is, that any article costing 15 cents or over must be sold, a single one at a time, for 25 cents. We have often thought of a 20-cent counter, but disliked more complication. However, the trade has at last grown to it. Below we give you a list of the goods taken out of the 25-cent counter, which will be hereafter 20 cents each. Wholesale prices will, of course, be as heretofore. Also some new goods.

[Pr. of 10, of 100]	
3 BIT, best make, 3/8, 5-16, 1/4, or 3-16	1 85 17 50
18 BRACE, Carpenter's, with set screw, just right for tapping trees	1 60 15 00
2 BRUSH, COUNTER, neat and useful	1 75 16 00
4 BURNER, (Lamp), Sun hinge, No.	1 85 17 50
48 CLOTHESPINs, best wooden, 6 doz. in a basket, basket and all, only 20c	1 60 15 00
5 FILE, DOUBLE-ENDER, 10 in., with handle	1 60 15 00
9 FILE, FLAT MILL, 10-inch	1 85 17 00
18 GLUE, 1 pound	1 80 20 00

For making cinematographs, or carpenter's use; an excellent article.

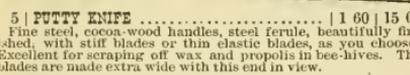

8 HAMMER, METAL HANDLE, inlaid with Walnut, Light and Handsome	1 60 15 00
19 HATCHET, chilled iron, Painted Red	1 65 16 00
2 KNIFE, 2-BLADE, Fine Quality, Am.	1 90 18 00
6 OIL STONE SLIP, the best	1 70 16 00
18 PARAFFINE, per lb.	2 25 21 00

For waxing honey barrels, putting in starch, etc. etc.

2 PENCIL, AUTOMATIC, Eagle	1 65 16 00
10 PAPER, or box of stationery	1 75 16 00

3 PLYERS, FLAT NOSE, ROUND NOSE, and LONG NOSE	1 75 16 00
--	--------------

These are polished steel, and a very pretty and useful tool.

5 PUTTY KNIFE	1 60 15 00
3 ROBINSON CRUCOE, Complete	1 75 16 00
3 SCISSORS, CENTS' solid steel	1 80 17 00
4 SHEARS, solid steel blades, nickel-plated, 6 1/2 inches long	1 85 17 50

In order to get such a wonderful bargain in these little shears, I ordered at one time 100 dozen.

4 SOCKS, celebrated Shaw knit	1 90 18 50
3 SPOON, table, (Hall & Elton's) G. silver	1 85 18 50
1 STEW PAN, STONE WARE, glazed	1 75 16 00
10 THERMOMETER, Best, 10 inch	1 50 14 00
20 WISE to screw on the bench, with anvil, small, but a very handy tool	1 70 18 00
7 WIRE, galvanized, one pound, No. 17, on spools	1 80 16 00

GLASSWARE.

1 HONEY DICH, with cover	1 75 16 00
1 BUTTER-DICH, Albion pattern	1 75 15 00
15 JINE STAND, snail-shell pattern, mounted in bronze, very pretty	1 75 16 00
1 LAMP SHADE, PORCELAIN	1 80 16 00

Same as 15c counter only 7 in. Brass ring to support them same price

1 TOY SET, CHILD'S, very pretty; butter-dish, pitcher, spoon-holder, and sugar-bowl in a nice box	1 80 17 00
1 BREAD PLATE, "Our daily bread"	1 85 17 50
1 SALTS, individual, 1 doz. in a box	1 85 17 50

TINWARE.

17 CULLENDER, full size, 11 in.	1 65 15 00
1 GALLON MEASURE, with lip	1 75 16 50

1 DISH-PAN, 13 1/4 in. across, 6-qt.	1 75 16 00
Stamped and re-tinned, a most beautiful and useful utensil for the kitchen.	
20 PAIL, COVERED, 4 qt.	1 60 15 00
10 PAIL, lettered and painted "Pure Honey," 2-qt.	1 75 15 00
18 PAN, SAUCE, with lip, beautifully re-tinned, and looks as handsome as Silver-plated, holds 3 qts	1 80 16 00
1 TEA OR COFFEE POT, 1 1/2 qt.	1 85 17 50

A. I. ROOT, Medina, O.

ATOMIZER, OR SPRAY-DIFFUSER.

The little instrument shown above is very convenient where bees are to be sprayed, or for any purpose whatever, whether for treatment of foul brood by salicylic acid, or for scenting a colony for introducing queens and uniting stocks. The instrument is very neatly made, the metal work all nicely nickel-plated. Extra valves, and needles for cleaning the tubes, accompany each instrument. It is worked by the rubber ball B. The whole packed in a strong neat box. Price \$1.00; by mail, 10 cts. extra

A. I. ROOT, Medina, Ohio.

PRICE LIST OF ITALIAN QUEENS AND BEES,

And Bee-Keeping Fixtures, sent free to any address.
GUYTON BROS.,
 2-3-4d Waco, McLennan Co., Texas.

Being Largely Engaged

In bee culture, I keep always a full supply of Bees, Standard Langstroth, and movable-frame Hives. Those white figured sections, noted throughout Canada; comb foundation, and all apiary requisites. An experienced apiarist wanted.

ASHMEAD SIMPLICITY BEE-HIVE!

Simple, cheap, and practical. This hive does away with all frames for comb honey; and as it is in tiers, all the heat of the hive is confined just above the brood-chamber. Can use it with or without separators. Send \$1.50 for a sample hive, and write for prices in the flat. Manufactured by T. GRAHAM ASHMEAD, Williamson, Wayne Co., N. Y.

Stanley Dollar Smokers

U. S. Standard Honey-Extractor: 10% off list price. Also other supplies very cheap. See advertisement in January GLEANINGS.

G. W. STANLEY & BRO., Wyomung, N. Y.

1884; COLONIES, NUCLEI AND QUEENS, FOR SALE. 1884.

For terms, address S. D. McLEAN, 3-5-7-9d iq COLUMBIA, TENN.

A Full Line of Apiary Supplies.

Headquarters for the West. Send for price list. Cash paid for beeswax. HOWE & SON, 1-6d No. 303 Broadway, Council Bluffs, Iowa.

CYPRIANS and SYRIANS direct from their queens before June 1st, \$10; extra fine, \$12; during June, \$9; extra fine, \$11; and carnolians imported from Carniola, and Italians from Italy. Fine queens before June 1st, \$9; extra fine, \$7; during June, \$5; extra fine, \$6. Any six queens, 5% off; ten, 10% off. Safe arrival. Expressage prepaid to N. Y. Send U. S. bills in registered letter to 3-5-7-9d FRANK BENTON, Georgen St., 8, Munich, Germany.

STEAM BEE-HIVE FACTORY OF THE WEST.

Hives and sections of all kinds. Italian bees, colony or nuclei; comb foundation, smokers, extractors. Best and cheapest saw mandrel made; Babbitt boxes all complete, 20 inches long, \$6.00. All supplies very low for cash. E. Y. PERKINS, 3-5-7-9-11-13d Jefferson, Greene Co., Iowa.

Dadant's Foundation Factory, wholesale. See advertisement in another column. 3bftd

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with *, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

Basswood Sprouts,

FROM 1 TO 3 FEET HIGH. \$1.50 per hundred; \$10.00 per thousand. All orders should be in before April 1st, 1884, to receive attention. 12½tfd HENRY WIRTH, BORODINO, N. Y.

Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

CITY MARKETS.

NEW YORK.—*Honey.*—Since our last report we find no improvement in comb honey. The general depression in all branches of mercantile business the past month, no doubt, has kept honey from moving off more rapidly; retailers supply only their wants in a hand-to-mouth way, buying only as they have need, and no large lots moving at all. Prices are quite irregular, and the tendency on nearly all grades is in buyer's favor. We quote as follows: Fancy white-clover in 1-lb. sect's, no glass, 18 @20 Fair to good " " " " " " 16 @17 Fancy white-clover in 2-lb. sect's, glassed, 17 @17½ Fair to good " " " " " " 15 @16 Fancy buckwheat " 1-lb. " no glass, 15 @16 Fancy " " 2-lb. " glassed, 13½ @14 Ordinary grades, " 2-lb. " " 12 Ext'd honey, best white-clover, in kegs or small bins, 9 @ 9½ " " " " " " 8½ @ 9

Beeswax is very scarce; and what there is in this market is selling readily at prime yellow, from 35 @ 38½ per lb. McCADL & HILDRETH, 80 Hudson Street, New York, Jan. 19, 1884.

CINCINNATI.—*Honey.*—Nothing new to report of the honey market since my last. Prices of extracted honey have not changed, but there is some improvement in the demand. Comb honey is in good supply, and prices are lower. A choice article in 1-lb. sections does not bring above 16c. from store. *Beeswax* in fair demand, and brings 28 @ 32c. on arrival.

CHARLES F. MUTH, 976 Central Ave., Cincinnati, O. Jan. 22, 1884.

CLEVELAND.—*Honey.*—The honey market is a little dull just now, as usual, after the holidays, but values are unchanged. Best quality 1-lb. sections sell at 14 @ 19c.; 2-lb. sections, 16 @ 17c.; second quality, 12 @ 14c., but the latter is very dull. Extracted, no sale. *Beeswax* wanted at 28 @ 30c. A. C. KENDEL, 115 Ontario St., Cleveland, O. Jan. 22, 1884.

BOSTON.—*Honey.*—Please quote our market as follows: Demand light; 1-lb. comb selling 18 @ 20c.; 2-lb., 16 @ 18c. Extracted, 9 @ 11c. *Beeswax*, 35c. BLAKE & RIPLEY, 57 Chatham St., Boston, Mass. Jan. 23, 1884.

MILWAUKEE.—*Honey.*—The honey market here is very fairly supplied with a good quality of section comb, and I think better than in the seasons past. Can quote 1-lb. sections, white, 17c; 2-lb. sections, white, 16c. Extracted in liquid, put up in pails or cans, white, 10c; extracted in kegs or barrels, and candied, 8 @ 9c. Dark-colored common honey not wanted. A. V. BISHOP, 81 & 83 Detroit St., Milwaukee, Wis. Jan. 24, 1884.

ST. LOUIS.—*Honey.*—Extracted honey continues dull; nominal 7½ to 8 cents in barrels and half-barrels; in cans, at retail, 10 cents. There is very little doing in comb honey, unless at low figures; 15 to 17 cents at retail, if in good order.

Beeswax is scarce, there being none coming in worth speaking of. A good article is worth 35 to 37½ cents. Stock is very small.

W. T. ANDERSON & CO., 104 N. Third St., St. Louis, Mo. Jan. 26, 1884.

KANSAS CITY, Mo.—*Honey.*—Receipts liberal, and sales satisfactory. White comb, 1 and 2 lb. sections, 17 @ 18c. I could place a few thousand pounds of fall extracted honey at 8 to 9c. JEROME TWICHELL, 536 Delaware St., Kansas City, Mo. Jan. 22, 1884.

Our friend Jerome Twichell, who gave us such good advice last month, adds the following:

Place a sheet of stiff manilla paper between each row of sections in the case, which will prevent one comb from falling against another when it becomes loosened in the frame. When a comb breaks loose and falls against the next one it is liable to force that one out of place too. The stiff paper between will prevent all this, and save many a pound of honey which otherwise would have to be removed and put in pails, and sold as broken honey. I discovered this idea in overhauling the cases which on arrival showed any loose combs, and found that by straightening them up and putting the paper between them I could save all that were not broken or mashed. If this plan is adopted, shippers will receive very few complaints of honey in bad condition.

It seems to me that the above, although a simple matter, is a most excellent suggestion. We can furnish heavy manilla paper, cut into sheets and strips, to exactly fill our shipping-cases, any of the different sizes, at 15c per lb. I do know that a section is often spoiled, in appearance at least, by having the honey drip from some other one on to it. The above plan would almost give each section a box by itself, and would aid very materially in keeping them from getting out of place, and bruising each other.

Bees For Sale!

15 STANDS ITALIAN BEES,

All are VERY strong (having been 2 and 3 story hives last summer), plenty of good honey, to last till June; will guarantee safe arrival and healthy condition. Simplicity or VanDeusen-Nellis hive; wired frames, 1½-story hives. Price \$5.50, f. o. b. cars here.

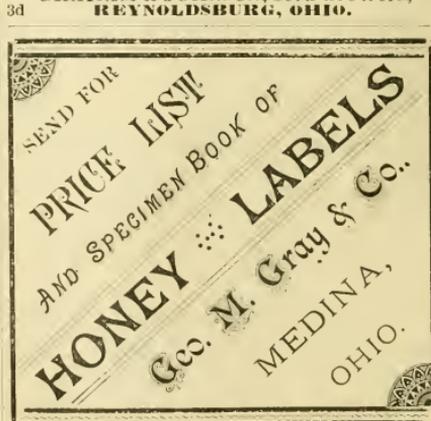

Address,— L. A. PORTER, Poplar Bluff, Mo. 3-5-7-9d

THE ALL-PURPOSE HIVE.

Arranged for continuous passage-ways, continuous combs, no honey-board, no bee-space, chaff and single-walled, no patent. Sample in flat. Given fdn., sections, etc. GEO. F. WILLIAMS, 2-3-4-5-6-7d New Philadelphia, Ohio.

SEEDS.

Our Illustrated Price List of Select Garden Seeds will be sent FREE to all applicants. Send for it, and buy your seeds direct from the growers. We will sell you no seeds but those we would be willing to plant in our own Gardens. Address GRAHAM & JOHNSON, Seed Growers, REYNOLDSBURG, OHIO.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canada. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

NO. 51.

THE OTHER SIDE OF BEE CULTURE, ONCE MORE.

FRIEND ROOT:—Away back in 1878, when I was writing my first articles for GLEANINGS, you wrote to me as follows: "Friend H., when you have had more experience with bees you may do much good by writing in that same frank, honest manner in which you have started out." Again you wrote: "The way in which you write, without fear or favor, is what especially pleases me." On page 531 of GLEANINGS for 1882, in speaking of myself, you say: "The extreme honesty and fairness of his articles, and a sincere desire to benefit his bee-keeping brothers, is what gives the chief value to his writings." Now when, in this same "frank and honest manner," "without fear or favor," in all "honesty and fairness," and with "a sincere desire to benefit my bee-keeping brothers," I criticise your wares, methods, or journal, why do you feel called upon to exclaim: "What is the matter with you lately, friend H.? You have not got astray into bad company, have you?"

You admit that you think it wrong to induce people to engage in bee-keeping, by presenting the bright side of it; yet, isn't the would-be bee-keeper, who sends for a sample copy of GLEANINGS, quite apt to receive the *impression* that bee-keeping is a bonanza? I do not consider you as altogether to blame for this, because people, as a general thing, will report their *successes* and say nothing of their *failures*; but if, between such reports as that of

friend Dixon, on page 9, and that of friend Bliss, on page 21, could be sandwiched something like the following: "Our location is not very good for honey. It requires good bees well managed to get *any* surplus, and some have given it up as a bad job," then bee-keeping would be shown up in its true light. The above quotation is an extract from a letter received yesterday from Prof. John Phin, of Cedar Brae, Paterson, N. J. I have no objection to "big" reports, just to show the "possibilities" of bee-keeping, if they are only interspersed with "little" reports to show the "impossibilities." These big reports, however, are not so objectionable as the promulgation of the idea that bee culture, as a general thing, in the long run, is a *grand* success; in fact, a regular bonanza for *almost* everybody. I am aware that the books and journals do, to a certain extent, show up the "other side" of bee culture, but the manner in which they do it reminds me, in one respect, of the regulation love-story; it makes little difference how many trials, troubles, and tribulations the hero and heroine are called upon to endure, *every thing always comes out all right in the end*. Here are a few extracts that I have clipped from an address by our common good friend, the Rev. W. F. Clarke. I suppose everybody knows that it is always safe to bring any thing in that friend Clarke ever wrote or said. Here is what he did say:

"WHO SHALL KEEP BEES?"

"'Everybody,' was once the current answer. I have given it myself before now. Ten years ago, in my prize poem on 'The Honey-Bee,' I pictured

'Each household of an apiary possessed.'

It was the general idea then, that, in a proper con-

dition of society, a bee-hive out of doors would be considered as much a part of a well-regulated establishment as a sewing-machine indoors. But we have got bravely over that, and the time has now fully come for insisting upon it that only those should keep bees who are properly qualified to do so. That same law of division of labor which forbids every man being his own shoemaker, tailor, or blacksmith, prohibits every man from being his own honey-producer. This is not a congenial topic for the bee-journals, many of which are, more or less, mixed up with the supply business. Of course, the more people who start bee-keeping, the greater will be the sale of supplies.

"Bee-keeping may be justly regarded as having attained the status of a profession, or a business. In any correct view of it, it requires special natural qualifications, and a thorough education. The natural qualifications are not of much account without an education, obtained somehow or other, and the education is a downright impossibility without the natural qualifications.

"It is no doubt possible for a tyro in bee-keeping to become self-educated, in a sense. With the invaluable bee-books and excellent bee-journals that are available, the theory can easily be mastered. Then comes the practical part, and, 'aye, there's the rub.' To manage bees with an eye to profit from honey-production, is an attainment far beyond mere theory, however correct. I do not think this can be gained in any other way so quickly or so well as for the beginner to apprentice himself to some good practical bee-keeper."

I presume that I am trespassing upon your patience, and occupying valuable space; but I hope that I may be allowed to quote from an article written by our good friend Dr. C. C. Miller. I presume that it is also safe to bring any thing in that friend Miller ever wrote or said. Some one wrote to the doctor, asking for his advice in regard to engaging in bee culture, to which he publicly replied as follows:

C. C. MILLER'S ADVICE IN REGARD TO KEEPING BEES.

"It is painful to think, that to this and similar inquiries we can give no reply that we can feel sure may not mislead. To 9 out of 10 of every such persons it would be a real kindness to dissuade with all our power; while, perhaps, 1 out of 20 or 50 might be urged to embark in apostical pursuits to the abandonment of all others. But it is no easy matter to determine who may be the 20th or 50th one; hence it is a very difficult matter to give any honest advice, without an intimate acquaintance with all the circumstances of the inquirer. I have blamed the editors of our bee papers, in that the drift of the contents of such papers was to show the bright side only of bee-keeping, thus inducing into the business many not adapted to it, much to their after-regret.

"But I am not sure that the papers are at all to blame. All they can do is to publish such items of information as come within their reach, and most of us like much better to send in reports of our successes than of our failures. It is quite flattering to my vanity to report: 'I have this year commenced with 174 colonies; increased to 202, and taken over eight tons of comb honey.' Would I be as prompt to send in the following: 'This year I devoted my time exclusively to bees; commenced the season with 200 or more colonies; diminished by loss and

doubling up, so that I had 102 colonies in the fall, and took, in all, 58 lbs. of honey. By means of the business I am \$1000 poorer than I was a year ago?' Would the latter report be as much noticed and copied as the former? The former is a correct report of my success this year. The latter is just as correct a report of my failure two years previous, and I have no assurance that I may not have a similar report to make the coming year.

"But, suppose I hear of one who makes a success of bee-keeping, year after year, who has made thousands of dollars at it. Do I not hear of others who have made many more thousands in other pursuits? Shall I, then, give up bees and adopt the other pursuit? But you say, 'It takes capital in other business, and one can make a start with only a single colony of bees.' Yes, you can make a start, but you can not make a living with a single colony; and with the price of it you can also make a start in merchandise; and within a week a friend was telling me of an acquaintance in New York whose net income from merchandise the previous year was a third of a million. 'Oh, yes!' you say, 'but the merchant had years of preparation, and special talent in his line of business.'

"Now, if you think no preparation or special talent is needed to succeed with bees, you are decidedly in error. It is true, you can invest in bees to the extent of your capital, with no knowledge of the business, and so you can in merchandise, with the probability of losing in one as well as the other.

"I am quite inclined to believe that those who have been the most successful in bee culture, if they had used their ability with the same enthusiasm in any other pursuit, would not fail of success in that pursuit. In my own case, so far as financial success is concerned, I should be better off in this world's goods to-day if I had never kept bees. But, with my present views, I prefer it to any other business, because I can live in the country, be outdoors, have better health, be much of the time with my family, and do not know of any other business I like so well. There is hard work in it, in spite of all that has been said of its being nice for feeble invalids. The man who takes care of enough bees to make a living will find that he earns his bread by the sweat of his brow.

"In writing thus, my chief aim has been to show phases of the subject not generally dwelt upon."

It seems to me, friend Root, that in standing by the side of such men as the Rev. W. F. Clarke and Dr. C. C. Miller, I have not "got astray into bad company."

The next time I write I will try to say something upon the adulteration of sugar, and upon queen-excluding honey-boards.

I was much pleased to see that you credited J. W. Sturwold with \$5.00 for his excellent article on "Making Honey Sell." Such articles as *that* are a real help to bee-keepers. W. Z. HUTCHINSON.
Rogersville, Mich., Jan. 7, 1884.

Old friend, I have not changed my mind a particle since the time I wrote those kind words in regard to yourself; but it seems to me *you* have been changing. If not, I humbly beg pardon. I do not want to have you ever cease from presenting the truth in all its aspects; but I do fear to have you get into a complaining sort of spirit, or to lose your enthusiasm, which has been worth so

much to many of us. I fear we are in danger of misunderstanding each other. Let me illustrate: A good old friend and neighbor of mine came into the office a few evenings ago and made the remark, that with his 80-acre farm he had not for the past two years made a living, and yet he had worked hard all the time. Now, would this be a valuable statement for the agricultural papers? or would you think it best for him to get up and announce this fact at one of the farmers' institutes now being held all over our land? Would you advise him to discourage our young men from going into farming? or has farming ever been presented in too attractive colors to individuals of ordinary good common sense? I should consider bee-keeping one branch of farming. We have tried to teach that bee-men must succeed by earnest, hard work, just as farmers must succeed by hard work. Another thing, friend H. I have been pained by some remarks you have made, because they seemed almost like complaining of God's mercy and providence in having placed you just where you are to-day; and I think that our good friend C. C. Miller needs rebuking for his expression, "I should be better off in this world's goods to-day if I had never kept bees." How does friend Miller, or anybody else, know that this is the case? Had he inserted the word "probably," it would have been quite different. Another thing, he did not explain that he had a profession that yielded him quite a large salary before he began keeping bees. Had he kept on in his profession, he might have been worth more money than he is now, providing his health would have permitted it. He came to pay me a visit just about as he was thinking of giving up his profession, and made a remark something like this: "Mr. Root, I should be just happy if I could give up every thing but bees, and work with them all day long." At Toronto I reminded him of it, and he replied, "Brother Root, I am happy and thankful." And I am sure every one who saw him thought that his looks showed it. Now, friend H., ought not you and I to be happy and thankful too, right where we stand? and ought we not to be careful about saying or doing any thing that should give any one any reason to think to the contrary?

ACROSS THE OCEAN.

SOMETHING FROM FRIEND JONES HIMSELF IN REGARD TO MAILING QUEENS.

FRIEND ROOT:—I think friend Benton carries off the palm. He has mailed me, during the last season, many queens. Some of them were received before I heard of it about any other person. Friend Doolittle's devising a similar cage, only shows how great minds sometimes run in the same channel. See how nearly the late lamented Quinby agreed with father Langstroth on many important points. How often one invents something which, perhaps, was used by others long before! and until they have found this all out, they believe that they were the first to invent the new plan or system, whatever it may be; whereas some two or three or more before them may have discovered the idea.

I showed you, friend Root, and thousands of others, at the Toronto exhibition, the cages in which I received the queens from Benton. I also showed them at the convention in Flint, Mich., as well as to scores of visitors at my place during the summer.

Here let me say, that Mr. Benton has, during the past season, been doing business on his own account, I having previously sold my Beyrout, or Mt. Lebanon apiary, to Mr. Baldensperger, taking my pay in queens. I have now given my Cyprus apiary to Mr. Benton, so that I am entirely out of that speculation, which, by the way, was a losing one.

Mr. Benton's locating himself at Munich, in Germany, is a good thing for all the bee-keepers here, as any one wanting a choice imported queen, of almost any race, can send to him and get just what he wants. Queens coming from him are sure to be just what he recommends them to be, as he is exceedingly careful in selection, management, shipping, etc., and I hope he will receive the patronage he deserves, as he can not afford to stay there without a liberal patronage from America. And even with that, I fear his expenses will leave him very little for his labor, at the prices he is asking. The course he is pursuing is likely to test the mailing business. The mailing of queens seemed to be one of Mr. Benton's hobbies. Many hours we spent in the East, talking over the matter; but the postoffice regulations seemed always to stand in the way. Mr. Benton is very enthusiastic in the business, so that, if he does not make it a success, I shall have poor hopes of any one else succeeding.

Let me say to those sending him boxes of bees, not to send any correspondence with them, for fear they may share the same fate as mine. Let the correspondence be sent in the regular way. I received a large number of Syrian queens from Mr. Baldensperger last season. They were sent to Mr. Benton, thence to me. They were packed in boxes about 6 inches square, with two combs in each box, supplied with sugar and water, similar to that in his mailing-cages. There was a very striking difference in the loss of bees that accompanied the queens. In some of the boxes, Mr. Benton had put all fresh bees, and in others a part were fresh. I found a much larger proportion of the blacks dead than of the others, on arrival. In the boxes that had part black and part Syrian (though the Syrians came all the way from Beyrout to Munich), I found a larger proportion of the blacks dead. This will illustrate the superiority of the yellow race for shipping purposes.

I will reply to friend Doolittle's article soon, and you need not fear that we shall fall out; because if we can not agree, we will agree to disagree; but no doubt when all is known on the matter, friend Doolittle will be pleased with the result.

Benton, Ont., Jan. 18, 1884.

D. A. JONES.

Many thanks, friend Jones, for your kind letter. I am astonished to hear you say you showed me the cages that brought queens across the ocean alive. Now, either you or I am absent-minded. Are you sure it was not somebody else to whom you showed these cages? One reason why I can not think it was I, is because I was on the alert for that very thing, and I do remember asking you how Mr. Benton got queens to New York for such a very moderate price, and even single queens at that. No wonder some of us forgot something, or overlooked a few matters, with the din and hurry and bustle

of the multitude of important matters coming up constantly. It seemed as though one wanted more sense than ordinarily falls to the lot of man, and more brains than any one man can carry, to consider them all at once. However, I am very glad that queens do come across the ocean, and the fact is enough to make us thankful, without discussing very much to whom the credit belongs.

AN IMPROVEMENT SUGGESTED IN REGARD TO THE BEE-ENTRANCE GUARDS.

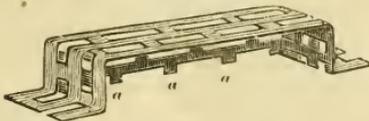

A SIMPLE MATTER, YET DOUBTLESS AN IMPORTANT ONE.

I BOUGHT of you last spring some entrance-guards for excluding drones. They worked well so far, but I have one objection against them. When a bee laden with pollen crawls through the openings, the sharp edges strip a part of the pollen from the legs. It happened that one guard was cut directly at the lower edge of the opening, and I observed that the bees crawled through the lower opening without losing any pollen. I believe if the guards could be cut differently it would be of great advantage. I wish to use this guard particularly for the purpose of keeping the queen in swarming time, as I am not always present then. It works well, if fastened to the entrance. But to make it fit for all purposes, it would be nice to have an opening in the middle, which can be shut by means of a little gate. By opening this gate over night, the bees would be able to carry dead bees and drones out of the hives. Also it would be of great advantage, as one can control the pure mating of the queens, by shutting the little gate of such hives as contain impure drones.

Not every bee-keeper can watch the swarms every time and all day long; and by aid of this instrument he can be sure that no swarm will go to the woods, but will stay till one is ready to hive it. Besides, there is another thing: It is not necessary to let the swarm out and cluster in a tree 20 feet high.

Harvard, Ill., Jan. 21, 1884. CHARLES FAUST.

The improvement will be readily understood by the cut below. In making these guards, our tinners have cut them up without any special regard to where the

openings come. Now, in cutting the sheet, if the part forming the lower edge is cut in such a way as to leave the metal as at *a, a, a*, we shall have it as our friend prefers it—that is, the bees can enter with loads of pollen, and walk right along on the bottom-board. At the same time, a drone could not get out any more than he could get through the openings. While this would control drones without any trouble, it seems to me the comparatively uneven surface of the board forming the bottom of the hive or entrance would hardly be accurate enough. If we expected the arrangement to confine queens, it seems

to me it would be better to rest on a sheet of zinc, or some other hard substance, exactly level. Friend B. also gives some very good reasons for having an opening made in this drone-guard, to be opened or closed at pleasure. Indeed, the bees would find it inconvenient to drag rubbish out of the hive at night with this obstruction in the way, while it might as well be removed at night as not. Now, instead of the little gates he suggests, I would have the drone-guard hinged at one end, and held down firmly by a button at either end. It can then be easily raised so as to give a free passage at all times and seasons, when no guard over the entrance is needed. I should dislike to have any thing over the entrance of the hives permanently, that hindered the bees from carrying out rubbish, or dislodged the pollen while going in.

MOVING BEES TO CATCH BASSWOOD BLOOM.

A LOCALITY SUGGESTED, AND AN INVITATION EXTENDED.

FRIEND ROOT:—JUVENILE is at hand, and as full of good things as an egg is of meat. I have just read R. Stehle's article on page 44 with your remarks, and the plan is so feasible to me that I pen you a few thoughts.

About 12 miles from here there is what is called the "Bee's Nest." It is a tract of timber in the valley, and on the banks of the Muskegon River, that, from good authority, literally swarms with bees. I have been there, and the timber is thickly interspersed with basswood, both in the valley and on the northern bank—making, you see, a long flow of basswood honey. From the enormous amounts that have been taken from trees, and the results of some box hives that have been kept in the vicinity, I know it to be a good place to get a good flow of basswood honey; and as soon as I feel I am the least overstocked here, I shall locate an apiary in the vicinity permanently.

Now, if Messrs. Stehle and Knowles, or other persons in the more southern latitudes, want to try the experiment, they can follow the M. S. & L. S. R. R. to Allegan, then take the Chicago & Western Michigan to Muskegon, and then about 12 miles over a sandy and easy road to the place I mention. I have friends in the vicinity, and could arrange to have teams meet the train the same day, and have them ready for work in the morning. I never knew the basswood to open here earlier than July 5, and last year it was about the 25th; but still there was no space between white clover and the basswood bloom; in fact, my bees worked on clover after basswood had ceased. If there is any thing I can do, I am at the service of the friends.

Fremont, Mich., Jan., 1884. GEO. E. HILTON.

Many thanks to you for your kind information, friend H. If the basswood timber is not all cut off for making honey-boxes, it seems to me I can look forward and almost see the time when we shall have special localities dotted all over our nation, where beekeepers with their hives "do congregate," in time for the opening bloom. They would be like the shepherds of olden time, driving their flocks to grassy localities, and I hope nothing but peace and good will may be

found among them. Only a very few seasons would be necessary to determine where the great honey-flows are located, and then after that we shall all know where to go. There is this, unfortunately, however: Basswood is no exception to the general rule of poor seasons now and then. Now, where basswood is thickest do they ever have seasons when it yields absolutely no honey? Perhaps friend Doolittle can tell us.

THE DREAD SCOURGE, FOUL BROOD.

A FRIEND IN TROUBLE.

FRIEND ROOT:—I am going to write to you for advice. From a paper published in our county, (last week's issue), I clipped the inclosed article:

At the State Bee-Keepers' Association held on the 9th of this month at Lincoln, the question of foul brood and its introduction into the apories of the State was very fully discussed and we would like right here to put every bee-keeper on his guard against this dread disease. Foul brood is epidemic, and when once introduced into an apiary it is almost sure death to every colony with which it comes in contact, and there are many ways in which the disease may be carried to every colony in the neighborhood. The disease attacks the grub when one-half or two-thirds grown, and is readily detected by the grub turning to a dark coffee-colored mass in the cell. Some diseased colonies were brought into this county from Fillmore Co. by Jos. Saylor, and sold to different parties, and we would suggest to those parties having such bees in their possession that they look after them very closely in the spring, and if they show any signs of disease the comb should be melted, and the hives, frames, and fixtures burned.

My nearest neighbor (only about one hundred yards distant) bought one of the "Jos. Saylor" colonies; and late last fall, when they were almost all dead, my bees robbed that colony. I did not know that they were at it until they had almost cleaned the combs, and I never knew until I saw the inclosed article what was the matter until my neighbor's bees. I am an A B C in the bee business. I bought one colony one year ago last April; have increased to 9 strong and 4 weak colonies. What am I to do? Can they be cured, or must I burn every thing? I am a poor man, and it will be a big loss to me if I have to burn them. How soon would it be safe to begin again on the same ground? If you have the time to spare, please write to me. Any information you can give me will be gladly received. J. O. BOGGS.

Endicott, Jefferson Co., Neb., Jan. 21, 1884.

As we have never had a case of foul brood of our own, and never saw a hive really infected with it, I do not know how to advise in the matter, but would ask friend Muth to please tell our unfortunate brother what is best to do. If the colonies are few, and he can take the time, it seems to me that, with comb fdn., he might save his bees, destroying only the combs that were badly diseased.

THE SYRIANS AND THEIR TEMPER.

ARE THEY GENTLE, OR NOT?

M. R. ROOT:—At the Northwestern Convention in Chicago last fall I seemed to be the only one who had gentle Syrian bees. Many of the members present had tried them, and all had found them cross. I have seen a number of articles on the subject since, and find that the majority pronounce the Syrians crosser than the Italians.

Now, my experience has been different. From the experience I have had with them—not very extended, it is true—I formed a high opinion of them, and

one of the best of the good points on which I based this opinion was their extreme gentleness. As I said at the convention, I have found them as gentle as the gentlest Italians, and much more so than the average. In fact, they were the most peaceable bees in my apiary, although it is almost wholly composed of three-banded Italians of several strains, ranging from the dark, leather-colored, to the very light ones.

Now the question rises, Have I pure Syrians? I got my first queen of you (a select tested one), and was informed in your notification of shipment that "Mr. Harrington considered her a very nice one."

Now, what points are considered in the selection of these queens? Do you endeavor to keep them like the original imported stock, or do you try to have "good bees," regardless of purity of race? How far is neighbor H.'s apiary from other bees? Does he breed from an imported queen?

I am very well satisfied with the bees as they are, but I want to know what to call them—whether pure Syrians or Syrio-Italians.

In conclusion, I will say that I find enough difference between them and Italians to be sure that there is at least a large share of Syrian blood in them. I consider them superior in several respects; and unless they disappoint my expectations next season, another year will find me with a full apiary of Syrians or Syrio-Italians. J. A. GREEN, 140-182.

Dayton, La Salle Co., Ill., Jan. 7, 1884.

Your queen was probably a cross between the Syrians and the Italians, friend Green. Neighbor H. has an apiary about $1\frac{1}{2}$ miles from any other bees, and rears from a queen purchased of D. A. Jones; but as his bees are a good deal mixed with Italians, the probabilities are that his queens meet Italian drones. I should say they are properly Syrio-Italians. Glad to hear a good report from you.

TESTING THE PURITY OF BEESWAX.

A TIMELY SUGGESTION FROM OUR GOOD FRIENDS
DADANT & SON.

FRIEND ROOT:—We have just hit upon a very easy plan for testing the purity of wax, and will give it to you, to be published in GLEANINGS, if it is worth publishing. Dilute water and alcohol in a vial about three-fourths water and one-fourth alcohol. Then take a small piece of wax, which you know to be pure (you or any bee-keeper can easily find such); put it in the vial, and add alcohol until the specific gravity of the mixture is the same as that of the wax. The wax will then go to the bottom very slowly. Your testing apparatus is now ready. If you have wax with tallow or paraffine, and put it in the mixture, it will remain at the top, its specific gravity being less than that of the mixture. If it contains rosin, on the other hand, it will go to the bottom quickly, being heavier than the mixture. In testing, you should take care that the sample contains no air, as this would change its specific weight. In testing foundation, therefore, the sample should be thoroughly melted before testing, so as to exclude all air from the inside of the sample.

This test is cheap and conclusive. There may be a small difference between one sample of wax and another; but it is not so as to exclude the clear dis-

covery of tallow or paraffine, which will float beautifully. We hope this will be of service to many.

CHAS. DADANT & SON.

Hamilton, Ill., Jan. 24, 1884.

I believe, friends D., you have hit upon something quite practicable. Of course, the test is only for specific gravity; but if the wax chews all right, tastes all right, and has the right specific gravity, I think we are pretty safe. I can always detect rosin by the taste, very quickly; and chewing will almost always tell the presence of either rosin or tallow, because it makes it form chewing-gum, like grafting-wax. Now, you see if they should put in rosin and tallow so as to balance each other, and thus bring the specific gravity right, we could readily get at it by the taste. The worst swindle we ever got into was some wax that was adulterated with sand; and as it was put into the bin with several other lots, we were at a loss to know where to fix the swindle. When we melted it, the sand went to the bottom of the melting-tank, so it did not hurt the fdn. any. But there was enough of it to make a pretty sad pressure on our pocket-book.

HOLY-LANDS CROSSED WITH ITALIANS

SOME VALUABLE FACTS FROM PRACTICAL EXPERIENCE.

MUCH has been said for and against the Holy-Lands; but as mine are a cross between Holy-Lands and Italians, I will give you their good and bad qualities, as has been my experience with them the past season. They build up better in the spring, and with fewer bees, than the Italians; they keep the combs well filled with brood at the commencement of the honey season, which is very important; they commence working in the sections sooner than the Italians. This is probably due to their having the combs filled with brood to the top-bar. They build nicer and straighter combs than the Italians, and are not so particular about crowding every little space full of comb. This I have especially noticed in sections, if they are not filled full of foundation. They will often round off the edges of the comb, and scarcely fasten them to the sections at all, except at the top, especially when honey is not coming in fast, thus making them unsafe for rough handling; but by filling the sections complete with fdn., this may be overcome. They do not bridge their combs together, and attach pieces of comb between the lower and upper story, as do the Italians. I have had colonies that put scarcely any comb or glue between the lower and upper frames, and you could lift them out as nicely as you please; while some Italians would have them bridged together so that you would have to pry loose every frame. They can not be controlled so well in swarming-time as the Italians, although I do not think they are as liable to swarm as the Italians; but it is next to impossible to cut out all the queen-cells after they have swarmed, and the young queens are so vigorous that it is unsafe to throw these cells around carelessly; for if nearly ready to hatch, they will often gnaw out and crawl into other hives; and as these young queens are often accepted, might not this be the way some strange "queen cases" appear? I have thrown them on the grass, and had them hatch and crawl into a hive.

SEPARATORS, ETC.

As there are still some who claim that wooden separators are superior to tin, I will give my experience. I find that separators made of wood are not what I want. First, they will warp and become crooked, and can not be fastened as securely as tin. Second, they are liable to split and break when pried apart. Third, the bees will attach propolis and comb to them when they will not to tin. I have used both kinds on the same hive, and find they work just as quickly in the tin as wooden ones. If you have them where the mice can get at them, they will gnaw them up badly. In regard to dispensing with them entirely, I do not believe it is a success in securing nice comb honey, unless in some different way from the ordinary one in securing comb honey. It might do not to use any, by having narrow sections filled with foundation, and having the bees commence in all of them at one time. Even then I do not think they could be taken out as fast as filled, and replaced with empty ones, so as to secure straight combs; and by carrying some partly filled to colonies that refuse to start in the sections, you would almost be sure to get thick and thin combs.

FERTILE WORKERS AMONG THE HOLY-LANDS.

If you happen to cut out all the queen-cells, and leave them without material to rear one, you will in a short time have fertile workers. I will tell you a case of this kind which occurred to me last summer:

I made it a rule last summer to cut out queen-cells, to prevent after-swarming; but one colony, in some way, was left without cells or material to rear a queen. When it was time to examine those colonies which had cast a swarm, to see if the young queen was fertilized, I found eggs in several combs, and queen-cells started, which contained eggs. I looked for the queen, but could not find any, yet I was quite sure they had one, for there was nothing unnatural, except those queen-cells; and as these are of frequent occurrence during the swarming, I was yet not sure that they were queenless, for there were plenty of eggs in the combs; and in due time those queen-cells were capped over, and looked like any other natural cells. But a queen failed to hatch, and those eggs in the worker cells hatched out nothing but drones. Then I was sure that fertile workers did the mischief, and the next thing in order was to get rid of these pests. I tried introducing queens, but it was of no use. I moved the hive away, and let the bees return, but this would not work. Finally robbers began their mischief on this colony, and the best thing I could do was to give them combs of brood and a queen from another colony, and close the hive for a short time, to keep out robbers. This ended the mischief, and in a short time it was a prosperous colony.

You say, in the A B C book, that the eggs of a fertile worker are scattered around in the cells, sometimes several in one cell, and that they sometimes build queen-cells, over this drone larva; but I think this was an exception to the rule, for the eggs, I think, were deposited in the queen-cells, although some contained several eggs, and were of different sizes; and the eggs which were deposited in the worker-cells were not scattered around promiscuously, some in worker and some in drone cells, but were deposited just about as a queen would.

The Holy-Lands crossed with Italians are some crosser than the pure Italians, depending on the amount of Holy-Land blood.

H. J. SCHROCK.
Goshen, Ind., Jan. 25, 1884.

MORE ABOUT THE BAKER BEES.

ALSO SOME GENERAL REMARKS RELATIVE TO A STRAIN OF BEES THAT WILL STAND OUR WINTERS WITHOUT SPECIAL PROTECTION.

[See pages 741, Dec. 1, and 18, Jan. 1.]

FRIEND ROOT:—During the past summer I have been gathering up some bees, preparatory to making a specialty of apiculture, and, of course, I wanted some Italians, so that I could Italianize what I already had. Well, I was recommended to a Mr. Baker as a bee-keeper who had pure Italians, and I went there and found them as represented, and I purchased a choice colony of him, and afterward removed them home. Well, when Mr. Robbins' article came out in December number of GLEANINGS, of course, was deeply interested, and resolved to investigate the matter for myself.

I put the matter off until I received the January number of GLEANINGS also, and in that a second article from Mr. Robbins. But yesterday I took both numbers of GLEANINGS referred to above, and drove over to Mr. Baker's, a distance of about 12 miles, and now I will give the result of my investigation.

Mr. Baker did go west from VanBuren, as stated in Mr. Robbins' article, but not with the intention of staying there permanently, and has since returned. When he went west he did not sell his bees, but left them in care of his brother. After he had been in the West some time he wrote to his brother to sell the bees, all but 4 or 5 of the best stocks, and his brother put them up at a sale, and sold them as directed; and Mr. Baird, instead of getting the bees direct from the owner, got them at this sale. Mr. Baker says he is acquainted with all the parties mentioned in Mr. Robbins' article, and is fully satisfied the bees mentioned are of his particular strain.

WHAT MR. BAKER HAS TO SAY ABOUT THEM.

Well, he has never lost any bees yet in wintering, except one, and that one the combs broke down, and when a warm day came they swarmed out and left. He has noticed that his bees, when flying in and out, go very rapidly—some stocks more so than others. His bees are not as bright as some he has seen; but when the queens are purely mated, the three bands of yellow are well defined (all queens not so mated he destroyed); the queens are rather dark. As to their having a waspish appearance, he had nothing to say, nor did I ever notice it, but will observe in regard to that when warm weather comes.

He claims they are very prolific. As to their honey-gathering qualities, I will try to tell that in a few words. I want to say about Mr. Baker personally, that he has never read a standard work on apiculture. All he knows about bees he claims to have learned by actual experience. He owns a farm, and attends to his bees in the few spare moments he can snatch from his farm work. He has one queen that produces now and then a bee not marked as a pure Italian; the remainder, between 20 and 30 stocks, are all marked as pure Italians, and this with an apiary of badly hybridized bees within about 60 rods of him, containing about 75 colonies. As Mr. Baker never read any of the bee publications, of course he knew nothing in regard to modern applications for obtaining surplus honey, and he has worked more for increase, as he could always sell stocks of bees to a good advantage. He never worked so much for surplus; but after all, the return from this source was satisfactory. He says he

does not fear the wintering problem. He is feeding one colony now that was robbed in the fall; has fed them every day this winter. He simply raises the cover, and pours some syrup down over them. He showed me these bees yesterday, and they were lively, bright, and healthy. They starved, as do all the rest of his bees, unprotected on their summer stands, except a kind of shed over them.

Stanley, Ohio, Jan. 15, 1884.

JACOB GUISINGER.

I have given the above, principally that we may get a fair view of the case, and I trust the friends who have written in regard to these bees will not get into any controversy in the matter. While I am pretty well satisfied that an apiary of bees where spring dwindling has never been known is less liable to be affected that way, I can hardly believe this apiary of 20 or 30 colonies has any special merit in the direction mentioned, over Italians slightly mixed with common bees in general. It is not very unusual to find whole apiaries that winter safely, winter after winter, and that without very much care. The principal point before us is this: These bees were never bred with any special object in view. Whatever remarkable trait they may possess came about accidentally. Other bees—blacks and hybrids—are round about in the neighborhood, and thus crossed and re-crossed, as bees usually are. If there were one or two colonies found in the apiary having remarkable powers of endurance, it would be nothing very remarkable; but it seems to me it would be very remarkable indeed that the whole of them should be greatly superior to bees in the vicinity, or, if you choose, to bees in general. I know I hurt a good many people's feelings by the cautious way in which I advise acting in regard to these new things that come up; but a great and growing class of learners are depending upon me a good deal for advice; and while I am sorry to discourage or throw cold water on any new project, still I feel it would be a serious thing for me to let any individual interest stand in the way of guiding these young friends safely and wisely.

A VISIT TO SOME OF THE CONVENTIONS IN THE SOUTH.

ALSO MENTION OF SOME OF OUR PROMINENT SOUTHERN BEE-MEN.

I STARTED with 13 colonies; increased to 30 by artificial swarming; but lost nearly all the white-clover blossom by dividing at the wrong time; secured about 300 lbs. extracted honey from heart's-ease. Buckwheat was a failure this season. We did not get a drop of rain from Aug. 15 to Oct. 1. The bees worked on the leaves of the oak during September, early in the morning; but what they got from leaves I could not say. I was not so fortunate as you and friend Cork, of Niagara, to have a ladder to get up the tree.

Taking the season all together, it was not up to the average. I visited Louisville last August to attend the exposition and the Kentucky Bee-Keepers' Convention. While there I met friend Hart, who gave quite a description of Florida and her honey resources. He was listened to very attentively by all the bee-keepers, as a great many of them are

thinking about moving there. Friend Muth gave an account of his experience in handling honey, and gave some valuable points to bee-keepers. The bee-keepers of Kentucky gave the visiting bee-men a cordial reception, and made things pleasant for them during their short stay. They had a very nice display of honey and bees, and friend Wilson had a nice display of Italian queens. The managers were lacking in one thing, and that was the small amount of honey they had on exhibition. As friend Muth remarked, they should have had a stack of honey as high as the ceiling.

I went from Louisville to Cincinnati, and called on friend Muth. He was not at home, but one of his clerks showed me his store and bees, and then fetched me down in his cellar, and there I saw honey—barrels of it piled four tiers high. I came to the conclusion that friend Muth does a very large business in extracted honey, and has a large supply of hives and apiarian implements.

Bee-keeping is making great headway around here. We had a fine display of bees, honey, and apiarian implements at our annual St. Louis Fair. There were six bee-keepers represented this year, whereas at the fair previous there were but two. Friend Flanagan had a grand display of bees, honey, and apiarian implements, and took first premium for the best display of apiarian implements. Messrs. Buck & Swallow had a very nice display also, and took first premium for the best honey-knife. It is a model knife, and serves both for cutting and uncapping. It is their own make. They took second premium for apiarian implements. Friend Little took first premium for best display of Italian bees.

RICHARD GRINSELL.

Baden, Mo., Jan. 16, 1884.

The "Browlery."

This department is to be kept for the benefit of those who are dissatisfied; and when anything is amiss, I hope you will "talk right out." As a rule, we will omit names and addresses, to avoid being too personal.

A. I. ROOT:—On the 18th of December I received a postal from you, in which you said, "We send you catalogue and price list, etc." I suppose you meant to say, "We will send when it suits our convenience," and from past experience I have found it requires a good deal of patience to wait your time. If you have sent me one I have not received it; and if it suits your convenience, and you see proper, you may send me one.

JOHN H. WOMELSDORF.

Huntingdon, Pa., Jan. 14, 1884.

Now, friend W., that is rather rough on a body. We have not only been laboring to get up that price list, but we have been laboring to find people like yourself who want them; and I have also been laboring with our clerks to say, in writing to a customer, "We have sent you a price list." And then I have labored with them again on the importance of being always truthful; do not, under any circumstances, tell anybody you have done a thing when you simply mean you are going to do it. If you let yourselves get into a way of taking even that little liberty in speech, you will soon get to telling downright lies. I should not like to say right here, before present company, that I

know by experience; but I will say this: I do know of business firms who used to say goods were sent, only to pacify customers, when they meant they were going to send them the very next thing. Do you know what became of them; they soon failed in business, and I know of no exception to this rule. Our clerks are doing better, friend W., and I do not believe you will ever have any more such experience.

While I am about it, friends, there is another thing I want to talk about. The trade in the A B C books has got to be a pretty big business, and a great many people hear of the book, and send for it without stating definitely whether they want a cloth-covered book, price \$1.25, by mail, or only a paper-covered book, price \$1 00, by mail. It is true, we can generally guess by the amount of money; but sometimes, or, in fact, quite often; the order comes with money for other goods, and our friend does not mention the price at all. Which should we send him? If we send a paper cover, he often gets offended, and sends it back, saying, "Mr. Root, you ought to have known I did not want an expensive book like that in paper covers, to get dog's-eared and torn up in a little while." If we sent cloth, the beauty of the cover and binding generally makes them satisfied, even if they did mean to have a cheaper one. But there are exceptions even to this, as the following will show:

Mr. Root:—Your card calling for 25 cents due on A B C is at hand; and in reply I will say that I sent you one dollar for the book, and it seemed to me then, and does yet, that it required but little "horse sense" to know that I would not ask for credit, and only wanted my money's worth, and this is especially the case as you had the book for that price. Send me a dollar A B C, and 15 cents for return postage, and I will return the A B C I first received.

New Richmond, Wis., Jan. 10. F. N. BLACKMAN.

Now you see, friends, just one little word in ordering would make it all plain and pleasant. When you order an A B C book just say cloth or paper, as the case may be.

Here is another friend who got offended in some way. And, by the way, he makes the first complaint about the A B C book that I think I ever got; that is, the first one who said he was disappointed in the book. We have had thousands of commendations, but only one that I know of the other way.

I thought the amount I sent was sufficient indication of the style of book I wanted. I don't want to invest any more in it. You can make the exchange if you desire it, or send back the money, and I'll send you the book, or let it stand as it is, just as you choose. I am disappointed in the book. It seems to be mainly advertisements of Mr. So-and-So's planer, Mr. So-and-So's honey-pail, and Mr. Somebody's something else.

INSLEE DEADERICK.

Louisville, Tenn., Dec. 31, 1883.

To be sure, friend D., the A B C book tells about other folks' things. You didn't suppose I was smart enough to make every thing, or tell how to do it, that pertains to bee culture, did you? Almost everybody who buys the A B C book wants to know where he can get the things mentioned therein; therefore I tell about Mr. So-

and-So's planer, and Mr. T'other man's honey-pail, because he got up a better one than I did. And then, again, I tell about Mr. Somebody's something else, because I thought it was a good thing, and you would like to know about it.

MORE ABOUT "THE OTHER SIDE."

FRIEND ROOT:--While I entertain the highest respect for your correspondents in general, and W. Z. H. in particular, I can not quite agree with what he says in GLEANINGS, page 5, about bees being kept only by those making it a specialty. I am well aware, however, that those who devote their whole time and attention to the business are most likely to attain to the highest success. But suppose we who have families depending on our daily effort, having given it our whole attention, should fail in some seasons—like the past, in many localities, for instance. All bee-keepers can not make money at queen-rearing, for there would be no customers. Neither have all of us the ability to gain a living with the pen. I know it may be said that no person should make a specialty of any thing, especially bee-keeping, until he has tested his ability to master all its difficulties, and knows that he can succeed. But I question if bee culture is not, all things considered, more precarious than other rural pursuits; and for this reason, if none other, is it not desirable to combine it with some other occupation?

Friend Hutchinson says: "The farmer was not long in discovering that he could buy his honey more cheaply than he could produce it; and, like a sensible man, he dropped bee-keeping." Now, my own experience in bee-keeping in connection with farming, and my acquaintance with others who have had fair success in the two pursuits, leads me to entertain a directly contrary opinion; and I shall have to own that some of us, at least, have yet to make this discovery. And in this section the number of farmers that buy honey to use on their tables is so few as to be hardly worth mentioning. Of course, the two pursuits will need our attention at the same time, and we will sometimes feel as if we ought to be in two places at once; but if we are up and doing, getting every thing ready for both farm and apiary, that can be done beforehand, during the leisure of winter, we may, by thorough and intelligent culture, not only be sure of the substantial products of the farm for our daily sustenance, but also the luxuries of the garden, apiary (and poultry-yard); and in favorable localities and seasons, a fair surplus from each, depending, of course, upon the amount of energy we each possess, to take to market.

Of course, if every farmer kept bees, the country would soon be overstocked; and it is equally true, that if the bees now kept by specialists were spread more generally among the farmers, the danger from this cause would be much less. Besides, the undisputed facilities which small farms afford for successful bee culture, and the benefits arising from the foundation of the various flocks by the industrious workers, are not to be overlooked in this connection. Neither should farmers, those true lovers of nature, be deprived of the pleasure which bee-keeping affords; the drawing nearer, through a knowledge of its mysteries, to that Creator who

made all for one harmonious whole, and each for the other's good.

L. M. ROGERS.

Oreida Valley, N. Y.

ANOTHER REPORT FROM THE PERFORATED ZINC HONEY-BOARDS.

KEEPING THE QUEEN DOWN STAIRS, AND GETTING ALL THE BEES UP STAIRS; A SUCCESS.

I USED the perforated zinc on 28 hives run for extracted honey; most of these were very strong colonies, and were tiered up three stories high in Simplicity hives. In some I confined the queen to the lower hive, while in other hives I gave her the range of two stories. In only two cases I failed to keep the queen below, and in one of these I found the fault to be in the way I had arranged the sheet, and not in the sheet itself; in the other I am not sure how the queen got above. In both cases she did not get back until I shook the bees off the combs and let her run in at the entrance. I kept good prolific queens in one story, with the hive full of bees from below to the third story. At the same time I had brood in all three stories when the zinc sheets were not used.

In an apiary, run for extracted honey, they may not be desirable. On this point I am not decided. If you wish to get below to cut out cells, get brood, etc., you have the sheet to remove and replace, which is some bother. It gets kinked some, and there are a few little pieces of wax to scrape off before it lies down smoothly on the frames. I got them to keep the queen out of the combs until they could be drawn out the desired thickness, and have the satisfaction of fairly beating them. But still I am inclined to think it would be as well to give the queen a free range—have all frames filled with worker comb just a little thicker than the frame, for convenience in uncapping. Your combs below will have no honey in them, as the queen completely monopolizes them, and the honey is shoved up stairs. This will suit those who wish to feed their bees on sugar, to take the place of natural stores. It takes but a moment for the workers to pass through the openings in the sheet, so I see no objection to its use, except its cost, and the time required to remove and replace, in order to get at the brood when you wish to.

J. B. COLTON.

Waverly, Iowa, Jan., 1884.

Many thanks, friend C., for your report. I am especially glad to get it, because I felt a little bad after having sold as many as we have, to see such unfavorable reports in regard to them as we have had once or twice of late. We shall have machinery arranged so as to perforate the zinc ourselves, and this will very materially reduce the cost. In regard to trouble in removing, is it more than to remove any kind of honey-boards? I presume that rubbing the sheets with a cloth dipped in some kind of nice oil that would not be offensive to the bees would very materially lessen the building of comb on them by the bees. Perhaps our finest sewing-machine oil might answer well. If we could reduce the chance to about the same it is of their building on enamel sheets, it would be quite a gain; and besides, if they did build, the wax would slip off with very little urging.

NEW THEORIES.

HAVE BEES THE POWER OF CHANGING THE WORKER EGG SO THAT IT WILL PRODUCE A DRONE?

PROPOSITION IX., Dzierzon Theory: "All eggs germinated in the ovary of the queen develop as males, unless impregnated by the male sperm while passing the mouth of the seminal sac, or spermatheca, when descending the oviduct. If they be thus impregnated in their downward passage (which impregnation the queen can effect or omit at pleasure), they develop as females." When this theory was first promulgated by the venerable father, it no doubt seemed as ridiculous as the theory I shall soon notice, and could not at first be believed; but time has shown this great bee-master was getting at the facts as they really existed, and you will find many bee-keepers now who deny the facts set forth in father Dzierzon's propositions, so beautifully demonstrated by the arguments of the Baron of Berlepsch. I would state the proposition thus: "All eggs germinated in the ovary of the queen are coated over with a thin mucous substance, which receives the impregnating male sperm while passing the mouth of the seminal sac, or spermatheca, when descending the oviduct, and said male sperm can be removed by the nurse bees after the eggs are deposited in the worker cells, and the sex of the egg changed." What! do you intend to throw aside all established theories promulgated by Huber, Dzierzon, Profs. Von Siebold and Leuckert, Baron of Berlepsch, and a host of learned bee-masters of the Old and New World? No, my friends; I do not doubt one syllable of what these learned scientific bee-masters set forth, but only wish to carry their researches a little further, if you please, making new discoveries in older fields. What if I state that bees can change the sex of eggs at pleasure? Such is the case, and I think I can truthfully assert it to be true—as much so as a drone is the "son of his mamma." Understand me, friends, that a drone egg (that is, an unfertilized egg) will produce a drone (male) always, and can not be changed by the nurse bees, it matters not how much extra tinkering they may do; but on the other hand, it is a simple operation for them to remove the male sperm from the worker egg just after the egg is laid, or just before the egg hatches. I claim, brother bee-keepers, that if the egg is impregnated as it passes the mouth of the seminal sac when descending the oviduct, as father Dzierzon asserts, the male sperm is compelled to lodge in this mucous covering of the egg, and can be removed by the bees when the welfare of the colony demands it.

Now for the facts in the case. I suspected this was the case in 1879, but was not positive about it until 1882, and this year. To test the matter thoroughly, last August I took two new worker combs built out on Given foundation in wired frames, and inserted them in the center of my Holy-Land colony, containing one of D. A. Jones's best queens, and placed a Mason $\frac{1}{2}$ -gal. fruit-jar feeder filled with syrup immediately over the frames, to get the bees to cluster on them. Four days after I took them out and found them about half filled with eggs, equally on each side. I cut a hole about one inch in diameter near the center of the eggs in one of the combs. In the other comb near the center, I scraped off a dozen or more cells to the base, or fdu., and I put these combs in a strong queenless colony that had no laying queen for two weeks, and the virgin queen removed three days beforehand. I examined these

combs every day until the brood was all capped around the hole; eight queen-cells were drawn out, and all hatched nice queens; and near these cells a dozen or more (I did not count them) cells drawn out for drones, from which I saw drones hatch. On comb No. 2, not a single drone-cell, and on the comb containing the queen-cells, the drone brood was on the same side of the comb on which were the queen-cells, while the other side showed solid worker brood. I tried this experiment last year twice; and several times this year, and I invariably find some drone-cells near the queen-cells; and to be certain, I tried the experiment in a hive where there were drones, and the result was all worker brood, which proved to my mind that bees have the power to change the sex of eggs when the welfare of the colony demands it. It was hardly possible that the bees removed the eggs of the worker bee and deposited one in its place, for there was only two days' difference in the capping of the drone and worker cells.

I could mention several writers to GLEANINGS, the *A. B. J.*, and other bee-journals, who have surmised the same thing, but I do not know how far they carried their experiments.

In conclusion, let me introduce two propositions, and I invite all bee-keepers to watch closely and see if I am not right.

1. Bees change the sex (female to male only) of eggs, whenever the economy of the colony requires it.

2. Laying workers are found in nearly all colonies; hence, a colony with a pure mated queen will contain hybrid drones. B. F. CARROLL.

Dresden, Tex., Nov. 24, 1883.

Friend C., you may be correct in your surmises. I confess, that from the experiments I have made, and those given by others, it looks quite probable. But your proposition, that laying workers are found in nearly all colonies, I should not agree to. For some time you have been working mostly with Cyprians and Holy-Land bees, if I am correct; and it may be that laying workers are found in nearly all colonies of the above races; but I never saw a laying worker in any colony containing a laying queen, until I saw these new races. If you mean that there are bees in nearly every colony containing workers that may become laying workers, then I agree with you. I do not think we are in very much danger, however, of having our bees hybridized by drones produced by laying workers.

WHY BEE KEEPING DOESN'T PAY.

ALSO SOMETHING ABOUT HYBRIDS VS. ITALIANS.

IBEGAN about six years ago, not knowing any thing about bees. I managed after the old way, or it was, rather, letting the bees manage for themselves; at any rate, at the end of about two years they all came up missing. People said bees didn't pay any more; they did no good, and it was no use to bother with them. But I wasn't satisfied; and having seen your advertisement in a newspaper about bees, I sent for your price list, and then I sent for your A B C, and I began to see why bee-keeping didn't pay. I saw that we were away back in the past, and almost lost in the mist of old-fogyism and superstition; and by studying A B C, and

reading GLEANINGS, I soon passed by old-fogylism and superstition, and I am now slowly ascending toward the hill-tops of scientific bee-keeping.

After studying A B C, I began anew, by buying some bees of a box-hive bee-keeper, and transferred to movable-frame hives in the season of 1881. My bees did well, making nearly 100 lbs. per colony in section boxes, which amount was thought almost incredible by the old-fashioned bee-keepers. In 1882 I concluded to Italianize, and bought several queens of you, which I introduced safely, and now for results. The year 1883 having arrived, and my bees were mostly Italians, I now had a good chance to try their superior qualities; and getting my section boxes all in readiness, I put them on in good time. I waited results, and I kept looking to see them go to work; they seemed to pay no attention whatever to the section boxes, yet my common, or German bees, were at work drawing out the fdn., and doing very well; and the Italians, though booming with bees, were paying no attention to the surplus department. I concluded to look and see what all this meant; and looking over the brood-frames, here was queen-cell after queen-cell; they were making great preparations to swarm, just as though they had every section box full, and were crowded for room. They would scarcely look up toward the sections.

I concluded to stop their fun, and cut out every appearance of a queen-cell, and, behold! the next day they swarmed and left one hastily prepared queen-cell; but I was determined they should stay in the hive, whether they would work or not. I took the queen from them, and kept them from swarming; but they would not work in the sections, and thus it was with all of them. I had one very weak colony of the common bees that made more comb honey than any three of the strong Italian colonies I had. I think a cross between the Italians and Germans is best for all purposes. I sent to Frank Benton last fall, and got a Carniolan queen, and will give it a trial next season. I am also going to get some of Jar. Heddon.

W. S. VANDRUFF.

Kirby, Greene, Co., Pa., Jan. 9, 1884.

Friend V., is it not possible why you had better success with the hybrids than with the Italians is somewhat owing to your inexperience with the latter? I rather think that an old hand at the business would have made your Italians store honey in sections, and stop fooling away their time in trying to swarm.—We should be very glad indeed of a report from your Carniolan queen.

SEPARATORS OR NO SEPARATORS.

FRIEND C. C. MILLER ALSO TELLS US SOMETHING ABOUT THE DIFFERENT KINDS OF SUPERS.

I TRIED several thousand sections last summer in Heddon supers, and, of course, without separators. Although I have not entirely settled all about separators, I think I have learned something. If I did not want to ship to a distant market, I should never use separators. At the Northwestern convention at Chicago, a large number said they succeeded without separators; but I suspect the most of them worked only for a home market. I tried some wooden separators. They are cheaper than tin, and it may be the bees like them better than tin; but the ones I used warped so as to make them objectionable. My experience leads me

to the conclusion that a strong colony will make straighter work without separators than a weak one; also, that during a full flow of the honey-harvest, separators are less needed than when honey is coming in slowly.

HEDDON SUPERS.

In some respects I like the Heddon supers very much. They are so much lighter to handle than the wide-frame supers, being only half the weight, whether full or empty. Then I can so easily and quickly look at either the upper or lower part of the super, and see the condition of the entire lot of sections, this being made much easier by the $\frac{1}{2}$ -inch space between the tops and bottoms of the sections. On the other hand, the wide frames have closed top-bars, and I can tell nothing about the sections without lifting out the frame; and if I happen to want to look at the frame on the south side of the super, I must lift out, or move, six other frames before I come to the south one. True, the wide frames might be made open at the top; but they are not; and even then, we could not see the sections in the lower part of the frames. In filling up the supers, Emma thinks it is much nicer to put the sections directly into the supers, and done with it, than to fill the wide frame in the super. Another advantage of the Heddon supers over the wide frames is, that in giving additional room it is not often desirable to give the entire room of a 50-lb. super, and the Heddon super is only half that size. Again, it is often the case, that the upper half of a wide frame is finished, and the lower half partly uncapped. No separators can be used with the Heddon super, unless a separator is used for each separate section. Mr. Burrill, of Michigan, talked of trying such separators, but I don't know whether he ever tried them. When it comes to taking out sections, Mr. Heddon claims a great advantage in rapidity for his super. My experience does not agree with his. My boy, Charlie, takes out, at his best, 900 sections per hour from the wide frames. I don't know that I can take any thing like half that number from the Heddon supers, and I damage more sections in getting out of the Heddon supers. However, practice might make a great difference in this respect. A point in favor of the Heddon supers is, that sections of different widths can be used in them. The width of the wide frame makes an invariable width for the section. In the Heddon supers, during the past season I used sections measuring in width $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, and 1-5 inches. When the sections came to be packed in the shipping-cases, those from the wide frames packed, oh so much nicer and easier! But I think I could do better another year in getting straight sections without separators.

To those who have been successful in using separators, and contemplate throwing them all away without any previous experience without them, my advice is: *don't*. Try a few first, and feel your way along. People are not all alike. I think it quite possible some may do best always to use separators. Mr. Heddon, Mr. J. B. Hall, and others, have proved that they can do without them. I don't know yet in which class I belong.

C. C. MILLER, 172-251.

Marengo, McHenry Co., Ill., Jan. 14, 1884.

Many thanks, friend Miller, for your article on this subject that is now calling forth so much anxious thought. It occupied a very prominent part of the discussions of the convention at Columbus; but I believe the general decision was much like your

own. Those who carry their honey to market in a spring wagon, can, without much trouble, dispense with separators; also, it is pretty well decided there is much less difficulty in getting straight nice combs where the sections are not more than $1\frac{1}{2}$ or $1\frac{3}{4}$ inches wide. Quite a number are talking about using separators, one to each section; but I think they won't do it very long, if they give it a trial.

OHIO BEE-KEEPERS' CONVENTION.

HELD AT COLUMBUS, JANUARY 14, 15, AND 16.

I WAS present at the convention only one day, January 15th. Before telling you what I saw and heard there, I want to say a word about holding conventions in general. This one was held in the Farmer's Hotel. The proprietors were very pleasant and courteous, and the bill of fare was good, and the prices very moderate; but I experienced a feeling of pain the moment I set foot in their doors, on finding a large display of liquors, the most prominent object in what would have otherwise been a very pretty office. The room was one cloud of smoke, and many of our bee-keepers contributed toward keeping said cloud a dense one; but I could get along very well with this, if it were not for the liquors. I do not know how many of our bee-keepers drink. Only one of them told me he had had several drinks of whisky. This one came there with his son, an exceedingly bright and intelligent young man, and I am pretty certain he would not have drank the whisky had it not been held in a building containing a whisky-shop, for he said he voted for the second amendment. I know why it is more convenient to have an association to meet at a hotel. We usually get the use of the hall free, besides reduced rates, where so many put up at one place, and sometimes it seems quite inconvenient to get a suitable hall, unless we take one belonging to a hotel or drinking-place, if this is the proper term. A great many of the conventions I have attended in our own and other States have been held in halls belonging to liquor dealers; and most hotels where I put up had a display of liquors, or a liquor-room. It may be there are no first-class hotels that don't have any such attachments. If so, it is a sad fact. If our juveniles are to attend conventions, I feel like protesting against taking them where they will see men, and crowds of them too, pour down liquors at all hours of the day. Is there no one among you who feels as I do about it? Suppose it does cost more money; can we not profitably furnish the money?

SIZE OF SECTIONS.

The first subject discussed in the morning was the size of the section. After considerable talk on the subject a vote was taken, and by far the largest part were in favor of sections holding a single pound of honey, although a few preferred larger ones. The matter of separators and the narrower section was then discussed at length, and the majority seemed to favor a section made $1\frac{1}{2}$ in. wide, or a little more, to be used without a separator. If made $1\frac{3}{4}$ inches wide it will

hold about the same without separators that the $1\frac{1}{2}$ in. section would with separators; therefore the standard for the 1-lb. section will probably be $4\frac{1}{2} \times 4\frac{1}{2}$ as heretofore.

BEE-KEEPING FOR WOMEN.

Mrs. Jennie Culp made the best report of any one at the convention this year, as she did last. She also brought samples of her honey, one and two years old, which she sells in Columbus at 16 cents per lb. I thought the price a pretty good one; but when I came to taste it I found it equal to any honey I ever saw at any price, and was not so much surprised. She sells it in Mason's jars, quart and half gallon. As we expect soon to give a drawing of her pretty apiary in connection with a report of her work I will not take more space here than to speak of it.

PROF. LAZENBY,

Of the Ohio State University, gave us a splendid talk on the "Nature, quality, and usefulness of nectar for the purpose of plant fertilization." After this paper was read, Prof. L. answered questions for us for some little time, much to our profit and edification.

PERFORATED ZINC HONEY-BOARDS.

These restrain drones without any trouble, but do not always restrain queens.

MR. T. J. MARTIN,

Of Tiffin, read an excellent paper on the management of bees, which had been prepared to be delivered at farmers' institutes held throughout the States. Mr. Martin is an exceedingly able man, and a talk like his to the young farmers of our State must result in much benefit, even to those who might not take up bee-keeping.

KEEPING DOWN GRASS AND WEEDS IN THE APIARY.

Mr. Fradenburg preferred the English rabbit. They have to be kept in by a slight fence of some kind, but will eat every kind of weed that grows. Some use sheep in the same way.

TO PREVENT THE ADULTERATION OF HONEY.

Let every bee-keeper put his name on every package he sells; and if that name is not a good, straight, honest name, go to work and make it so, the first thing you do.

Quite a good-sized table was well filled with samples of honey and bee-supplies. Our good friend Henry Drum brought a case made to hold sections of different sizes and different widths, and so made to be easily adjusted to any width the market demands.

S. D. Riegel brought samples of honey and an improved Bingham honey-knife, and a pair of wooden tongs to shut down the tin-foil caps quicker and neater than the strap used by friend Muth. The honey-knife was like the Bingham, only the blade was shorter and the handle longer.

Mr. Fradenburg had a sample of an atmospheric bee-feeder that could be filled without taking it off the hive.

Samples of different bee-journals and bee-books were also on exhibition.

The next meeting of the convention will be at the time of the State Fair. Like the

bee-men in Michigan, our Ohio people have a building on the fair-grounds for the display of bees and honey; but such a crop of honey as ordinary bee-men ought to produce nowadays, would entirely fill the building, leaving no room for his neighbors to make a display. The matter of enlargement is already being discussed.

The president of the convention, Dr. H. Besse, of Delaware, O., is not only a successful honey-raiser, but a very pleasant and able man as well, and much of the interest of the convention was due to his remarks and suggestions. The thanks of our bee-people are also due to our secretary, Mr. Hazard, who was constantly at work for the interests of the bee-men.

I am sorry that our Ohio conventions are not nearly as well attended as those I have been present at in the State of Michigan. During the day I was in Columbus there were present perhaps 40 or 50 bee men and women, and this is all from our broad State of Ohio. It seems to me our State meetings ought to get an audience of at least one or two hundred, and may be the fault lies on my own shoulders. If so, I am going to try to do better. Let us remember the State fair, and turn out *en masse*. Go from a sense of duty that you owe your State and your fellow-men, if you can not scrape up energy enough to go for any other reason. While I think of it, the thanks of the bee-keepers are due to our good friend S. D. Riegel for his excellent revision of the premium list, for the awards at the next State fair. We have about 742 subscribers in the State of Ohio, and it seems to me at least a half of these ought to attend the State convention.

HUBER'S WORKS.

AND SOME MORE INTERESTING FACTS ABOUT WRITERS ON BEE CULTURE.

ADITOR GLEANINGS:—You ask for more information about Huber's works. Strange to say, you will look in vain in our great works on Bibliography for a list of them. The works of dry polemical writers you will find described with ample detail: Huber is dismissed in a line.

His writings were all in French, and consisted chiefly of letters to his friend and scientific patron, Bonnet, some of whose replies are also given in the published volumes. Indeed, his first book bore the title, *Lettres à Ch. Bonnet*, and were published in 1792. Another volume was published in 1796, under the title, *Nouvelles Observations sur les Abeilles*. His works have passed through several editions. My copy is the second edition, published at Paris and Geneva in 1814, the second volume being edited by his son Pierre, who tells us that he procured several hives similar to those used by his father, and that "it was not without a lively joy that he in his turn became a witness to all the features of these wonderfully industrious insects."

So far as I can gather, the first English edition was published in London in 1808. You will notice that this was before the issue of the edition so carefully edited by the son. The edition named by Mr. Henderson is dated 1841. I am informed that the best edition in English is one published in Scotland.

I think, however, that there is little doubt but that Mr. Langstroth is mistaken in supposing that there is but one translation. While the translation of 1808 would exclude another for the time being, it would hardly be reprinted after a new and corrected French edition had been issued. I regret to say, that some vandal has cut out the plates from my copy. I have the promise of a perfect one, however.

As regards old books on bee-keeping, the list numbers, I believe, over 800 distinct works, including such books as Swammerdam, which, though classic on some points connected with bees, is not exactly devoted to bee-keeping.

The oldest English work that I know of is "Hill's Instruction of Bees," published in 1593—nearly 300 years ago. The next is Butler's *Feminine Monarchy*, the first edition of which was published in 1609. My copy is dated 1644, and there have been a great many editions of this book. During the next year (1610) appeared the *Country Farm*, by Gervase Markham, in which he gives directions for clipping the wings of the queen. Warder's *Apiarium* was published in 1676, and his *True Amazons* in 1713. My copy of the latter work is of the sixth edition, published in 1726. By the way, Warder's name is given as *Warden* in Mr. Henderson's letter—a printer's mistake, no doubt. From this time on, books on bee-keeping came thick and fast.

A good translation of Huber would no doubt find great favor with our American bee-keepers. Something that would be still better, however, would be the republication of the original memoirs of Reaumur, Hunter, Maraldi, Schirach, and others. These are now absolutely inaccessible to most students, being buried in ponderous volumes of "Transactions." Huber's works are not inaccessible.

The best way would be to form a "Book Club," organized on the same plan as the European publication societies, in which each one subscribes so much a year, and gets all the books published. If such a club should be formed, it would, I believe, be the first club of the kind in this country, and there is but one name to give it—call it the LANGSTROTH CLUB. JOHN PHIN.

Cedar Brae, Paterson, N. J., Jan. 21, 1884.

Many thanks, friend Phin, for the important facts you bring forward. I have "Butler's *Feminine Monarchy*;" but if I am correct, I lent it to Professor Cook, and it is not at hand. Let us take time, and hunt up the best copy of Huber's writings that the world can furnish, and then have it translated by some one fully competent for the task. If it is possible, we should also like plates of the original cuts—all that have appeared in the different editions. If we can not get these, we will get a good engraver to copy the pictures.—By all means, let us have the Langstroth Club, friend Phin, as you call it, and then have a library of old books, accessible to all bee-keepers. Since you suggest the matter, I think I will have a book-case made expressly for old bee-books, and begin a collection that will be at all times open to visitors who come to see us, for we now have visitors almost every day, from different parts of the world. You nearly take away our breath, by informing us that there are over 800 distinct old works on bees. I had got a kind of conceited idea that there were not over 15 or 20 in the world, old and new.

SOMETHING THAT IS NOT ABOUT BEES,

AND YET A MATTER OF MUCH INTEREST PROBABLY,
AND OF GREAT IMPORTANCE SURELY,
TO US ALL.

FRIEND ROOT:—I would like to call your attention to "Diphtheria—Death—Hygiene," page 23, *A. B. J.* May I suggest that you copy the article in full in GLEANINGS at an early day? I know that it is long, and not strictly bee-talk; but if you can thus lead some poor care-worn and anxious mothers to turn to the light, you will be doing God's work. I know from experience that Mr. Pringle has the argument; his article can not be too highly commended. Hoping that I am not presuming too much in writing the above, I remain

Yours fraternally, E. M. HAYHUST.

Kansas City, Mo., Jan. 14, 1884.

On receipt of the above kind note we turned to page 23, and take great pleasure in giving place to it.

DIPHTHERIA—DEATH—HYGIENE.

This is a strange medley of subjects for a single article, and I make use of it to attract the reader's attention, for I want every reader of the *American Bee Journal* to read this, especially those who have children whom they are liable to lose for ever by that dread, fatal disease, diphtheria.

I am pained at reading on page 619, No. 46 of the *Journal*, Mr. Fradenberg's touching letter about the death of his two dear little boys from diphtheria; and the thought at once forces itself upon me, as it has many times before, is this fearful mortality from this dread disease necessary? Is it inevitable? I think not. Indeed, I know it is not. Of course, I know it is inevitable under the fatal circumstances, but the circumstances can be changed, and hence the fatal results changed from death to recovery. I unhesitatingly affirm (and I know whereof I affirm), that nineteen out of every twenty of those children who die of diphtheria could be saved by simple, common-sense home treatment without a doctor at all. The allopathic, or drug treatment, of this disease is nearly always fatal. I am not a physician by profession, but I have studied the whole of the popular (and unpopular) medical systems, and understand the principles upon which they are based, especially the popular drug system and the (as yet) unpopular hygienic system. I have no axes to grind one way or another. I have no interest in any of them, except to know the truth. I studied them and studied the science of health, as embraced in physiology and hygiene, for my own physical preservation and the physical good of those over whom I might have influence, and those dependent upon me. The consequence is, that for 25 years I have not taken a particle of medicine of any kind; and have been quite free from sickness. And this uniformly good health and exemption from sickness has not been due to an unusually strong and vigorous constitution, which, unfortunately, I never possessed. Indeed, it was just the reverse of this in youth, coupled with certain predispositions to disease that impelled me to look into and study the subject of health, and master the conditions upon which it depends. No medicines—patent or professional, quack or regular—are used in our family; no doctors are employed to medicate with drugs. Our habits are simple and natural, and we reap the reward in good health. Physically speaking, the real, natural needs of human beings are few and simple; the artificial and imaginary ones are many and complicated. Children are not reared according to nature, but according to the false and unnatural conventionalities of society; and the consequence of this is physical infirmities and moral obliquities. Our only child—now about 10 years of age—has never tasted a single drop of medicine of any kind—not even the simple remedies in common domestic use; and has always been free from sickness, with, of course, the exception of the contagious diseases incident to childhood and youth, such as whooping-cough, mumps, etc.

The reader will, I am sure, pardon me for so much personal allusion when he considers that I am writing this with a motive to possibly benefit some who may need instruction and admonition of this kind.

It is a well-known fact in human nature, that to some minds personal facts and experience on any subject are all-convincing; while to others the principles upon which the experience and practice are predicated must be presented and established. The latter class of thinkers look below the surface at the foundations and fundamentals; while the former are content with superficial appearances and *prima-facie* evidence. The safe way, then, in all matters not palpable or axiomatic is, that while mere *experience* may be adduced as an auxiliary for the purpose named, to put forward or postulate nothing that will not bear the scrutiny of science and reason. To illustrate this point: The man who has used tobacco for 50 years, and is now 70 or 80, adduces his age and experience to prove that tobacco is wholesome. The man who has used whisky-and-water half a century as a beverage, and is now an octogenarian, cites his age and experience to prove that whisky is wholesome; while another octogenarian who has used pure water his whole life without the whisky cites his age and experience to prove that water alone is the most wholesome beverage. But does the fact that the one who has used tobacco 50 years and is still alive, and the other whisky 50 years and is still alive, prove that tobacco is wholesome, or that whisky is wholesome? If it proves any thing in the eye of the physiologist, it proves that humanity is tough, and that some constitutions can stand a great deal of abuse. On the other hand, does the fact that the other octogenarian who used *only* water prove that water is wholesome? No, it does not, for we must be fair on both sides. It will thus be seen that *experience* alone without a rational or scientific interpretation is by no means a sureguide.

When the tippler lives to be 80, and avers that whisky is wholesome, and the teetotaler lives to be 80, and avers that only water is wholesome, science must step in and decide the matter between them, by inquiring what is whisky, and what are its relations to the living body of man; and what is water, and what are its relations to the living system?

When, therefore, I affirm the following propositions (which I do most emphatically), I affirm what is supported not merely by experience and *prima-facie* evidence, but what will stand the scrutiny of the highest intelligence and the most advanced science of to-day. The propositions are these:

First, All sickness, disease, and premature death, as well as all conditions of health, are purely natural sequences, mostly within man's cognition and control, instead of being either arbitrary "dispensations," or in any manner fortuitous.

Second, As a natural corollary of this, human beings have, barring unavoidable accidents and hereditary diseases, their life and health in their own hands.

Third, Following also from the above, nearly all the sickness, misery, and premature death with which the world is filled is caused by ignorance, and could be avoided by knowledge.

Fourth, As the preservation of health and life is or ought to be the highest concern of life, our highest and greatest duty is to study and make ourselves acquainted with the natural conditions upon which health and life depend, so that we may preserve our own health and instruct our children in this knowledge, and save them from premature death.

The masses, however, do not do this. The most deplorable ignorance on these subjects prevails, not only among the lower classes, but among the upper and so-called educated classes. I say "so-called," because no man or woman is educated who does not know how to take care of his or her body, or save their little ones from premature death from diseases which could either have been avoided altogether, or cured under proper hygienic treatment. Through unphysiological living,—the breathing of foul air and poisonous miasms, and the use of drugs, uncleanliness, etc.,—sickness invades the household. Wholly ignorant of the causes, the victims are equally ignorant of the remedies. The doctor is sent for. He gives his poisons. Some, with good vitality, recover in spite of them; others die.

With reference to the disease called diphtheria, as already ascerted, 19 out of every 20 of those who die might be saved were the parents properly enlightened on the subject, and the simple, natural treatment applied. I have never seen a single case prove fatal under hygienic treatment; but I have seen at least five-sixths die under the regular drug treatment.

In order to make this letter practically useful, and in hope of saving some of the little ones from pre-

maturation and unnecessary death, I will give here some instructions as to the treatment of diphtheria, which I have done before, and which has not been without good results.

Of course, it is impossible to give a detailed treatment to apply in all cases, as the *diphtheria* varies so much; but a general plan may be indicated. Cold applications to the throat, abstinence for a time from food, *enemas* to free the bowels, cooling drinks of pure soft water, tepid bathing, and thorough ventilation and cleanliness is the simple hygienic treatment of this disease, and will save every child and adult to whom it is applied in time, except, perhaps, those with very frail or scrofulous constitutions, whom no treatment could save. A small piece of ice taken into the patient's mouth and swallowed, or allowed to melt in the mouth, and then replaced by another, and so on, has been effectual, with good nursing, in many cases, without any special treatment. The rationale of this treatment is simply this: The cold applications to the mouth and throat, by reducing the violent heat and inflammation, arrest the *fibrinous exudation*, thus preventing the formation of the false membrane, which so often chokes the patient to death. It is very important that the feet be kept warm, and the excess of blood diverted from the head to the extremities. Indeed, a primary indication in all diseases is to restore the *balance* of the circulation; and this can be done in a simple, common-sense way by the application of water, heat, etc., to the different parts instead of resorting to the barbarous allopathic practice of bleeding.

Let all parents, as a conscientious duty, study the laws and conditions of health, so that they may not only preserve their own health, but that of their children, and save them from premature and unnecessary death. This is by far the most important of all knowledge, inasmuch as not only our own highest welfare is involved, but the future prospects of the human race.

ALLEN PRINGLE.

Selby, Ontario.

Friend Hayhurst, it surely behooves every human being to study carefully the laws that govern our health, and that save us from premature death. I hope our friend is right in saying that death from diphtheria is not necessary. I do know that the practice of medicine is undergoing some great changes, and I think that we are beginning to use fewer drugs and more common sense. I too have scarcely taken a bit of medicine in 25 years, and yet the amount of labor I do every day of my life is considered, by most people, enormous. I am not going to brag either, nor am I going to take all the praise of it to myself. Our family of five have hardly known any of these diseases, and we have scarcely known fevers. I give a great part of the credit to Mrs. Root, with her common-sense habits. She will have, and always would have, an abundance of pure air and pure water. The coldest day in the winter our sleeping-rooms are aired almost all the time they are unoccupied. Every thing and everybody has to be washed, and washed well. I tell you, just a little before they really need it; and the same way with ventilating the rooms. If the cellar does not always smell like a spring morning, a civil war will soon break out. The food also must be pure, wholesome, and healthful. In fact, during the 25 years or more I have known her, she has so thoroughly converted me to her ways that I can not stand it to sit, even a few minutes, in many of the waiting-rooms of our depots, or sleep in many of the sleeping-cars, to say nothing of crowded audiences. I have been in houses repeatedly where the inmates were sick or ailing, or under the doctor's care a great part of the year. I have known such families to employ doctor after doctor, when I was abundantly satisfied the lack of clean

water and pure air was all that ailed them. The directions given in the above article are very much like the treatment my wife gives the children for colds and sore throat. Swallowing ice in pieces the size of a bean is one of my favorite remedies when a disordered stomach would prompt me to drink more water than was good for me. When suffering from confinement and overwork, I get outdoors and ramble among the honey-plants, letting the sun have a fair chance on the bald spot on the top of my head. If that don't do, I help Samuel dig underdrains, and I like it a good deal better than drugs and physics.

DO BEES SELECT A LOCALITY BEFORE SWARMING?

SEVERAL INCIDENTS HAVING A BEARING ON THE MATTER.

HEREWITH give you a few curious incidents in regard to an absconding swarm of bees, as it settles the oft-asked question, whether bees do select at times a location as a future home, before they swarm.

About the 20th of August we observed a lot of bees in a Linden-tree, 60 ft. from our front doorstep. They were on a hunt, so it seemed, but passed in and out at a knot-hole 20 ft. up. Next day the number increased, and in a few days after we could hear them from our porch at night. On the 27th of Aug. our No. 33 swarmed, and they went directly to the tree.

Second incident: Esq. Colby, near here, observed bees passing in a tight barrel at the bung-hole, on a hunt, but increased in number until finally a large swarm came and passed in and took possession. At night he transferred.

Third incident: A farmer with whom I am well acquainted left his single-shovel plow inverted, or, as some would say, upside down, in the slough grass. In a few days he found a colony of bees with a fine lot of honey on the under side of the shovel, working away for winter stores, well contented in their grass home.

Fourth incident: Dr. Higgins, of our town, had a large swarm of bees select the chimney of one of his neighbors for a home, and I tried to smoke them out, but they refused to go until only a small remnant were left alive.

Fifth incident: The church steeple in our town was the home of a colony of bees for a long time, but they finally dwindled and played out (couldn't stand the music, I guess).

QUEENS THAT HATCH OUT AFTER THE CELLS ARE DESTROYED.

In looking over the last year's GLEANINGS I find many cases of queen-cells all being cut, and yet there are plenty of queens appear. Where do they come from? The cases are not isolated, but numerous, and if described they are slim, waspy, and long.

A. L. KLAR.

Pana, Ill., Jan. 14, 1884.

Friend K., you make a pretty strong point on the matter. I guess we shall have to admit that bees do send out scouts to look up a place to locate; and I guess, too, they often send them several days ahead, and go in considerable numbers so as to clean house, and get things fixed up a little. I presume it

would not do to say that they *always* do this; and yet I have been wondering if they did not make some kind of preparation or examination before they started out for a new home.

HIVES AND CASES.

REPLY TO J. W. PORTER, PAGE 52.

A S Mr. Porter's objections to Heddon's hive and case come to us so earnestly and honestly, and as they are the first I have ever seen of the kind, either in public or private, I feel inclined to reply to what I believe to be some mistaken notions of Mr. Porter. We should all make due allowance for the kind of climate and flora each one has to do with, and perhaps more particularly our inability to judge correctly of any system when we have been so long habituated to another, entirely different. As you know I have been a specialist for fifteen years, with from 100 to 500 colonies most of that time, and have been much inclined to experiment, more particularly with hives and fixtures, you will believe me when I say that I have thoroughly tested storing in sections in the brood-chamber, in both one and two story hives—sometimes in connection with top storing, and sometimes alone in the brood-chamber. I have used sections with glass and without, with outer caps and without. I have worked on the plan of removing each section as soon as finished, both in cases and wide-frame supers; also on the plan of removing them only by cases. I say I have tried these different methods thoroughly, because I have produced thousands of pounds of honey in nearly every way mentioned.

I am well aware, that I am very hard to suit; and when any one method or system succeeds in satisfying me two or three seasons, it is quite apt to satisfy many others. I can not find among my records where I have ever sent Mr. Porter a sample hive; and though he may have seen one direct from my factory, I conclude he has never used the system much. Mr. Hutchinson, as you very well know, does not jump at conclusions hastily. No one ever scanned more closely, or asked more questions, and vital ones too, than did Mr. H. when looking into my arrangement for producing comb honey. He has adopted it, and, I think, considers it unexcelled. I have reference to the hive, honey-board, cases, sections, and shipping-crates, the two latter which he exhibited at the Detroit fair.

Mr. Porter is quite right in saying that tiring up is essential to my system, and I think he would have been equally correct had he said that it is an advantage to *any* successful system. When we "tier up" three cases high, the bees work all through readily and satisfactorily, and we have no trouble with soiled combs by removing them by cases; but our only objection to removing them by sections is the greater amount of labor involved. We can do this without the use of separators, by pushing the sections sidewise, placing the new section next to those least finished; but this we do not wish, and need not practice. The narrow hive can hardly be called mine: many of our most successful producers use it. Adam Grimm used it while laying up more money from the production of comb honey than has ever been accomplished before or since by any other living apiarist, if I am correct. I used the 10-frame standard Langstroth for five or six years, for the produc-

tion of both comb and extracted honey; and since using the 8-frame for several years I much prefer it, both for safety in wintering, and getting the most surplus honey for the labor and capital invested. I may also add, solidity of the hive, and ease of manipulation.

On another page Mr. Baldrige, who is an old skilled producer, speaks of getting the brood high up in the frames, as near the surplus receptacles as may be, the great object being to get rid of *sealed honey*, over which the bees must pass to get to the second story. The 8-frame hive assists in that matter. In it there are fewer ranges of comb, which places an adequate amount of stores for winter in a better position to accommodate the bees during the long cold spells. Where a broader brood-chamber is reduced by dummies, the equally broader case contains some sections resting out over said dummies. In these the bees do not work and finish off their work as readily. This point we gave a thorough test. If our capital were invested in our queens, hives having the capacity of our maximum queens would be advisable; but as our capital is in our combs and wood, and not in the queen, there is more profit in using hives of the capacity of our minimum queens; in which case, said capital is always employed. This plan also re-bounds to our interest regarding labor.

In regard to thickness of our cases, there are no objections to making them any thickness desired, except expense and weight. Here in Michigan we have never been troubled by radiation of heat through the thin sides of our cases. We made two hundred with $\frac{3}{8}$ sides and ends, but observed no advantage, and speedily returned to the thin case, and much prefer it. All the time we were using those systems of surplusage which used a cap over the receptacles, thus leaving a space between said cap and the receptacles, which the bees could not get at or ventilate. We lost many pounds of honey during hot weather, and our last caps were made with movable tops that gave a thorough system of ventilation when required. This, however, was gladly given up for the more convenient, less expensive, and better case system. We prefer a smaller brood-chamber, as much for extracting as for comb honey. In all cases, with all systems, we always use a rain and shade board over each hive, said board being two by three feet. By experimenting I have come to the conclusion that any style of fixtures that require constant manipulation, such as extracting from the brood-chamber to give the queen room to lay, necessity of interchanging combs in order to get your capital all utilized, is not as good a system as my own. The nearer automatic we can get a practical, profitable, and satisfactory system, the better is that system. JAMES HEDDON.

Dowagiac, Mich., Jan. 22, 1884.

Thanks, friend H., for the good points you bring out in regard to 8-frame hives, and other matters pertaining to them. There is one point, however, which you hint at but don't mention directly. It is this: That with an 8-frame hive well filled with stores, the bees are less apt to get over to one side in winter, while their stores are over in the other side. But of course this advantage is secured just as well, or better, by the use of division-boards. I, too, have noticed that bees do not store as well directly over the dummies; but with the chaff hive having an upper story a trifle larger than the lower

story, I have not been able to notice an objection. My experience has been strongly in favor of an outer case to protect the case of sections; but very likely, allowing the air to circulate between these two cases would be an advantage. In regard to this matter of getting sections in the wide frames, or cases, placed over the brood, I am glad to be able to say that we have something right here from friend Doolittle also on this subject. Here him:

WIDE FRAMES VS. TOP-STORING CASES.

Seeing many are prophesying, at the present time, that the wide frames with separators will soon be a thing of the past, I am led to look the matter over a little to see if we can consistently do away with wide frames and adopt the top-storing cases entirely. In looking the ground over, I fail to see wherein the top-storing system has any advantage over the wide frames; while I think I see many advantages of the latter over the former. As considerable has been said regarding honey-racks for top storing of late, I will not dwell upon that part of the subject, but will tell how I use the wide frames, which will show why I think they have advantages not possessed by the others. I use two styles of wide frames, the major part of which hold but one tier of sections, and the minor holding two tiers. During the winter and early spring, these frames are all filled with sections containing starters of either natural comb or comb foundation, and stowed away ready for use as soon as the honey harvest arrives. The bees are built up as strong as possible, so that we have lots of bees in time for the honey harvest; and in order to prevent early swarming I set some of the combs containing sealed brood over in the space soon to be occupied by the side boxes. It will readily be seen, that I am thus able to give a colony nearly twice the combs during the breeding season that I could if I used a hive like friend Root's 1½-story hive. It will also be seen, that if I can coax the queen to occupy these combs early in the season, I can get a powerful colony of bees in the right time for the honey harvest, without their having a desire to swarm, which thing I could not do did I not have a hive which would admit of side boxing. Another thing all will admit which is, that the wide frames are the most convenient thing to use of any thing when honey is to be stored at the side of the brood-combs. Having our bees, and wide frames filled with sections all ready, we await the honey harvest; and as soon as the bees begin to store a little honey in the vacant cells in the brood-combs, I take out some of the frames in the side-box apartment, and set in a tier of sections, leaving one frame of brood beyond it. The same is done to the opposite side of the hive when we have sections to the capacity of 10 lbs. or more, surrounded by brood, the effect of which is to cause the bees to enter them at once. In a few days, when these sections are partly full, they are raised from between the brood and placed on top of the hive, and more wide frames of sections added between the brood, to take their places. By this plan we accomplish two objects, the first of which is an early start in the sections, and we also keep the bees from crowding the queen with honey, thus causing them to desire to swarm. In a few days more the two frames of brood are taken out, which is beyond the sections at the side of the hive, and the wide frames of sections moved to the outside of the hive, when a tier of empty sections is placed between them and the

brood. At the same time the wide frames at the top are spread apart, and those filled with empty sections placed between them, when the hive has the full complement of sections, which gives a capacity of about 70 lbs.

It will be seen, that by the above I have those bees at work in all the sections, and they have done so according to their natural instinct, which is to fill up any vacant space within their cluster. When only top cases are used, the bees must become crowded for room before they enter them, hence can not be gotten into the sections as readily as by the above plan, which results in a loss of time and honey. Again, when I have a prime swarm I give them at first but about ½ the combs, and surround said combs with sections, both at the sides and top, which causes them to enter the sections at once. They are kept thus for about 24 days, when the brood will begin to hatch, thus giving new strength to the colony, when the wide frames of sections are shoved back, and more frames added to the brood-nest, which prevents their casting a swarm right in the height of the honey harvest, as often happens when only top cases are used. In order to give a prime swarm box room enough on top, where only top boxes are used, the whole hive below must be filled with frames when the swarm is hived. In this case the first thing the swarm does is to fill these combs with honey, which remains there unless the queen is prolific enough to cause the bees to uncap it and carry it above. For this reason much valuable time is lost, and the bees are often slow to enter the sections, after thus having plenty of room in the brood-chamber to store honey.

Again, the old stock is often so weakened by swarming that the bees never enter the sections at all, when only top boxes are used. How many hives in the United States have sections placed upon them, only to be taken off as empty as they were put on? When I see that a colony having cast a swarm is not likely to enter the sections from being too weak (if the full number of brood frames is left in), I take out a part of them as the brood hatches, and place a wide frame of sections next to those left, together with two or three at the top, and thus I am able to secure something from each hive, which thing I could never do when I used only top boxes.

Lastly, I very often have nuclei or very small swarms used for queen-rearing, which I can use to advantage as honey gatherers during the honey season, if I can only confine them to a few frames. With top boxes only, I made a failure, as a rule, when I tried to get honey from them, unless I took their honey with the extractor; but when I came to use the wide frames, all I had to do was to give them as few frames as I desired, and place next to them a wide frame of sections, and next to that a division-board. To illustrate: The past season I hived a small second swarm (a thing I rarely do), on account of their young queen I wished to save. After they had been hived a few days I concluded the queen was not what I wanted; and as it was too late to return them to the parent hive, I gave them as many combs as I thought was right, and placed a wide frame of sections at each side of them. As they needed more room in the brood-nest, I gave it them, and at the end of the season I had 30 lbs. of nice section honey, and sold the (then) good colony for \$8.00. As the honey brought me 16 cts. per lb., this gave me \$12.80 from a small second swarm of bees, or a mere nucleus, as it were. I always try to make every hive in the yard yield me something, and I know of nothing so well calculated to accomplish that object as the wide frames; therefore, unless I change my mind it will be some time before wide frames go out of date with one person at least.

G. M. DOOLITTLE.

Borodino, N. Y., January, 1884.

Heads of Grain, From Different Fields.

BUNKER'S IMPROVED SIMPLICITY FEEDER.

TAKE a common pie-plate, or any shallow dish; set it on the mat over brood-frames; fill it with whatever you desire to feed; spread over it a thin cloth large enough to extend over the sides; turn up one corner of the mat, and it is done. There is no daubing around. The cloth settles as the bees take up the fluid; there can not a bee get drowned; and when you desire to ascertain if they need more feed, lift the cover of the top story, and you can see at a glance. You may publish this wonderfully simple plan to the world or not, as you see fit; I don't intend to get any patent on it.

T. C. BUNKER.

El Dara, Pike Co., Ill., Jan. 7, 1884.

Friend B., your feeder is substantially the bread-pan feeder, though on a smaller scale. I prefer the bread-pan because it holds more than a dozen pie-plates—does not cost any more, and when you are done with them they nest together in a very small compact space. I prefer a feeder square, so it can be set up against the side of an upper story, or, what is better, right in the corner, then the bees can crawl up the wooden sides, and easily go out and in. One friend suggests painting them and dusting them with sand, so the bees can hang on better; but if the piece of cloth laid over the syrup is large enough, they can easily get up there. However, I would much rather have a feeder like the Simplicity, that does not require any cloth. The cloth is in a very little while untidy, tangles bees, and is a bother to take care of.

WHO SHOULD PAY THE 55 CENTS?

Friend Root:—Will you please give your opinion on the following? Last April I ordered 20 hives from a dealer. After acknowledging the receipt of money, I could hear no more from him till he shipped, which was in June. Freight charges were \$5.84. The goods came in good condition, but four pieces were missing. I informed him of the fact, telling him I thought he should send them prepaid, which he did not do, and I had to pay 55 cents express charges. Now, what I want to know is, who should have paid the 55 cents? Should I have paid for his mistake? Until I am convinced that I am wrong, I can not, nor can I recommend any one else, to deal with him. If I am wrong, I would like to know it; if he is wrong, I should like him to know it. Please reply in next issue of GLEANINGS.

Bluffton, Ind., Jan. 17, '84. D. F. VALENTINE.

Why, friend V., I should say the question was very plain and simple. If a dealer omitted the pieces, I do not see how he can escape all the necessary charges to make good your loss. The bother of having to send for more, I should think, was enough for you. Of course, if you counted awkwardly, and imagined they were missing when they were not, you ought to pay for the pieces, and all expenses. However, I believe it is customary among business men to be a little merciful to one who has been so unfortunate as to make a mistake, and kind o' divide up

the loss. Though if you insist on your rights, I should say he is bound to pay the 55 cents. I am sorry to say, friend V., that very many business men have a fashion of slipping out of the consequences of their blunders the way you state, and I am afraid if you leave the friend whom you have mentioned, and open trade with somebody else, you will fare much in the same way. In lines of business where competition is sharp, however, you may find men who hold their customers by making every such little loss good, to the very letter. I have been wondering while you were giving the circumstances, if it were not possible that it was myself who was the guilty one. I shall not take back any thing that I have said, even if I am; but I think I shall pay that 55 cents very quickly.

THE GROUND-CHERRY, OR STRAWBERRY TOMATO.

Dear Gleanings:—I had the pleasure through your kindness last spring, of sending to quite a number of your readers some of my ground-cherry seed, which was received with much favor. Some years the bees work on the bloom almost constantly; at other times, but little. It is a fruit well worth cultivating, and the wonder is it is not in every garden. I think it can not be generally known, for every one who has it values it highly. They take the place of other fruit, and are particularly valuable when other fruit is scarce or likely to fail. They grow well anywhere—yield abundantly, and will keep (if left in the bush) till mid-winter, if desired. They are nice for pies, and many other uses, and I esteem them above any other fruit for canning and preserving. I have saved a nice lot of seed, and will gladly send a packet to any of your readers, if they will write me and send stamp.

A. T. COOK.

Clinton Hollow, N. Y., Jan. 10, 1884.

DIVISION-BOARDS WITH FELT LINING.

I want to describe the division-board I use; and if it has already been described, it will do no hurt any way. I use a common plain board, except I run a groove in each end and the bottom, and draw and tack in strips cut from old hats, letting them project sufficiently to make them perfectly tight when in the hive. This makes the best division-board I have found, and is easily done. There is no use of any hangers at the top, for it will stay just where you put it.

D. W. BELLEMEY.

Vienna, Ills., Jan. 16, 1884.

Your idea is not exactly new, I believe, friend B., although I do not remember to have heard of felt hats before for the same purpose. Unless the felt is pretty stout and firm, I fear the bees would propolize it fast to the hive, and then it would be torn in moving your division-board. Quite a number of the friends use a strip of rubber put in, in that way; and some of them with a fold made by doubling the rubber. We have found a little difficulty in packing chaff behind such division-boards, because they were so easily pushed over against the brood-combs.

OUR FRIEND D. S. GIVEN, OF THE FOUNDATION PRESS.

At the closing-up of a very pleasant letter from friend G., we find these words:

My health has not improved any for nigh two years; but the dread disease is pulling me down,

down, slowly; but it looks to be surely. I am marching for that home beyond, where we shall have no bother with presses and rollers and other cares, but will meet as friends, to enjoy an eternity of rest and joy. I have no hopes of any recovery. I have tried the sea, the mountains of California, and found no relief. I enjoy this climate very much, as I can ride out every day in the beautiful sunshine, which relieves my suffering very much. I have felt very thankful that my press business has fallen into such trusty hands as it has. But I am taking your busy time, and must close.

Yours most kindly, D. S. GIVEN.

Los Angeles, Cal., Jan. 11, 1884.

Friend G., we who are in the full enjoyment of health and strength hardly realize, I fear, the blessings we enjoy. Your letter is, in some respects, a sad one, and yet there is a bright thought that runs through it, of the "home over there." Thank God, there is a refuge for poor, suffering, and afflicted humanity, and a sure and eternal rest.

BASSWOOD-TREES FOR SUPPORTING WIRE FENCE.

I have a suggestion to make. In fencing, one great expense is the posts; now why can't we plant basswood-trees, and use wire fencing when the trees are large enough? Would the shade be much of an objection to growing crops? If it would, there are places where we could use them.

Don't we say too much about getting a big price for our honey? Would it not be better to try to raise it so we can afford to sell it cheaper? It does not seem to me it will ever become the staple article we wish, unless we can sell very cheap.

The season has been only a moderate one; mine averaged about 70 lbs., nearly all white, as the late honey was a failure.

ROWLAND WHITE.

Grand Rapids, Wood Co., O., Jan. 9, 1884.

Friend W., the basswoods will answer very well for the purpose you mention; but, like all other rank-growing trees, they spoil all the crops growing near them. On this account, most of the friends put them on the roadside, on the outside of the fence. I agree with you in regard to furnishing honey at a low price, and I have felt quite a degree of pleasure in furnishing honey for only 10 cts., in 50-lb. cans.

UPS AND DOWNS.

I went into winter quarters one year ago with 35 colonies, 30 of which were fair to good, and 5 were weak, but had young queens that I was desirous of saving, if possible. They wintered well until the middle of March, when there were a few warm days; and as I had to move my bees about half a mile, I thought best to move them before they had a fly; so I moved them during this warm spell. After moving, some of them began to dwindle, and kept on until the others were swarming. About May 1st the bees obtained their first new honey; from then until the 25th there were lots of blossoms; but the weather was so unfavorable that, when apple-blossoms were gone, the best colonies had not gathered enough to last until clover; but I had saved plenty of sealed honey in brood-frames for feeding (the cappings were mashed by passing a knife over them, and they were placed between frames of brood); fair to good colonies built up very fast, and had a surprising amount of brood by June 1st (4 colonies hav-

ing upward of 1000 sq. in. of brood). The first swarm issued June 4; the last one July 5; commenced storing in boxes June 15; worked well until the 25th; from then until July 10, when clover failed, the weather was cold and rainy. The bees got the swarming fever so badly that it greatly interfered with their storing honey. Commenced stimulating about the middle of July for buckwheat, which began to yield Aug. 17; stopped building combs the 23d, and the season for 1883 was over. I obtained of box honey, white, 900 lbs.; box honey, dark, 525 lbs.; extracted, white, 50 lbs.; extracted, dark, 25 lbs.; total, 1500 lbs.—an average of 60 lbs. per colony, spring count. I have at present 50 colonies, all of which, except 3, are in good shape for winter, with plenty of honey to winter on, besides several hundred pounds stored away for spring feeding.

The season was a very peculiar one; very wet in the spring; dry in June; wet again the last of June and first half of July, when it turned dry again, and continued so until September. The best part of clover was spoiled by wet, and buckwheat by drought. My best stock, Italian, with 15 combs of brood, cast one swarm and stored 171 lbs. of box honey.

Baptistown, N. J., Jan., 1884. JOHN B. CASE.

REPORT ON BEES; BLACKS AND ITALIANS.

I bought 11 Langstroth hives and two colonies of bees for \$22.00. One of the colonies was Italian, and the other black. The blacks swarmed twice; one swarm left for parts unknown. They made 15 lbs. of extracted honey in upper story. I then sold the two black colonies at \$5.00 apiece. The Italians swarmed twice, and the first young colony swarmed once, and I found a swarm of Italians on my hedge-fence, so I had 5 colonies of Italians and about 45 lbs. of comb honey. I gave one of these colonies to my little brothers, and sold them a hive, so I have 4 colonies left, which are packed in straw on their summer stands. This has been a poor honey season, and my first attempt at bee-keeping. If I had sold my honey at 15c per lb. it would make \$6.75. Bees on hand are worth \$5.00 per colony, \$20.00. Sold two colonies of blacks at \$5.00 per colony, \$10.00. Paid for foundation, \$1.80, leaving me a profit of \$12.95. I am well pleased with my success, considering the season and the experience I have gained.

Davenport, Ia., Jan. 1, 1884. ADAM LITIG.

ADVANTAGE OF HAVING LARGE LABELS IN A PROMINENT POSITION FOR JARS OF HONEY.

When jars are placed on the store shelf among other canned goods, they are not noticed, unless the "Honey" is large. I have some jars in a large store, and they are labeled, too, but not big enough, and hundreds of customers never see them, and there is a small store with the shelf about 6 feet from the customer, where they sold ten times as much as the other.

Madison, Wis.

JAMES McLAY.

MODERATE FAVORS THANKFULLY RECEIVED.

I wish to report my success in bee-keeping the past summer. I put 30 stands in the yard in April, after wintering without any loss; had one dwindle out in May; worked for comb honey altogether, in 1-lb. boxes. I took off 150 lbs.; sold at an average of 16 cts. per lb.; total, \$240. I have 50 good swarms in the cellar—not a very big yield; still I am out of Blasted Hopes.

Fayette, Wis., Dec. 26, 1883.

JOHN CLINE.

SHIPPING BEES BY THE POUND.

Will not some of the friends give us the benefit of their experience in shipping bees by the pound? What kind of food, boxes, etc., have been found to be the best? I sent bees last season from Maine to Utah. As a rule, I was successful, but in two or three instances I met with very annoying losses.

MORE ABOUT QUEENS ACROSS THE OCEAN BY MAIL.

Possibly some of the friends may be glad to know more particulars of the queens sent to me by mail, last summer, from Munich, Germany, by Frank Benton. The first one came through in excellent order; only one dead bee in the cage. I never received a package from any one in which every thing was in better order. The second one was just the reverse of that. All the bees but one were dead. The queen was immediately introduced to a colony, and when I last examined it, just before the winter commenced, she was alive and doing well. After this he shipped me three packages; but when they arrived, all the bees and queens were dead. As nearly as I could make out, they starved because the candy hardened to such a degree that they could not eat it. So the venture finally ended by giving me two queens, while three died on the way. All were packed in the same way, and the tin bottles contained plenty of water when the boxes were received.

E. A. GASTMAN.

Decatur, Ill., Jan. 19, 1884.

WIDTH OF SECTIONS.

What are we going to do about this difference in the width of sections, all the way from $1\frac{1}{2}$ to 2 in.? Can we not have a standard width? If an inch and a half is decidedly the best, why not adopt that, as soon as we can? I can not see that there can be very much difference between sections $1\frac{1}{2}$ and 1 $\frac{1}{2}$ wide, as we now have them.

"Strange such a difference there should be,
"Twixt tweedledum and tweedledee."

Many thanks to Mr. Doolittle for his valuable paper on keeping bees strong during the honey-flow.

WIRED FRAMES—ARE THERE ANY OBJECTIONS TO THEIR USE?

How many of those who have used wired frames for extracting from, like them better than the unwired? What are the objections to them, if any, besides the extra cost? Mrs. M. A. SHEPHERD.

Barry, Ill., Jan. 1, 1884.

My friend, a great part of our time at Columbus was devoted to this matter of narrow sections. The result seemed to indicate, that sections $1\frac{1}{2}$ to 1 $\frac{3}{4}$ can be used very well without separators; and if made the standard size, $4\frac{1}{4} \times 4\frac{1}{4}$, they will hold a pound of honey. These narrow sections will go into our regular cases without any trouble, giving 32 to the case, instead of 25. Of course, we should have to make narrow bottom-boards to support them.

There is no objection to the wired frames, that I know of, except their extra cost; in fact, it would seem that everybody was adopting them almost unanimously, by the amount of wire we are selling for the purpose. When first made there was an objection urged, because the bees sometimes tore away the combs around the wires; but this happens only when they are first put in, during a dearth of honey. After one good flow, so the comb is built out completely, the bees never bother that way afterward; and

after a set of brood has been reared in the cells, the cocoons cover the wires, and make the whole fabric strong and substantial.

THE SPEED OF BEES.

Our friend Ewing, of North Carolina, settles the question to his own satisfaction, by declaring that the bee was created a beast of burden, and, therefore, is not endowed with speed. But this inference is not conclusive. The horse is a burden-bearer, and it is also prized for its speed; and the carpenter-bee is a clumsy-looking fellow, but he can dash away at a rate that prevents the eye from retaining his image. Last summer, while watching a swarm in the air, I noticed that the bees appeared to be lines about three feet long. This suggested to me the following plan to determine their speed. Mount an object the size of a bee so it can be revolved in a circle. Move it at a rate of speed that will make it present to the eye the same linear appearance that the bee does in the swarm. Then time its revolutions and make the necessary calculations, and you have the speed of the object, and, approximately, that of the bee. Second swarms are the best for tests of this kind. And the afternoon, with the bees lower than the observer, and between him and the sun, gives the best view.

J. M. BEATTY.

Shaw's Landing, Pa.

Your suggestion is a very ingenious one, friend B., and will give the rate at which bees fly in curves pretty definitely, without question.

REPORT OF THE N. E. OHIO AND N. W. PENN. BEE-KEEPERS' ASSOCIATION, HELD AT JEFFERSON, O.

The subjects discussed were ably handled by Mr. D. Vidette, of North East, Pa., M. A. Mason, of Andover, Ashtabula county, O., and I. McGonnell, of Waterford, Erie county, Pa., and many others, all good men.

IS MODERN BEE-KEEPING A SUCCESS FINANCIALLY?

Was answered in the affirmative by nearly all present.

IS IT BEST TO CONNECT OTHER BUSINESS WITH BEE-KEEPING?

Affirmative generally for all beginners; but if one has 100 stands, not, and the best business with bees was farming.

THE BEST METHOD FOR INCREASING COLONIES.

The raising of queens from cells left by the first natural swarm, by placing in nuclei, and then building up.

WHICH IS THE BEST HIVE FOR THE PRODUCTION OF COMB HONEY?

Did not cause much discussion; let every man use the hive he had, if he liked it; a half-story surplus on the L. frame was the favorite for one-pound sections.

BEST METHOD OF PRODUCING COMB HONEY.

Mr. M. A. Mason deserves the thanks of all bee-keepers for the plain and simple explanation of his method, which consists of giving the first swarm of the season in a new hive, then taking cells and two frames of brood from the old hive, and placing an empty section case under the one already on, then giving the next swarm in hive No. 1, and so on, giving the best results.

HOW BEST TO PREVENT SWARMING.

Giving young queens, and removing brood, and giving room in hive, etc.

HOW MAY WE WINTER OUR BEES SUCCESSFULLY?

Chaff packing on summer stands is the best.

HOW RAISE THE BEST QUEENS?

Cells from the full colony, deprived of queen or cell, left by the first natural swarm.

F. M. BLANCHARD.

Orwell, Ashtabula Co., O., Jan. 20, 1884.

FRAMES FILLED WITH FDN. MADE BY THE GIVEN PRESS: A SUCCESSFUL SHIPMENT.

On page 31 of January GLEANINGS you express a doubt about fdn., put in frames by the Given press, being strong enough to bear shipment. I will say, that three years ago next April I ordered of James Heddon 4 hives and 40 frames with fdn., put in on wires by the Given press, and they all came through in good condition. I do not think that there was a wire broken, or a piece of foundation broken down, and it came clear up to the top-bar too, but did not quite fill at ends and bottom. I presume they could be made to fill all around, if necessary. I used the hives and frames that summer to put new swarms in, and I never saw anything built out nicer than those combs were, and it did not make any difference about the wires in the cells; the queen laid, and the eggs hatched, and were sealed over just the same as any.

CHAS. B. RICHARDSON.

Hollis, N. H., Jan. 21, 1884.

Very glad to hear it, friend R. You did not say whether they went by express or freight—probably by freight. This shipment was made in warm weather. It would likely have been more difficult in February or March; but it is also difficult to make such frames stand shipment in cool weather, when put on wires by hand.

LADIES AT BEE CONVENTIONS.

The bee-keepers of Miami County met on the above date at the auditor's office at Troy, and organized the Bee-keepers' Association of Miami County, by electing the following officers: President, J. P. Johnston, Piqua; Secretary, Miss Flora Combs, New Carlisle; Treasurer, John M. Pearson, Tepadunne, and a vice-president from each township, as far as represented. Seventeen bee-keepers went into the organization, including several ladies. There was considerable enthusiasm manifested, and much intelligence.

PHILLIP NOLAND.

Piqua, Ohio, Jan. 19, 1884.

The feature that interests me most in the above is, that the convention had good sense enough to put in a lady as secretary. At our convention at Columbus, Mrs. Culp was put on a committee. Of course, she objected, and excused herself; but I told her that she must let her name appear, in any event, to give weight and influence to the committee, for she was the most successful honey-producer who had attended the convention for two years past. I think I made no mistake in saying this. Now, then, friends, let us not forget to extend an invitation to the ladies to take part in our bee conventions.

PEA-VINE, OR MAMMOTH RED CLOVER.

I saw a very interesting piece in January GLEANINGS, page 20, by H. B. Harrington, on the pea-vine clover. It certainly is of interest to the bee-raiser, and to the farmer. The latter part of July I went through a field of mammoth clover. I heard the bees humming, and wondered what they were doing in the clover field. To my great surprise, they were

gathering honey. Italians, blacks, and bumble-bees' were busy. Will Mr. Harrington tell how to save the seed, and how to prepare it for hay? I am trying to get up a club to send for some seed, as it is hard to get here.

J. N. CHAPMAN.

Smoky Valley, Ky., Jan., 1884.

I just submitted the question to neighbor H., and he says the seed is saved just the same as any other red clover, with the exception of what he says on the subject in the article already alluded to. I believe the hay is saved as any other hay. Any one familiar with curing clover will know exactly what to do with it.

DEATH TO BEES FROM PARIS-GREEN POISONING.

Mrs. Mosher's poetical effusion in January GLEANINGS reminds me that for a day or two last summer I had considerable mortality in one hive—the bees wabbling about in a queer kind of way, and about a quart or two of dead ones, as the net result. As the trouble ceased as suddenly as it began, and was confined to one hive, I concluded the bees must have been working on the potato-blossoms in the garden, which had just then been dosed with Paris green. I could assign no other reason.

C. W. YOUNG.

Stratford, Ont., Jan. 8, 1884.

BENJAMIN FRANKLIN'S OPINION OF AMERICAN HONEY; AN OLD LETTER.

We copy the following from the *Evening News*, of Cleveland:

Colonel A. S. Morgan, of Pittsburg, has in his possession the following hitherto unpublished letter: "PHILADELPHIA, January 8, 1787. Mr. John Morgan, Sir: I find myself greatly obliged to your good Father for the Hive full of Honey which he has so kindly sent me, and to you for thinking of me and proposing it. I use it as a Part of my Regimen every Morning at Breakfast. It is much the best I have met with in America, and I think fully equals the famous Honey of Narbonne, so much esteemed in France. With my hearty Thanks, please to present him my best wishes for his Prosperity, and many happy Years to you both, in all of which this Family joins me. I am, sir, Your most obedient Servant."

"B. FRANKLIN."

BOTH SIDES OF BEE CULTURE.

It seems to me that the friends can not rightfully accuse the bee-journals of "giving but one side of the question," when they publish, time after time, such letters as those of friends W. Z. Hutchinson and H. W. Simon, in GLEANINGS for Jan. 1, pp. 5 and 28. Send in your reports for Blasted Hopes, friends; or, if you do not wish to do so, as friend Simon says, do not blame the bee-journals for not publishing them.

L. P. SCOTT.

Kinsman, O., Jan. 6, 1884.

150 LBS. OF HONEY, AND \$18.00 IN MONEY PER COLONY FROM AN APIARY OF 43.

In the fall of 1880 I had 47 colonies; in the spring of 1881 I had 43—three very weak. From the 40 stands, which I worked for section honey alone, I averaged nearly 150 lbs. per colony, which I shipped, besides several hundred partly filled boxes still on hand. The largest yield per colony was about 225 lbs.; three of them made a little over 225 lbs. each. The honey sold brought me \$18.00 per colony, besides expenses. I have at this time 44 stands. The season this year was the best for many years. My bees did as well, or better, than any I have heard from in this section.

JOSEPH A. HART.

Vineyard, Ind., Nov. 10, 1883.

FASTENING THE FRAMES FOR SHIPMENT.

After reading an article on page 30, Jan. GLEANINGS, from John Do, under the head of Growlery, I thought I would send you a few little simple tins that we use; so if you should receive any more such inquiries you will be prepared for them. It is simply a piece of tin cut $\frac{1}{2}$ inch wide, and doubled so the short end is $\frac{1}{2}$ inch long, and the long end about $\frac{3}{4}$ inch. The short end goes inside the tin rabbet. It is slipped on the tin rabbet, between the frames. I first nail on the sides of the hive, in corners, a strip of wood $\frac{1}{4}$ inch thick, and about 2 inches long, with $\frac{1}{2}$ -inch wire nails, so they will come up even with top of frames; then put in frame; then put on one of these little tins at each end, then frame, and so on until you get in your ten frames. It is what we call Howard's device. My friend Howard seals the need of something to space the frames, and hold in place while moving the hive, invented this device (and it didn't rack his brain much either). We all like it much. It takes 18 for a hive, and is easily made at any tin-shop. I would like friend Do, or any other bee-man, to try them. I don't ask you to help me get it patented, either. D. C. BLAIR.

Columbus, Pa., Jan. 10, 1884.

Friend B., your device is quite ingenious indeed; and if it were only the tops of the frames we wished to fasten, I believe it would be ahead of all other devices. The little clips could be made for perhaps 10 cts. a hundred, and they can be slipped in without any possibility of killing a bee. The objection is, that they do not hold the lower end of the frames from spreading, as the spacing-boards do. No doubt they would answer every purpose for fastening the combs where they are transported in a wagon or buggy, or even by rail, if the owner did all of the handling of the hives; but where hives of bees are to be trusted to the mercy of railroad men, I think I should hardly dare risk them without the spacing-boards shown in our price list.

CAN WE AFFORD THE BEST KIND OF SUGAR TO FEED OUR BEES?

No, Mr. Root, that won't do; we shall have to stop somewhere, and why not at once? Some years ago, New Orleans sugar or common molasses was good enough to feed bees; then coffee A and grape sugar must be bought; then those were not good enough, but granulated; and now you have taught them to spurn that, carry it out of the hive, and throw it away, even when they were likely to starve. You didn't come along here, and slyly whisper to those of mine that there was a grade of sugar better than what they were getting, did you? Next we know, pulverized sugar will not be good enough, but something still better must be found to suit their fancy stomachs. I am unable to figure out where my profits are to come in, to sell honey at 10 cts., and buy sugar at 13 cts. per lb., to feed them. I guess they will have to come down a peg or two.

THE JONES HONEY-BOARDS.

I see there is some discussion on the Jones zinc queen-excluder. I tried half a dozen of them last season, and in two or three cases I found the queen had passed them. I shall still use them next season, for I have been very badly annoyed by their going into the upper stories. A. A. FRADENBERG.

Port Washington, Ohio, Jan. 4, 1884.

Friend F., if you buy any kind of bee

candy, you have to pay about 15 cents per pound for it, at the lowest estimate, and that is 2 cents more than the powdered sugar. Very likely it would behoove us to have our bees so fixed for winter that they will not want any candy or sugar either.—I am very glad to know that you find the zinc honey-boards good, even if some queens do get above.

MAKING ODD-SIZED SECTIONS AND FRAMES.

The extra number of sections is all right. When you make odd-sized sections for me, and they overrun the number ordered, send them along, and charge them to my account, and I will see that they are paid for, whether the money is in your hands or not. G. M. FREEMAN.

One of the great difficulties in making odd-sized sections, frames, etc., is to pick out just enough lumber to make the amount called for, no more and no less. As it is next to impossible to do this, we generally aim to have a few more. As they are of no value to us whatever, we have been in the habit of putting them in at the same price, subject to the approval of our customer. In most cases we get a reply like the above; but once in a while we have a friend who insists on having orders obeyed to a letter, and who will not pay for the overplus. If they run under, we have to take the chances of a sharp letter because we did not send as many as ordered. I have mentioned this that our friends may know why we so much dislike to make small lots of odd-sized goods.

PEAT FOR SMOKERS.

Your postal of the 20th is received, asking for price of peat per barrel. I think I can furnish it at \$2.00 per barrel, and probably lower. I shall not be able to ship any before spring, as it is snowed under now. Please let me know if you want any, and how much you want, and I will send price, and make preparations for shipping. ELIAS BERG.

Cicero, Ind., Nov. 28, 1883.

At the price you mention, friend B., I think a great many of the brethren will take a barrel. You may put me down for five barrels. Of course, it should be sent by freight.

SMOKER FUEL.

For cross bees I take a small piece of an old quilt that has been used over the frames until it is covered with propolis, and put it in the smoker with the rags or wood, or whatever I am burning. It makes a terrible smoke, and a few whiffs of it always quiet the worst bees I have. I guess they think their house is on fire when they smell the burning propolis; any way, they fill themselves with honey as quickly as they can, and then stand on their heads and just howl for mercy. Nebraska is going to lead the world in quality of honey some day; see if she doesn't. Bees did very well here this year. CHAS. R. THOMPSON.

Fort Omaha, Neb., Nov. 27, 1883.

ROBBERING AT 50° TEMPERATURE.

My attention was called to the bees to-day on their summer stand, with their usual place of entrance left open, when, to my surprise, I found one colony flying around as in June. I watched them awhile, and found they were robbing that hive, with the

mercury standing at 50°—pretty cool business. It was a very bright sunny day, with the snow melting away. I interposed by placing wire cloth over the entrance, to prevent any further ingress. I expect to find the bees dead. I was afraid it was too cold to open them to see what condition they were in.

E. L. JOHNSON.

Cincinnati, Ohio, Dec. 28, 1883.

AN A B C SCHOLAR 53 YEARS OLD.

I commenced bee-keeping last spring with one swarm, as an experiment, for I had never kept bees. I think they were weak, for there could not have been 2 quarts of bees in the hive; had scarcely any honey, and had to be fed; but I think I did not feed late enough, for I could not get the sugar. They did not swarm, made no surplus honey, filled six combs half way down with honey, capped; size of comb, 12x14, and only about doubled the quantity of bees. But I am not in Blasted Hopes; but, on the contrary, I am getting the "fever," and shall send for more bees in the spring. Bees are all right to date. There was a profusion of wild flowers here, and why did my bees not swarm? They were brought a distance of 35 miles. I am ignorant of modern apiculture; have never seen an extractor, smoker, or any of the modern implements of apiculture.

DRONES—ARE THEY NEEDED IN EVERY HIVE?

Will bees work as well in the absence of drones as when they are present? I have not seen a single drone about my hive during the season, and there is no drone comb in the hive.

I don't know of another swarm of bees within 30 miles of here, and if mine should abscond, they would be forced to come back, for there are no hollow trees for them to go into; the largest timber here is second growth cottonwood.

Empire, Dak., Jan. 17, 1884.

ANDREW CRAIG.

Friend C., the bees work all right with no drones in the hive, although it has been surmised that they work with more energy when at least a few drones are present; and I am inclined to think that this is the case. I think your bees would abscond all the same, even if there are no trees for them to go into, for they often build combs in the bushes, especially with a climate as warm as yours. If your locality is a good one, your swarm did very poorly. I should say the queen was not up to the average.

CALIFORNIA SAGE IN THE NORTH.

Please answer through GLEANINGS, will California sage grow here in 40° north latitude, or have you ever heard of any being tried?

J. G. NORTON.

Macomb, Ill., Jan. 18, 1884.

I have been told, friend N., that California sage would not grow with us. We have raised a few plants, however, but I kept them mostly indoors. Can any one tell more about it?

TARRED PAPER FOR BEE-HIVES.

I want to know if a house, covered inside and outside with tarred-paper board, would be frost-proof; also would the tarred paper affect the honey in any way? I want some place to keep honey in.

Bunker Hill, Ill., Jan. 18, 1884.

Geo. Drew.

I do not think tarred paper would do the honey any damage. It might, however, give it a taint, if just put in, and the honey were put just next to it.

IF EXTRACTED HONEY IS 8 C., AND COMB IS 15 C., WHICH SHALL WE RAISE?

I commenced operations in the spring of 1883 with 98 colonies. Natural swarming commenced June 2, and in a short time they increased so rapidly we could not get hives ready fast enough, so commenced doubling, or putting two swarms together, and put about 120 swarms into 75 hives, which made them strong; consequently, from doubled swarms I got a nice lot of comb honey in 1-lb. sections. The Blue Ridge is a good locality for swarming, but does not always prove so fruitful as it has the past season. I raised about 2000 lbs. of comb honey—1500 in one-pound boxes, 500 in old-style five-pound boxes. I never raised any extracted honey; would like to have advice in regard to raising honey for the market. Will extracted honey pay as well at 8c. as comb honey at 15c. per lb? Our honey is principally made of blue thistle, white clover, and sumac.

TIME OF BASSWOOD BLOOM.

We have some basswood which blooms about June 25, and lasts 10 or 12 days. My bees have been very much neglected in the past, having a stock farm of about 600 acres to claim my attention; consequently, bees have to be put off for a more convenient season.

T. WM. FLEMING.

Paris, Fauquier Co., Va., Jan. 18, 1884.

Friend F., I presume there will be a good many different opinions in regard to your question; but as you state it, I think I should work for comb honey. If extracted honey brings 10 cts. by the barrel, then I think I should raise extracted. I should like to hear from friend Doolittle in the matter, and as many others as have an opinion to offer. This is certainly a very important question. Perhaps wisdom would dictate that you should produce both, until your market has given a decided answer as to which is preferable.

"Forgettery."

MR. A. I. ROOT:—As you say you are in my debt five cents, you will please send me a dinner-horn—a good one that my wife can blow. Inclosed find postage for same.

Brick Church, Tenn., Dec. 11, 1883.

Friend—what's your name?—when I was a small boy, my father used to tell me, in a joking way, about driving so far that we came to the "jumping-off place." Now, when our clerks read your letter as above, they thought they had come to the jumping-off place, sure, for there was no way in the world they knew of to get a bit further, till we got the postal card below:

I wrote you for some of your goods about three weeks ago, and have not been able to hear from you since. Please write me if you received the money or not.

W. G. BURGESS.

Brick Church, Tenn., Jan. 8, 1884.

Why, bless your heart, friend Burgess, we got the money, to be sure, and you can not think how happy it makes us to think we are now able to send right along that dinner-horn for your wife to blow on. When I think of your having been without your dinner all these long weeks, or at least until this

last order, just because of the want of that dinner-horn, it really makes me feel sad and melancholy. But then, why didn't you sign your name to that letter?

Reports Encouraging.

FROM 80 TO 140, AND 6000 LBS. HONEY.

LAST spring I sold off nearly half of my colonies; and after one of the most backward and wet springs ever known here, I commenced the season with 80 colonies, above half of them fair stocks, the remainder indifferent, with but small amount of brood on the 1st of June. I made from the above, 5000 lbs. of white-clover honey in 1-lb. sections, and 1000 lbs. of extracted: all sold at 16 to 18 cts. for sections, and 12½ for extracted; but about 400 lbs. still on hand, at A. V. Bishop's, Milwaukee. Increased to 140 colonies, of which there are 120 in cellar, and 20 chaff packed on summer stands. I did not accept any after-swarms. W. ADDENBROOKE.

North Prairie, Wis., Jan. 1, 1884.

MY REPORT.

I had six colonies of bees in the spring. I now have 15 in good condition for winter. I have them well tucked in on their summer stands. I got 534 lbs. extracted, and 54 lbs. box honey. Extracted is 10c., and comb 12½c.; dull sale. W. J. WOODS.
Villisca, Iowa, Dec. 20, 1883.

I commenced last spring with 4 good ones and 2 poor ones, and have 24 now. I sold 10 last summer, and got 221 lbs. honey, besides what we used in the family, and I made my own hives, and did my housework, and had all the care of the bees. I think a woman can keep bees, if she is not lazy.

JENNIE C. MARCH.

Tecumseh, Neb., Jan. 2, 1884.

A MAGNIFICENT REPORT FROM LOUISIANA.

Extracted 11,500 lbs. of honey; a young daughter and myself attended to the work about the apiary and extracting, which took about one month. Commenced with 70 colonies in the spring; increased to 112 colonies, averaging about 165 lbs. honey to the colony. B. MARIONNEAUX.

Plaquemine, Iberville Parish, La., Jan. 18, 1884.

FROM 3 TO 10, AND 336 LBS. HONEY.

As I am one of your A B C scholars, I thought I would give my experience with bees. I commenced the spring of 1883 with 3 colonies; increased to 10. I got 336 lbs. of extracted honey. My bees are all in cellar, in good condition. I give you A B C book and GLEANINGS all the credit for what I know about bees. S. FRANKHINSER.

Bettsville, Ohio, Jan. 21, 1884.

I have now 70 colonies of bees—Italians. I had 30 last spring. I have taken 6000 lbs. of honey from them, mostly extracted. I have sold it mostly all in this vicinity. I put it up mostly in 5-gallon kegs, and sold whole packages at 10 cts. per lb. I had an extra quality of honey, it all being clover and basswood. I had no fall honey. I am wintering my bees in a cellar, outside, made on purpose. I have some pipes put in to give them fresh air. I think bees want a good letting-alone in the winter; disturbing them hurts them, I think. A. C. SANFORD.

Ono, Pierce Co., Wis., Jan. 8, 1884.

MY REPORT FOR 1883.

I went into winter quarters with 4 colonies; lost one; commenced the season of 1883 with 3 good ones. My crop of honey was 300 lbs. extracted, and 40 lbs. comb, mostly white-clover honey. I go into winter quarters with 12 good colonies, mostly Italians. My increase was by natural swarming.

E. M. THOMPSON.

La Fontaine, Wabash Co., Ind., Dec. 31, 1883.

FROM 9 TO 17, AND 28 LBS. OF HONEY TO THE HIVE.

I began the season with 9 stands, all in fair condition; increased to 17 by natural and artificial swarming; got 28 lbs. extracted honey to the hive, spring count. My bees are all blacks, and are in good condition for winter. The past season has been a very poor one for bees. Mesquite and horsemint bloomed profusely, but secreted but little honey. I have not made bee culture a great success this year, but I look forward to better luck next year.

Hubbard City, Tex., Dec. 23, '83. S. F. DELLIS.

FROM ONE TO EIGHT, AND 300 LBS. OF HONEY.

I came here in 1882, and concluded to go into the bee business at this place. I find it a good locality for the business. I bought me one stock of bees for \$5.00 in 1882; I now have 8 stocks on hand, and I have taken about 300 lbs. of honey, worth 20 cents per lb., and my bees are worth \$7.50 per stock. I think this is not bad for a small investment. I have a movable-frame hive, which is a good one. I will give to any one a \$5 gold-piece who will come and find a cell full of bee-bread in the stock of honey that I made last season. I only wish I had 100 stocks to work with this season. There are plenty of wild bees here in the timber. One man found 84 bee-trees the past season. Wm. MONTGOMERY.

Nob'e, Richland Co., Ill., Jan. 4, 1884.

FROM 33 TO 58, AND 2600 LBS. OF COMB HONEY.

This has not been a very good honey year here. But as I little more than paid expenses, I do not know that I ought to complain. I started in the spring of 1883 with 33 colonies; increased to 58, and took about 2600 lbs. of comb honey, all in 1-lb. section boxes. Have sold 2234 lbs., and have on hand yet between 350 and 400 lbs. What I have sold brought me \$299.61; had to sell it for 12½ and 15 cents per lb. My expenses were \$82.77. Five of my earliest swarms went off—took to the woods—last spring.

J. A. KENNEDY, 75.

Farmingdale, Ill., Jan. 16, 1884. Per Louisa.

WHAT A WOMAN CAN DO IN THE WAY OF ASSISTING TO KEEP BEES.

During this last season I wired 308 frames; put the foundation in, put together most of the section boxes we used; helped take off all the honey, and cleaned off most of the sections of honey, ready for market. It is no small job to clean off so many sections, besides holding the smoker. So you see I have had something to do to occupy my idle moments.

L. C. K.

You see, friend Louisa, I do not know whether to consider you a juvenile, or our good friend Kennedy's "helpmeet." But at any rate, I am glad to know he has somebody who can help him about his bees, and write his letters in so good a hand as you do. In regard to those sections, I think a great many of the bee-friends seem to almost ignore the fact that we may so protect the sections when put on the hives, that the bees

have very little chance to soil them. Many of the cases designed for setting over the hives permit the bees to go right up on the underside of the section. This I would never allow; and, as you notice, our crates and wide frames are all made with a view of keeping the section as clean as when it left the saw-table.

FROM KANSAS.

I thought it was time I sent in my report. I commenced in the spring with 23 colonies. Some of them were very weak, and I have increased to 51, and got 900 lbs. of comb honey. I got 15c. for the extracted, and 20 for the comb honey. I have sold 3 colonies at \$8.00 apiece. I left my bees all on their summer stands. We have had a very fine fall and winter till Jan. 1, and then it blew up cold, and stormed very severely. I was uneasy about my bees for two weeks. I was very glad when it turned off warm again, so they could fly. They are all right yet. It was 21° below zero. I am going to have my beeyard look nice. I set out 100 grapevines last spring, and they grew nicely, and this winter I got a nice fence around them. I think bees will do well here, if they are attended to as they ought to be. Last summer I attended to my bees, and did my house-work too; but I think I shall have to have some help this season, if my bees do not all die. Last fall I took some bees and honey to our county fair, and I got the premium on honey, but they would not give a premium on bees. I will report again in the spring.

MRS. MALINDA A. WILKINS.

Seneca, Nemaha Co., Kan., Jan. 17, 1884.

Notes and Queries.

I WANT to get a number of colonies early in the spring, and would like to correspond with some bee-keepers near me as to price.

D. W. BARTHOLOMEW.

Bridgewater, McCooke Co., Dakota.

No report, further than that the ½-lb. bees and queen purchased of you in July, 1882, have increased by natural swarming to five strong colonies.

Weston, O., Nov. 30, 1883.

ED. BAGGALEY.

GEO. W. HOUSE'S HONEY-RACK—A DESCRIPTION WANTED.

Geo. W. House claims to have the best honey-rack in existence. Please have him describe it in GLEANINGS.

Woodburn, Iowa, Jan. 10, 1884.

JAMES SPENCER.

"TAKE NOTICE" LABELS—A CAUTION.

I would suggest that your "Take Notice" label for extracted honey contain caution about overheating. I have frequently known honey to be nearly spoiled in melting. I would like some of the labels if so printed.

H. D. BURRELL.

Bangor, Mich., Nov. 24, 1883.

A SUGGESTION IN REGARD TO FRIEND STURWOLD'S HONEY-CASE—SEE PAGE 11.

Regarding Sturwold's show-case for honey, I would say to you, if you would put a common looking-glass in the inside of the door it would make a better show.

L. T. COLBY,

Enfield Ctr., N. H., Jan. 11, 1884.

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.

MEDINA, FEB. 1, 1884.

Neither pray I for these alone, but for them also which shall believe on me through their word.—JOHN 17: 20.

DON'T send us any more back numbers of GLEANINGS of any kind. I guess there must be a good many of the friends who wanted the ten cents more than they did their back numbers, by the way they came flying in.

In our last issue the types made us say, in speaking about wire on spools, "2½ feet for one cent," where it should have been 21½. No. 25 spool has 215 feet. It was all owing to the types, of course. We all know how to "figger" here.

We are still out of spider-plant seed. Who has any fresh seed that they are sure will grow, and what will they take for it? By the way, would it not be a good plan for somebody to go into the business of raising seeds of these staple honey-plants, that we may know where to get a supply next year?

DEAR me! what troubles we do have! Twenty thousand price lists have just been printed, and in every one the price of alsike is put at the old last year's figures—\$15.00 per bushel, when it ought to be \$10.00. Probably we shall not have a very large trade in alsike, unless our patrons are subscribers to GLEANINGS.

THE *Bee Keepers' Magazine* for January comes to us in new type, on new paper, greatly enlarged, and so much improved throughout that we hardly knew it. It came to us rather late in the month, it is true; but as GLEANINGS has been rather on the late style, we think we won't make any comments. Our enlarged printing-office, with eight hands hard at work, does not seem to be equal to the demand for circulars, labels, and price lists.

FRIEND C. S. ADAMS, of Williamson, Wayne Co., N. Y., has a quantity of alsike and timothy, mixed. Perhaps one-third part of the mixture is alsike. The seed is otherwise clean; but as the hulls are off from a great part of the timothy, it is next to impossible to separate it. Neighbor H. says he thinks, however, that timothy will grow just as well. Anybody wanting such a mixture might correspond with friend Adams. He thinks it ought to be worth about \$5.00 per bushel.

WOODEN SEPARATORS.

THESE seem to have lost favor. Dr. Besse mentioned at the convention, that although he made and sold a great many of them, he had discarded them. The principal objection seemed to be that they will warp. This might be obviated by making them thicker; but this would increase the expense, and also occupy valuable room in the brood-apartment. If separators must be used, tin seems to be the best material to occupy little space, without being affected by the dampness of the hive.

We have been shipping bees to Florida to-day, this 29th of January. So far as we have examined, our bees have gone thus far through the winter beautifully.

DID you ever! "Willie" tells us we have now 5822 subscribers, and it is not yet quite the first of February, either. You have given us over 1500 names during the month of January. Well, well! We shall have to print a larger edition, and shall also be able to make some other improvements for your benefit, which we had intended. Many thanks to you, each and all.

THAT 6-HORSE-POWER ENGINE AND BOILER.

THE one we mentioned last month was sold almost as soon as the journal was out, and two more friends wanted it. Well, after some correspondence with the manufacturers, I have been enabled to offer a brand-new one, same kind, for \$325. It is all fitted out with governor, pump, check valve, lubricator, oil-cups, glass gauge, heater, stack, and spark-arrester; and while it gives fully 6 horse-power, our pony Jack drew it easily over the snow on a pair of bobs. It is a very pretty-looking machine, and we consider it a bargain at the price mentioned.

BOUND BACK VOLUMES OF GLEANINGS.

IN moving a great stack of these we found that we have quite a quantity of volumes 1, 2, and 4, of GLEANINGS; Each volume is well bound together with brass clips. They are in a very convenient shape to read, and contain some excellent communications, besides many illustrations, volume 4 being fully illustrated on the cover, as some of the friends may remember. Now to get these out of the way, we will sell them, as long as they hold out, for 35 cents per volume, postpaid. They are for the years 1873, '74, and '76, respectively. If they are wanted by freight or express with other goods, only 25 cents per volume.

OLD BEE-JOURNALS AT 3 CTS. APIECE.

WE have bushels and bushels left yet, dear friends, and many of them contain very valuable articles from some of our best contributors. They are also illustrated with engravings that cost hundreds of dollars. Now, we are glad to let you have them at 3 cts. apiece, and we will sort them, also, so that no two are alike. But we can not very well sort out special numbers here and there, at this very low price. Perhaps the better way would be to send about the money you want to expend on them, and we will forward them, no two alike—that is, providing you do not send for more than about \$3 00 worth at a time.

SINCE the article on page 89 was written, we have received, through the kindness of W. P. Henderson, "Huber's Natural History of the Honey Bee." On the first page are some most excellent steel-plate engravings, colored, of the queen, drone, and worker. In fact, I doubt if there is any thing so good in any modern work on bee culture. Underneath the cuts is the following: "A new edition, with a memoir of the author, and appendix. London: Printed for Thomas Tegg, 73 Cheapside, 1811." The appendix is by Peter Huber. Is it not possible that there are some descendants of Huber still living? The maiden name of Huber's wife should have been printed Lullin, instead of the way we did last month. We had to "guess" at it.

IN C. C. Miller's remarks in regard to narrow sections without separators, he discussed Heddon's crate against the wide frames; and although he does not say so, I presume he means to include all other crates, as well as Heddon's style of crate. Our own crate, figured in our price list, which we have sold for years, has always been furnished with separators or without, as customers prefer. We can also make them, with very little trouble, with narrow sections, to be used without separators. To do this, we make sections about 1 11-16 inches wide, and thus get 8 rows of sections instead of 7—or 32 sections to the case. All the change needed is to have 8 bottom-bars to the case, instead of 7; and any case already in use can be easily changed over, if narrower sections are found preferable. For the present, the price of these narrower sections will be the same as the regular width—1 1/2 inches.

WHAT MAN HAS DONE, MAN CAN DO.

OUR reports in the "encouraging department" are encouraging in this way: They show not only what one *man* has done, but they show what many boys and women have done, and that, too, with but little experience. It is true, they had the teachings of the A B C book, or some other manual or journal; but the fact that great numbers report having made a good paying result, even from a first season's work, and often with only a single colony for a start, points unmistakably to the fact that thousands can gain the needed outdoor exercise, and take recreation in the open air, without the probability that it will be a dead loss of time. It also demonstrates that there are localities scattered here and there all over our land, where bees may do splendidly. Though these reports, as you will observe, seem to be confined to no particular State or climate, they are to me exceedingly encouraging, and I thank God over and over again as I read them. Not only do they tell of health and happiness, but of the bountiful rewards for the labor that has been bestowed; and through it all there seems to be a spirit of thankfulness to the Giver of all good.

SEND IN YOUR ORDERS NOW.

THERE is a letter on my table now from a friend who accuses me of being the means of causing him to lose his honey crop, because his order was delayed 15 days. He admits it was sent us in the height of white-clover bloom. Now, friends, there is a moral here. If you wait till white clover is fully in bloom, I can by no means agree to be responsible for the consequences of delays of 15 days, or twice that, for that matter. Our price list, since it was first published, has notified you that we could not be responsible for delays on orders received during the honey months. If you order now, however, we can usually send the goods with reasonable promptness. Will it not be best to have things ready long before the honey season commences? Of course, we shall do our best to be prompt at all seasons. We have stock of almost every thing likely to be needed, stacked up in our new rooms, and in the warehouse, equal to all that will be wanted during the season—or, at least, we think so. There is going to be trouble on sections again, for we can not get our basswood seasoned during the winter months. We have a fine stock of beautiful sections piled up in the warehouse; but the way they are moving off, they can not last very long. Better send in your orders pretty soon, if you do not want to be troubled by delays.

FOLKS THAT WON'T ANSWER.

BEFORE me are two letters—one from a gentleman, and one from a lady, and both most vehemently protesting against the measures we take to make people answer. We had written to both of these people at different times, through a period of over six months, without getting a word in reply; but finally, when we took measures to make them reply, they "talked with a vengeance," I assure you—especially the lady. Now, friends, will you please listen a moment to reason? We have deal now with more than ten thousand different people, scattered all over the world. When any one of these ten thousand is owing us, and does not pay, we write him to know what the trouble is. If he replies either by remittance or by explanation as to why it is inconvenient to pay, we seldom have any hard feelings or trouble. By the way, one feature has developed here that is to me a little singular. People who answer letters, always pay; and this rule has so few exceptions that our clerks have instructions not to crowd anybody who replies promptly every time he is written to. It seems to me there is quite a moral lesson here. One who feels anxious about his good name is always willing to take the time to protect it; but one that would just as soon defraud his fellow-men as not, does not often take the pains to reply. I do not mean to say by this that all people who do not reply are dishonest, but only that they are certainly very unwise. Well, now, as our book-keepers must have some regular rule to go by, they are instructed, when they have sent three statements, and get no reply, to make inquiries of the person, of some one else. I know it is not pleasant to have people inquiring about your responsibility. But, what else can we do? Can you suggest any other means for us to get along with business? Of course, you may say, "Stop trusting people." But with the varying prices of things, how can we avoid balances either one way or the other? and who would want some goods he was needing badly, held because his money lacked a little? The gentleman and lady I have spoken of both said they were intending to send the amount due when they made another order. Now, this would have been perfectly satisfactory, had they just penciled the one brief sentence on a postal, in answer to our statements. How are we to know what you purpose doing, if you don't tell us? In other words, why do you not "say so," and thus save all this trouble, lengthy correspondence, and unkind feeling?

Bee-keeping in Texas!

Any one wishing to engage in bee-keeping in an excellent location and healthy climate, can now invest with small capital. I have for sale an apiary of 20 colonies, in good condition, with extra hives, fdn., extractor, honey-kegs, and all appliances for profitable bee-keeping, near a good market. My reason for selling is, that I can find no one to take charge of the apiary. For description and terms, address
 WM. L. STILES,
 3d 714 Congress ave., Austin, Texas.

HEDDON'S CIRCULAR

Can be had by sending your address to

VALUABLE ORIGINAL PATENTS.

The Original BINGHAM Bee Smoker

BINGHAM & HETHERINGTON UNCAPPING KNIFE.

PATENTED MAY 30, 1879.

Patented, 1878.

Prof. Cook, in his valuable Manual of the Apisary, states that "Mr. Bingham was the first to improve the old Quinby smoker by establishing a direct draft." Five years of persistent effort has demonstrated that no one but Bingham has been able to improve a Bingham smoker. Hundreds of Bingham smokers have been in use five years, and are yet in working order. They burn lots of blocks and chips and stuff, and make lots of smoke and comfort, and have no dampers or match-box attachments, as they never go out or fail to blow smoke up or down or sidewise, much or little, swift or slow, just as you please, any or all the time; top up or down, they always go!

Bee-keepers will save money and vexation by buying genuine Bingham smokers and Bingham & Hetherington Uncapping-Knives first. We neither make nor handle any other supplies; but of these we are the original inventors and only legal makers, and have had over forty-five thousand in use from one to five years, and receiving but one letter of complaint.

With European and American orders already received for over three thousand, there is evidence that 1884 with us is not likely to be an idle one. Also that such goods as we make have met the advanced wants of the most advanced bee-keepers in Europe and America.

For mail rates and testimonials, send card. To sell again, send for dozen rates to

BINGHAM & HETHERINGTON, Abronja, Mich.

WAX

DADANT'S FOUNDATION

is asserted by hundreds of practical and disinterested bee-keepers to be the cleanest, brightest, quickest accepted by bees, least apt to sag, most regular in color, evenest, and neatest, of any that is made.

It is kept for sale by Messrs. A. H. Newman, Chicago, Ill.; C. F. Muth, Cincinnati, O.; Jas. Heddon, Dowagiac, Mich.; Dougherty & McKee, Indianapolis, Ind.; Chas. H. Green, Berlin, Wis.; Chas. Hertel, Jr., Freeburg, Ill.; Geo. W. House, Fayetteville, N. Y., and numerous other dealers.

Write for samples free, and price list of supplies, accompanied with 150 complimentary and unsolicited testimonials, from as many bee-keepers, in 1883. We guarantee every inch of our foundation equal to sample in every respect.

CHAS. DADANT & SON,
Hamilton, Hancock Co., Ill.

3td.

DUNHAM COMB FOUNDATION.

We have bought a large stock of choice yellow beeswax, and can furnish Dunham Comb Fdn. for brood comb, cut to any size, for 48c. per lb. Extra thin and bright yellow fdn. for sections, at 55c. per lb. We will guarantee our fdn. to be made of pure beeswax, and not to sag. Will pay 30c. per lb. for yellow wax, or will work it up for 10c. per lb. To induce our customers to order fdn. early in season, we will allow 8% discount on all orders received before the first of March. Address orders at once to

KIND WORDS FROM OUR CUSTOMERS.

The 10-csapes fit exactly, and the shears are excellent for the price. A. DEWEY.
Marsfield, Pa., Feb. 1, 1884.

The A B C is a beauty, and I am well pleased with it. HENRY M. KELLER.
Burlington, Ind., Jan., 1884.

The A B C is a better book than I expected for the money, and that Clark smoker is "just boss." H. J. SHAPLEY.
Copapa, Lorain Co., O., Jan. 25, 1884.

I received the 50-cent back saw I sent for in due time. I was surprised to get one so good for the money. J. J. WILSON.
Hamilton, Ohio, Jan. 25, 1884.

I like GLEANINGS ever so much. I always feel more like doing as I should like to be done by after reading it. J. S. CUMMINGS.
Brooklyn, Iowa, Jan. 31, 1884.

OUR 25-CENT BEE-KEEPER'S HAMMER.

Hammer is received all right; am more than pleased with it. I do not know but I shall send for another. G. H. HOYR.
Otisco, N. Y., Jan. 17, 1884.

I sent you the names of four new subscribers for 1884, and you sent them the Dec. No. It is all right, but it is more than I expected. I have received the A B C as premium, and am more than pleased with it. The 11 cents my due I intended as postage on the book. W. E. TURNER.
Ulysses, Pa., Jan. 6, 1884.

The A B C came all O. K. It is certainly the best work on bee culture for beginners and the experienced that ever was published. Although I have had eight years' experience in handling bees, I find something new almost every time I peruse its pages. It should be in the hands of every bee-keeper. J. M. YOUNG.
Three Groves, Neb., Jan. 30, '84.

CLEAN SEEDS.

I received the alsike seed all in good order and full weight. I was surprised to find it so clean and free from weeds—something uncommon, in this part of the country at least. It is a pleasure to give an order when it is filled so promptly. A. J. HAYNER.

[Friend H., we are trying hard to have our seeds, all of them, always like what you got. But it is a pretty hard matter. We are now talking about a seed-house with the latest improved machinery for cleaning our seeds, and proper arrangements for testing them.]

I am pleased with the moral tone of your periodical. "We be brethren." I quit smoking Sept., 1881; quit for conscience' sake. Yours in Christ, JOSEPH K. RANKIN.

Charlotte, N. C., Jan. 8, 1884.

[Friend R., may God bless you for your kind words. Your text, "We be brethren," awoke a pleasant thrill, although it was some little time before I recognized it with the help of the proof-reader. I am quite sure it would not hurt us to use such words oftener; and then when you came to that re-

mark about the reason why you gave up tobacco, I felt like saying, "Thank God, friend R. We be most truly brethren indeed."]

FRIEND WORTH'S BASSWOOD-TREES AT LOW PRICES.

Allow me to say in GLEANINGS, that I purchased a large lot of basswood-trees of Mr. Worth, of Bordonia. They came in excellent order, and gave the best of satisfaction. J. VANDERVORT.

Laceyville, Pa., Feb. 5, 1884.

[I am glad indeed to hear that friend W. understands taking up and shipping basswoods, for no one can confer a much greater boon on the bee-keeping world just now than he who encourages and helps to make the business of basswood planting a success.]

The Clark smoker and seeds received all right. Goods received from your house are the best packed I ever saw. I wish I lived nearer, so I could get all the modern appliances in bee culture. But at the present high rates in freight, it will not pay me to do so. Freight on my extractor to Cincinnati, \$1.00, and from there to Lake Weir station, \$1.42. GLEANINGS comes promptly, and every number gets more interesting and instructive. Wishing yourself and that baby-boy—for whom I have quite an interest, mine is some older—a bappy new year, I remain,— MRS. BELLE MCMAHAN.
South Lake Weir, Marion Co., Fla., Jan. 2, 1884.

I have kept bees for over 30 years in very many kinds of hives, and have never found one that suited me until I got the Simplicity. I am pleased with that, and all its fixings. I have used them for over two years. My bees have done well in them. We took from them, last summer and fall, 400 lbs. box honey, and 150 of extracted, and might have got much more if we could have attended to it as we ought. My son-in-law, Hiram Denton, lives with me, and has the care of the bees mostly. We have taken GLEANINGS for over two years. We watch for it as a cat does for a mouse, and it is read from beginning to end. It is all right—just what we want. Nicholville, N. Y., Jan. 14. HOSEA CARR.

A HOPEFUL LETTER.

The two glass cutters are replaced to Mr. Alden. I am glad you did it, for I am anxious that your reputation shall be just what you want it to be, and I am satisfied your clerks are trying to do right too. If every one I deal with would treat me as you have done, I should be a happier man; but I have found every bee-man whom I have had dealings with, willing to do right. Some of them have offered to overstep the bounds of justice to themselves. Bee-keeping is calculated to moralize any one who will engage in it, if not Christianize them. Vanceburg, Ky., Jan. 9, 1884. M. L. WILLIAMS.

[Friend W., I had to laugh when I read your kind letter, and remarked to the proof-reader that you must be like the chap who always got among such good neighbors, that I have been telling the children about a few pages back.]

I admire the business part of GLEANINGS, and like our Homes very much, and pray God they may be seed sown on good ground, as I think there is great need for the spread of the good news, and many will read our Homes who would neither attend worship nor take a religious periodical. I am away off in North-western Iowa, on a new place, and am short for means, but in good cheer. I am a one-handed man, and make my own hives, frames, etc. I built the house I live in—a frame, 12-ft. possis. How many one-armed patrons have you?

Correctionville, Ia., Jan., 1884. J. M. PORTER.

[Friend P., I can not say how many, but I know there are several, for I remember hearing them tell how they managed bees with one arm. Friend Robertson, of Pawama, Mich., one of the most successful bee-men among us, is a one-armed man, and it is said he does more work than most men do with two good hands. He opens hives, handles bees, and does every thing.]

SEED POTATOES!—Send for my price list of new and standard varieties. Address L. F. DITTELMANN, Belleville, St. Clair Co., Ill.

DADANT'S FOUNDATION FACTORY, WHOLESALE. See advertisement in another column. 301td

Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

CITY MARKETS.

NEW YORK.—*Honey.*—After the dullness around the holidays, the market opens up bright and active; although the prices are kept low, we think there will be a fair demand until May, and this is just what we want to see, as our market is well stocked. We quote:

Fancy white 1-lb. sections, paper boxes	20c
" " 2-lb. " glassed	16@17c
Fair " " " "	14@15c
" " 1-lb. " no glass	16@17c
Fancy buckwheat, 1-lb. secs., no glass	14@15c
Ext., clover and basswood, in kegs or bbls.	8½@ 9½
Extracted, off grades, in kegs and barrels	8@ 8½

Beeeswax is in good demand at 35@37c. for prime Southern; West India and Cuban at 31@35c.

THURBER, WHYLAND & CO.,

Feb. 9, 1884. Rcade & Hudson Sts., New York.

ST. LOUIS.—*Honey.*—We have no improvement in honey market to note since our last. Extracted, very dull in barrels; some little retail demand in small cans, say from 1 to 2 gallon. We quote in barrels, 7 to 7½c; in small cans, 10c. retail. Comb, only a retail demand, unless at very low prices. Retail, 1-lb. sections in good order, 16c. White clover would bring 18 to 19c, if in nice order, and no combs broken. 2-lb. sections, from 13 to 15c.

Beeeswax, not much arriving. Yellow, 75 to 37½c. Very little dark on the market; nominally about 32 to 33c. Look for higher prices.

W. T. ANDERSON & CO.,

Feb. 9, 1884. 101 N. Third St., St. Louis, Mo.

CHICAGO.—*Honey.*—Comb honey is being taken in a small way. Prices are without change of special note for the best grades; off grades are slow at almost any price. Extracted honey, 7 to 10c.

Beeeswax scarce at 30 to 36c. per lb.

H. A. BURNETT,

Feb. 8, 1884. 161 South Water St., Chicago, Ill.

CLEVELAND.—*Honey.*—Has been quite dull the past two weeks, but prices unchanged. Best white, 1-lb. sections, 18 to 19c; 2d quality, 15 to 16c; 2-lb. sections, best, 16 to 17c; 2d quality, 14 to 15c. Extracted, no sale.

Beeeswax—Nominally 30c., but none offering.

A. C. KENDEL,

Feb. 9, 1884. 115 Ontario St., Cleveland, O.

KANSAS CITY.—*Honey.*—Demand for choice white comb, 2-lb. sections, is good, and stocks extremely low. Large lots would find ready sale at 17 to 18c. Dark comb not wanted at all. Extracted in fair demand for tall honey at 8 to 8½c. White and candied none not salable.

Beeeswax.—None to quote.

JEROME TWICHELL,

Feb. 8, 1884. Honey Depot, 514 Walnut St., K. C.

BOSTON.—*Honey.*—No change in price of honey.

BLAKE & RIPLEY,

Feb. 9, 1884. 57 Chatham St., Boston, Mass.

FOR SALE.—One barrel of clover honey, 10c. per lb. net. Free on board cars here.

I. Y. KEZARTEF,

Ceresco, Calhoun Co., Mich.

I have about 5500 lbs. of nice white-clover and basswood honey, in kegs and barrels, for which I will take 9c. per lb., delivered at R R depot, package thrown in.

T. W. LIVINGSTON,

Ainsworth, Washington Co., Iowa.

BEST SUPPLEMENT FOR 1884.

Watch free to everybody who will send me an order for ½ doz. tested, or 1 doz. untested queens. The world-renowned Waterbury watch and one queen, only \$4.00. Watch alone, \$3.50 by mail. I think I now have the very best strain of bees that have ever been offered at so low a price. It is just the bee that attracts everybody's eye; viz., for beauty, pleasure in working, and large yields of honey. Everybody wants them. Italian tested queen, in April, \$4 to \$6; May, \$3 to \$4; June, \$2.50 to \$3.50; July and after, \$2 to \$3. Untested, in April, \$2; May, \$1.50; June, \$1.25; July and after, \$1. Albinos and Hol-Land queens, my favorites, ¼ more than Ital.

Dealer in scales, comb fdn., Simpson honey-plant seeds, or roots; 70-cent smokers, canary birds, brown Leghorn eggs, \$1.00 per 13, and U. S. honey-extractors. Wax wanted, 10% off on all orders before April 15th. Send for circular.

For Sale!

A COTTON, GRAIN, and STOCK FARM,

Situated on the Guadalupe River in DeWitt County, Texas, containing 1000 acres, 450 inclosed, and 200 in cultivation. An excellent location for a large apiary. Price \$10,000. Correspondence solicited.

J. A. WIMBISH,

4tf-d-b

Cuero, DeWitt Co., Texas.

BEEES. - BEEES.

SPRING PRICES:

Italians, - - - - -	\$9.00
Blacks, - - - - -	8.00

All in Modest 1½-story hives, frames 10½x11½. Will work wax up to sizes 12x12 or 9½x17½, for 15c per lb., or one-third the wax.

C. J. SANFORD, : UNIONVILLE, CONN.

THE ALL-PURPOSE HIVE.

Arranged for continuous passage-ways, continuous combs, no honey-board, no bee-space, chaff and single-walled, no patent. Sample in flat. Given fdn., sections, etc. GEO. F. WILLIAMS, 2-3-4-5-6-7d New Philadelphia, Ohio.

MAKE YOUR OWN FDN.

My foundation-molds have given good satisfaction for 3 years. 5 to 20 feet to be used and praised by leading bee-men. Price \$3.75 for L. size, or 12x12. Circulars free. OLIVER FOSTER, 3btfd Mr. VERNON, Linn Co., Iowa.

COMB FOUNDATION.

Having purchased a large stock of choice yellow wax, we shall make a specialty of this branch of our business this season. We also offer general apianian supplies. Also a choice lot of Italian and Albino bees, bred from our new strains, which gave such good satisfaction the past season.

Send for our price list, and state where you saw this. Wm. W. CARY & SON, Coleraine, Franklin Co., Mass. 4btfd

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

A TIMELY ARTICLE.

AN EXPERIMENT IN PRODUCING WAX.

WAX is higher, and threatens to go higher yet. The question forces itself into prominence. Can we produce wax with bees kept especially for the purpose? and what does it cost, if produced that way? I ran one of my best colonies exclusively for wax last year, and herewith make returns of the result.

The colony selected was one of a family of colonies that had attracted my attention by rapid and excellent comb-building. Started them off May 4th with 12 Gallup frames in a chaff hive. Three of the frames were empty, except narrow starters of foundation, and these were interspersed with the frames of comb, the middle one dividing the brood-nest. Whatever comb was made in these three frames was cut out regularly, before eggs had time to hatch in it. Three days later I made my first cutting of wax. There were four pieces, one of them drone and the rest worker, eggs in both, no honey, one cell only of pollen. The weight of this cutting was somewhat less than $\frac{1}{2}$ oz. The colony on the scales was bringing in from 2 to 4 ounces of honey and pollen per day. I soon learned that once in four days was often enough to cut. The amount obtained at a cutting increased until it sometimes amounted to a whole ounce. The largest amount built, up to that date, was while the untimely snow of May 21st lay on the ground. Not enough honey came in during May to have them put any in the new comb; and the pieces would have been nice for starters, and to fill sections with, had I not wanted to melt them up

so as to be precise about the amount of wax. May 29th the amount of comb harvested was very small, and they were building queen-cups. June 1st they had built nothing but queen-cells on the starters. Several subsequent examinations showed the same results. June 11th I fed them 3 lbs. of broken honey at the entrance, to induce them to build again. They still refused to build, and, nine days after, swarmed.

The operations of May furnished me with four items of information. 1. Cold weather does not necessarily stop the building of comb. 2. A desire to swarm does stop it. 3. The maintenance of three empty spaces through the hive does not, even in connection with short supplies of honey in the fields, prevent swarming (the total runs of the scale hive for the whole month of May aggregated only 7 lbs. 9 oz.). 4. Feeding does not always eventuate in wax. When they won't build, they won't. At the outset I had put in something over six pounds of honey in the frames of comb.

Comb-building recommenced shortly before the colony swarmed. I suppose they wanted some wax to commence with in their new home; and having got it secreted, they used some of it in their old quarters. The bees that remained at the old stand also built a little before the second swarm emerged. The second swarm was lost—not lost to the apiary, but lost to the experiment, by mixing up with other bees. The aggregate runs of honey in June, as shown by the scale hive, figured up 22 lbs., or nearly three times the yield of May; and yet I got less wax. This was owing to swarming on the brain, I suppose. The old stand continued rather remiss in

comb-building to the end of the season; but the new colony got to business building comb, and putting honey in it (and pollen too, sometimes), so that my regular harvests in July were, figured in ounces, 2, 2½, 2, 3, 3½, 5, 9, 3, 2. These figures were somewhat too large, as appeared when the wax was melted up; but they serve to give a general idea of the secretion. About 5½ lbs. of honey was taken with the wax. Wax was taken in the same way from the second colony as from the first. I had hived them on combs infested with drone brood, taken from a colony afflicted with fertile workers; which perhaps was not treating them fairly. The runs of honey for July, as per scale, amounted to 25 lbs. 5 oz., only 3 lbs. 5 oz. more than in June. This shows, again, that the amount of wax produced does not always correspond to the amount of honey brought in.

There is chance here for a little computation, although of a very rude sort. The colony may have secured more honey than the colony on the scale did; and the wax cut at the old stand was not kept separate from that of the colony that was doing most of the building; but we shall not be very far off the track to say, that on an income of 20 lbs. of honey, over and above what was taken away from them, the bees in this hive made a pound and a half of wax during the month of July. On the very wild supposition that they turned half their honey into wax, a pound of wax is the equivalent of six and two-thirds pounds of honey. On the much more reasonable supposition, that one-sixth of their honey was used in wax secretion, and five-sixths in brood-rearing and for their own nutriment, a pound of wax represents about two and a quarter pounds of honey.

On the 18th of August my new colony swarmed; and August 29th it gave an after-swarm; so I then had four wax-building colonies. These late swarms I managed in a different way. The after-swarm was allowed to have but one frame of comb, and the other one only two combs. Every bit of comb they built was cut away. This was pretty hard on the future prosperity of the colonies, as they could not raise much brood, for want of comb to raise it in; but it made them "scratch gravel" finely in the business of comb-building. Of course, the way to close up the season would have been to unite these late colonies with the two earlier ones. I regret to confess that I was slow in getting around, and did not realize how soon they would be coming to want; and when I finally looked to them, the weaker colony had all died of starvation, and the other one not choosing to "die and make no sign," had swarmed out and gone off. This loss should not be charged to the experiment, but to the carelessness of the experimenter.

Well, the grand total of wax from one colony and their increase was by weight, 3 lbs. 15 oz. I "allowed" that I had wasted about an ounce in various ways, and called the result an even 4 lbs. The amount of honey taken with the wax was 11 lbs. It so happens that 11 lbs. per colony, spring count, was just the average of my whole apiary. This particular colony would very probably have produced more than 11 lbs. of surplus had they been run for honey, however. Nobody to my knowledge had a good yield in this vicinity last year. In fact, those I know definitely got about nothing at all.

The ten pounds or more of honey I gave my wax colony in the spring must be mentioned. I don't think it increased the yield of wax materially; and

at any rate the swarm that was lost may be called a fair "stand off" for that. With a better season, and the experience I have gained, I think I can do better on another trial.

It is well known, that estimating what can be produced by a whole farm from one hill of potatoes or corn is a very unreliable computation; but sometimes such estimates have a certain value, if we eat a sufficient number of grains of salt with them. To figure on the present brood of chickens, 100 colonies, run with equal success, would yield 400 lbs. of wax. This at 33 cts. would be \$132.00. The honey, 1100 lbs. (pretty green), at 7 cts. would be \$77.00. The increase of 100 colonies would be \$ (?). The total income from wax and honey amounts to \$209.00; not very much for a season's work; but still, people have done worse. If the fellow should winter with a loss of not over 20 colonies, and sell the odd 80 for a fair price, he would make the year's ends meet nicely. But right there, my countrymen, is a "piut" where the apiarian shoe pinches.

E. E. HASTY.

Richards, Lucas Co., O., Feb. 2, 1884.

Friend Hasty, I am very much obliged indeed for the result of that experiment, although I must confess I am greatly disappointed at the result. I expected you would get about 25 lbs. of wax from a single good colony, working that way during a good season, instead of a paltry 3 lbs. 5 oz. However, if your whole apiary averaged only 11 lbs. of honey per colony, it is, as you say, not so very surprising. How many colonies were there in your field, pray? Well, even if it does not pay to run colonies exclusively for wax, at the present price of wax it certainly pays to save all the bits; and one of the chief charms of business to me is the necessity of being saving of every little bit that may be converted into something valuable.

THE NEW FACTORY.

THE PLACE WHERE WE LIVE, AND MINISTER TO THE WANTS OF THE BEE-KEEPING PUBLIC.

IS not the picture a nice one, friends? I thought the one we had in 1878, when we first came down here by the railroad, was just about as nice as any thing could be. But our friends Murray & Heiss, of Cleveland, O., who did the work on the engraving we present you, fairly outdid themselves this time, so it seems to me. I sometimes feel like rubbing my eyes, and wondering if it is really possible that God has blessed my boyish plans and projects so that this building is a reality, and not some transient dream. The old building was 100 feet long by 40 feet wide, and the boiler-house down opposite the lumber piles made it a little longer than the 100 feet. The new wing was made to run out 85 feet, so the front is 125 feet long, all together, and as I sit here by the compositors' table and look away back through the clerks' office, it seems like looking down a lane, almost, or up a street. Suppose you take a look inside with me. Let us go in by that door near where the man stands with a load of bee-hives. Eliza has got stands each side of the door, as you see, on which to place new goods that come into the counter store, or old goods as they be-

come seasonable. Inside we have a room about 40 x 60 feet, entirely occupied by the counter store. The counters inside, instead of being in a circle, as in our old room, are made in oval form, having entrances to go behind the counters on each end and at the middle of each side. In the center of the oval is a stairway that leads to the basement. This stairway is generally occupied by Caddie and her cousin Mabel, where they sit on the steps and cut paper dolls, with Eliza's shears which they have borrowed. This whole south side of the counter store is occupied by shelves. The large vault for valuables is in the corner, at the right. Not only has every article in our price list got a place provided especially for it, but a label is pasted in the bottom of the box, giving the name of the article, and telling where the stock is kept, if it is not directly under it under the counter. For instance, one article reads, "Stock kept in the safe;" another one, "Stock kept on next top shelf opposite."

At the left end of the counter store, where the two counters open, we come to the lunch room. Here you will find oranges and tropical fruits, received from bee-friends in Florida, and also little pies, doughnuts, etc., from the kitchen below. One side of the lunch-room is occupied by a pyramid of the Jones honey-pails, a little like what we saw at the Toronto exhibition, on a small scale. Interspersed are also glass honey-pails; and if you go through into the lunch-room you will see honey in 10-lb. cans, nicely arranged on the shelves. This room is the dining-room. At 12 o'clock every day it is filled with pleasant tables surrounded by boys and girls, chatting and visiting merrily and happily, for milk and honey is one of the staples of the lunch-room.

Near the outside door, where you see the sign just back of that basswood shade-tree, we have cases of comb honey nicely displayed. On top of these cases of comb honey are a lot of little paper boxes made so as to hold just one section. Here is a picture of one.

PAPERBOARD CASKET FOR 1-LB. SECTIONS.

When anybody wants a section of honey, Mrs. Shane just pulls out the flap that you see at one side, raises the lid, as it were, slips in the section, closes it up, and

hands it over to the customer. We have quite a nice little trade on honey put up in this shape. You see, the purchaser can take hold of the ribbon and trudge along, envied by beholders, because he has got such a pretty little package. If he chooses, he can have a Jones honey-pail in the other hand. Well, well! we must get along, or we shall never get through the factory.

Let us go back where the little girls sat cutting paper doll-babies on the stairs. "Look out, little chicks, that we don't step on you. Hadn't you better sit so that folks can go up and down? and do you remember, Caddie, what papa said about putting every scrap into the waste-basket when you get through?" Down here is the tin-shop,

friends. Honey-pails? To be sure, we have to have a good many for our work. Mr. Gray said, that when we got into this new tin-shop we were going to have things in order. So he made great bins up against the whole north wall, the whole length of the building, and three tiers high. Then we commence with honey-pails, or tin boxes, rather, holding $\frac{1}{2}$ lb. The next bin contains $\frac{1}{2}$ -lb. pails, and so on, until we get up to pails holding 25 lbs. each. We keep such a quantity in these bins, that, if we get an order for 1000 in a single day, we often fill the order right up, and have some left. After we get up to the 10-lb. pails, we have pails with covers, holding 25 lbs., 50 lbs., and the flour-cans, holding 100 lbs. Besides, we have a great variety of different sorts of pails—raised-cover pails, Jones's improved screw-top pails, japanned and lettered pails, then extractor-cans; 300 or 400 are now made up ready for next season's work.

To get in the tin for all this work, we have a little railroad running through the basement, and right out into the little brick entry-way where you see that large arch opening. The tin comes down our side track, on the cars; the boys then run it off on their trucks into the arched doorway, then it goes down on a shute through a trap-door, and is landed on the car that carries it into the tin-shop.

Our friend "Ned" is the tinner. He has been with us a good many years. In fact he used to be one of the little boys who helped in the tin-shop: now he has whole charge of the tin work. You can sit on that car, if you wish, and be pushed out into what we used to call the "dark-room." As you go by, if you look through the window you will get a little view of the kitchen where the pies are made, and dinner is gotten up. After the noon service the dinner is sent up into the lunch-room on a dumb-waiter. To-day we had honey for dinner, sent as a present from W. J. Ellison, Statesburg, S. C.

If we go a little beyond the kitchen, a turn to the right brings us into the wax-room. About 12 hands are at work there now, and we are beginning to use up wax at the rate of a ton every few days, even though it does cost from 35 to 40 cts. per lb.

Beyond the wax-room, Mr. Gray is fixing an arrangement for melting honey by steam. He takes a whole barrel, rolls it on to the platform over a large tin reservoir. The head is then removed, and the honey runs slowly out all around the steam-pipes. When melted, by opening the honey-gate the honey runs quickly into the pails placed on a spring scale which registers the proper amount very quickly.

Beyond the honey-room is the 50-horse-power engine; and still beyond this, the boiler and the boiler-room, where our friend "Park" shovels in the coal, and looks after the steam-pipes which warm the building, warm our house, and drive the engine. Within a few days we have put in an automatic arrangement which takes the sawdust and shavings away from the planers and buzz-saws, and shoots them into the fire under the boiler in a sort of spray, something like

the playing of a fountain. The blast of air helps get up the heat; the shavings are blown in so loosely that they burn very quickly, so the engineer is spared a great deal of hard work, and a great amount of fuel is saved by the extra supply of oxygen furnished.

Turning again to the left, we come into the machine-shop. Four men are now at work there making buzz-saw mandrels and comb-mills. Orders for fdn. mills are coming in at an unusual rate, for the scarcity of wax is inducing many bee-men to hold on, or gather up all the wax in their vicinity, and then get a mill to make their own. Machinery for hive-making is also in great demand, and never before were so many buzz saws wanted, and buzz-saw mandrels. We now order saws by the hundred, of a single size, and in a few weeks we have to order again. Our buzz-saws are stored in one of the vaults, each size having its appropriate peg; and as the notions about saws are almost as diverse as those about hives, we have to keep something like 40 or 50 kinds in stock, sizes from 4 to 16 and 18 inches. In the same room where the mandrels are made, we make the honey-gates for extractors, fit up the gearing, make smoker-springs, besides doing the usual repairing of the establishment.

A little further along, our genial friend Mr. Spafford is crating hives. He puts ten in a package, and keeps doing it day after day. We have something like 4000 Simplicity hives now crated, ready for shipment. But I just told Mr. Gray I didn't believe it would be half enough, for we often send out 100 in a day.

Going on beyond Mr. S., we come to the dark-room again, where the railway track and trap-door are, which I have told you about. Going up a flight of stairs we come into the packing-room, where our friend Bert has four or five men all the while packing things in boxes, and nailing them up. When inspected and put up, they are run on trucks out of the arched doorway, right into a car that stands close to the platform.

Adjoining the packing-room is the saw-room, which occupies the whole first story, from the engine-house up to where you see the horse and buggy hitched. From 15 to 20 men are usually employed in this room. Further to the right, where you see the lady with the parasol, is the room containing the large press, and beyond that is the room for storing the paper for printing GLEANINGS and the price list. This is now purchased in lots of two tons at a time, and is run on trucks from the car right into the double doors, in front of the lady before mentioned. A little further along, where you see those three girls, is the entrance to the lunch-room. The sign reads, "Home of the Honey Bees Lunch-Room."

We have now been all through, except the upper story. On the corner where you see the window raised a little, is the printing-office, and this extends out a distance of ten windows to the right. It is before, one of these windows, the sixth, counting from the left, that I am sitting, dictating this item to the proof-reader, who is a short-hand writer

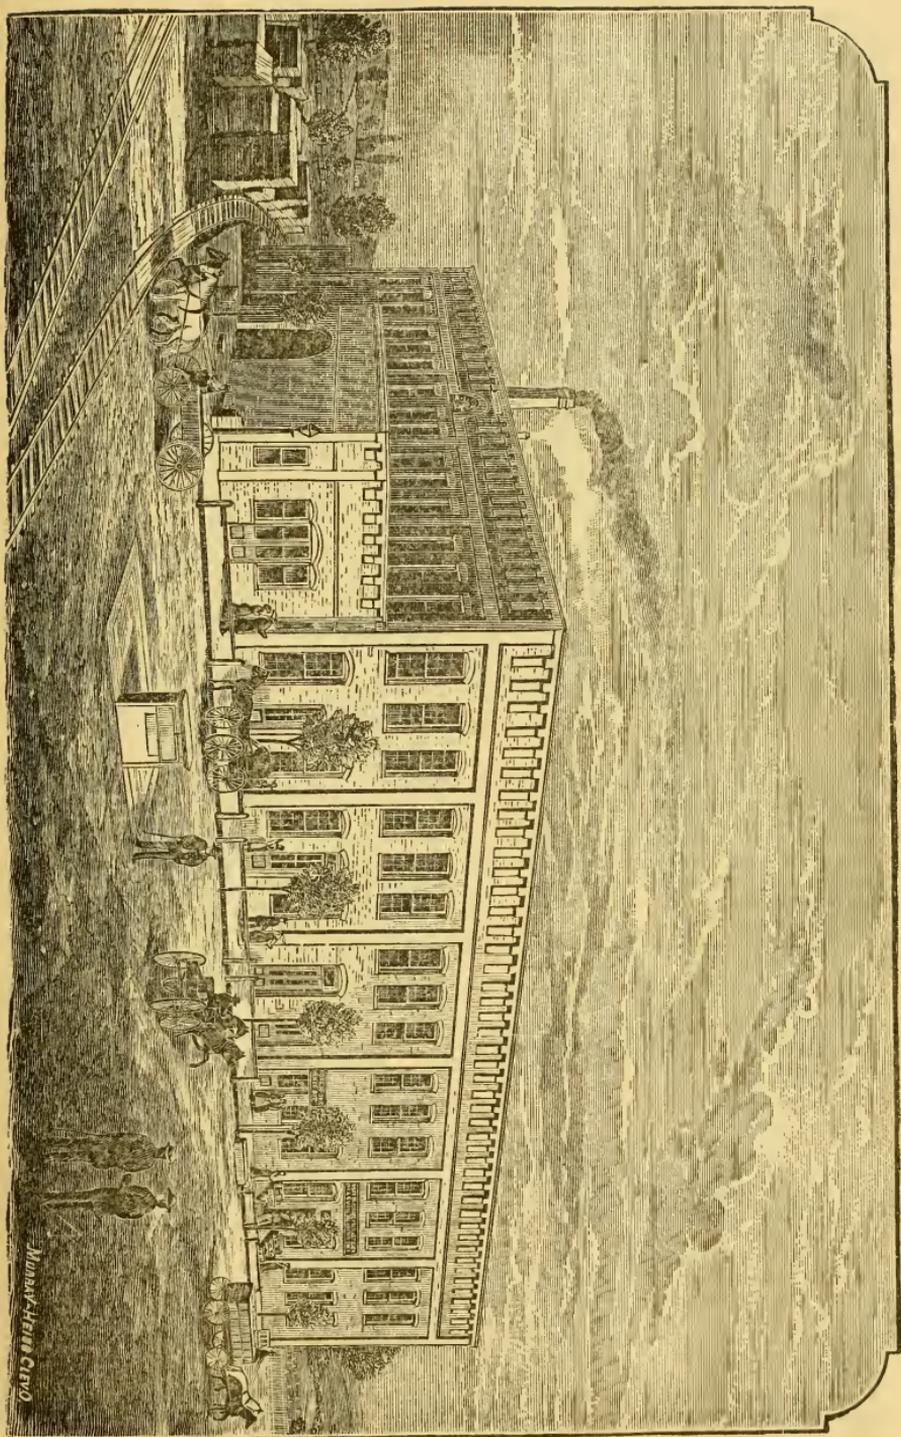

as well as a printer and compositor. Beyond that is the office, where I hear the girls chattering now. I presume they do not see me anywhere around. Just back of the printing-office is the folding-room, where the journals are folded and cut, and the A B C's are made. In this room we have a paper-cutter that is heavy enough to cut your big Webster's Dictionary all up into little slices, if you should ever want to do it. Back toward the engine-room is what we call the sample-room, where frames for bee-hives are stacked up in such quantities that we could probably fill an order for 100,000, and have some left then. Here at each side of a long table, several girls are at work tying up goods ready for shipment by mail, express, and freight. They handle seeds, feeders, transferring implements, tinned wire, metal bars, sections, honey-crates, and every thing of that ilk. At the left of this room, in my old office, where we have a small tin-shop for making the inside of extractors, and fitting them up together. Our friend Merwin has charge of this room now; but when he gets crowded, "Jane" has to help him. It is a little funny, I know, but Jane can make more extractors (or, rather, the insides of extractors) in a day, than any man tinner that we have ever found. If there is anybody who thinks women are behind in industrial and mechanical arts, he had better come and make us a visit. It is true, we have some work that men can do, and women can not very well do; but we have a good deal, I tell you, that the women do nicely, and that men could not very well do, if they tried it ever so hard.

Beyond the extractor-room is the room where the smokers are made, and where we keep our seeds. After the tin work is all prepared, and the boards are made, the girls make the smokers for 5 cts. apiece, cutting out the leather, gluing up the bellows, and all that. Some of you who think you can put a smoker together yourselves cheaper than the girls can, had better try it.

Beyond the smoker and sample room is the paint-room and japanning-room. But before going in there, I want to tell you our seed-room won't begin to hold the seeds, and so we have got a sort of seed-house, or granary, outside, set upon stoneware tiles, so the rats and mice can't bother us.

I think now we have been all through the factory. Right before the lunch-room is a stone watering-trough, where the horses and dogs can quench their thirst. It is supplied from the old well I have told you about. When the new building was added, we felt bad to think the well stood in the way; but we finally put the well in the cellar, had a pretty pump attached, with stone pavement around it, and now it is the handiest place in the world for the boys and girls and visitors, or anybody else, to get a drink right from the "old oaken bucket," or rather, a new chain pump, come to think of it. An ingenious arrangement is attached to the pump in the lunch-room, so the overflow goes into the watering-trough, which keeps it always full, without anybody pumping in.

Only a part of our lumber piles is shown; in fact, only a very small part. The track,

THE HOME OF THE HONEY-BEES IN 1883.

Murray-Harris Co. Clevo

as it disappears behind the building, runs into a large warehouse for storing lumber, seeds, and goods of all kinds. I used to have a pretty garden on one side of this railroad track, but now, alas! it is all covered up with pine and basswood lumber, and the garden will have to go over to the right of the factory, where our new house stands. Don't you think it is a rather pleasant place to live? I am inclined to think a good many think that way, for applications for places from both boys and girls are now beyond any thing heretofore known. It seems to me as if everybody wanted to work here. May be they wouldn't like it so well, though, after all, for some seem to think I am awful strict. May be they will think just as much of me for all that, however. There, if there is any thing I have not told you, write, and I will tell you something more.

In regard to applications for employment. Letters are coming every day, wanting a place with us; and the book-keeper just now tells me that 86 are booked already; therefore it would be of little use to book any more, for we shall not, in all probability, get through with the 86 for the year to come. I am inclined to think there is plenty to do at home, friends, if there is only a mind to do it; and if there is not, you surely wouldn't like it here.

SHALL WE BUY BEES, OR BUY SUGAR AND "MAKE" BEES?

SOME INTERESTING QUESTIONS TO THOSE BUILDING UP AN APIARY.

CAN I take two-frame nuclei this spring, give them laying queens, and with the aid of part, ly drawn combs and full sheets of fdn. (no brood from other colonies) as needed, and stimulate feeding, build them up into strong colonies by the time white clover comes in bloom, so as to get a honey crop this year?

How early should I begin?

How warm must the weather be to begin feeding for this purpose?

Would a chaff hive in a house be an advantage over the same outdoors?

Would a frame half the length of a Simplicity frame, with the same depth, be a decided advantage over full-size S. frame? I could eventually transfer two into one.

Would a hive built to contain two or more nuclei be an advantage?

The above questions are asked with the understanding that the closest attention, chaff cushions, chaff hives, chaff division-boards, the A B C, GLEANINGS, and all the common sense I have will be used in order to succeed.

I want more bees this spring, and I think buying sugar is as cheap a way to get them as any, when you have not much money to spend, if my idea is practicable. If I can not get them strong enough by white-clover bloom, I would prefer increasing in the natural way. If I can get them started by the first of April I have sixty days to work in, to the first of June. Will that be enough? I fed for brood-rearing last fall in Sept., Oct., and Nov., and had brood as late as the middle of Nov.—the amount of brood

increasing from the first to the middle of the month, after which the weather was too cold to look at them, and to-day they seem none the worse for it. They were outdoors until after we had 22° below zero, then I overhauled them one warm day, and put them in the cellar, fearing to trust the weather further.

Cumminsville, Ohio.

E. CLOE.

Friend C, you can build up two-frame nuclei without a bit of trouble, in the way you suggest; and if you were an old hand at the business, and knew just what to do, and how to do it, I should say you might commence the first of April. Of course, a good deal would depend on what the two-frame nuclei were. If like those described in our price list, they ought to be pretty fair colonies at the time white clover blooms.—If they are in chaff hives, with chaff division-boards each side of them, you could begin feeding without any trouble the first of April.—Whenever the day is warm enough so the bees can fly freely, I would take the cover of the chaff hive off and let the sun shine directly on top of the burlap which covers the cluster, letting it dry out and warm up the inside of the hive; then replace the cushions and cover as soon as the night air begins to make it chilly.—If you were an old hand at it, and could afford the expense of carrying the nuclei into the house, or better, a warm cellar, during cool weather, you could go to work in March.—A frame half the length of the Simplicity would give some advantages when the colony was small; but as it would be a disadvantage just as soon as they got tolerably strong, I do not think it would pay to use it. I would not have any frame in the apiary, except the regular Simplicity, and I would not have more than one nucleus in a hive. There are some advantages, but it complicates matters, and is apt to make confusion.—I have given the above answers, under the impression that you are a new hand at the business, and I would not advise you to try very many to commence with—say five or ten. The principal difficulty will be to get good strong nuclei by the first of April, without paying pretty nearly the price of a full colony. Perhaps you might get them from some of the friends in the South. You probably would have to get your queens from the South, any way. I do think your plan a very much better one than to buy bees, and sugar is so cheap now that an expert ought to be able to make a splendid thing of it by raising bees to sell, and feeding sugar before they begin to get natural stores. There is danger of dysentery in feeding during such cool weather as we are likely to have in March and April. Since we have been having such trouble with foul brood, I am more and more convinced, that with the low price of sugar, bees can be raised ever so much cheaper than they can be purchased. We do a large business in selling bees, as you know; but almost every time they go off, I feel as if the purchaser, if he has any time at all on his hands, could raise them very much easier than he could afford to pay for them. Sixty days ought to be ample time for an expert to build a two-frame nucleus up in to a strong colony. I should be very glad to get a report from you, friend C., to know how you succeed.

SELLING EXTRACTED HONEY.

FULL INSTRUCTIONS IN REGARD TO A PLAN THAT
WILL DO IT EVERY TIME.

THE following we copy from the *Country Gentleman*, by permission of the writer, our old friend W. Z. H. It was written in answer to a letter sent friend H., asking how to get rid of 3000 lbs. of honey that did not seem to sell of itself:

My experience, which has been mostly with extracted honey, teaches me that a really superior article of honey for table use can not be obtained unless it is left in the hive until sealed over and thoroughly ripened, and in this view I am supported by such men as the Rev. L. L. Langstroth, James Heddon, Chas. Dadant, and many others.

Knowing the above facts, no man possessing common sense would expect to enter a grocery where extracted honey had never been handled, and effect a sale at market price. I tried it many times when first starting in the business, and almost invariably was told that the grocer did not believe he could handle honey in that shape. If I had some in the comb he would buy it, have steadily and gradually developed my home market, until it takes all the extracted honey that I raise; but, if I had a few thousand pounds more than I could sell near home, I think that I should not ship it to commission men to sell at 7 to 10 cents per pound, less freight and commission.

This may be the best, and in fact the only course for many bee-keepers, for the reason that selling is not their forte. To raise a good crop is one thing, to sell it at the best advantage is another; hence, bee-keepers who are poor salesmen should either raise comb honey, or be content to allow other men to sell their honey. My own peddling skill was developed by several years of "canvassing" for different articles, and if I had a large crop of honey to sell, I should send myself out in the capacity of a "drummer." I should put the honey up in tin pails varying in capacity from 1½ pounds to 5 pounds; allow it to crystallize; adorn the pails with neat labels, and also labels explaining in regard to the crystallization, how to restore it to a liquid state, etc. I should make boxes large enough to hold even dozens of each size. I should also make enough neat little stands, upon which to expose the honey for sale, so that I could furnish each dealer with one. Honey must be placed in a position where people will see it, otherwise many do not think of buying. I should make these stands of the "knock down" order, so that they can be taken to pieces and packed in the first box of honey shipped to a dealer. After getting the honey all in readiness for shipment, I should take a large valise, put into it one of the honey-stands, enough of the honey-pails to appropriately fill the stand, but they should all be empty, except one small one, on account of the weight in carrying them, and that should be filled with crystallized honey, just as I expected to sell it. All the pails, however, should be supplied with labels. I should also carry with me a bottle of the same kind of honey in a liquid state. I should select a route of such character that I could swing around a circle back to my home.

Upon entering a place of business, I should inform the proprietor that I was a bee-keeper in search of customers for my honey. If he did not know what I meant by extracted honey, I should explain, illustrating my remarks by taking from my valise a work upon bee culture, and showing him the engravings of movable-comb hives, honey-extractors, etc. After he fully understood what it was, I should show my liquid samples, allowing him to taste it, then explain in regard to the crystallization of honey, sustaining the truth of my assertions, if necessary, by reference to the "bee book," following this up by exhibiting the pail of crystallized honey. If he became interested, and would allow me to do so, I should now put together the honey-stand, place it upon the counter, and, arranging the shining tin pails, with their bright labels, upon the stand, call his attention to the attractive appearance of the pails thus arranged upon a stand upon his counter. After the talking and explaining is all over — and an immense amount is required — it is barely possible that a sale can be effected, but ten to one the reply will be: "I don't know whether I can sell it or not; I guess I will not buy any to-day." The only thing that can

now be done is to ask permission to send a box of honey to be sold on commission. This will seldom be refused, and the dealer should be informed in regard to the objections that customers will urge against the honey. In fact, he should be as fully "posted" as it is possible to make him in a single conversation. The dealer must be educated, and, through him, the people. An extra pail of honey should be placed in each box, and the dealer instructed to take it home and liquefy it, use part of it (so that he will know that it is good, and recommend it), and bring the remainder back to his place of business and keep it in a glass vessel, such as a jelly-tumbler. Thus customers can be shown how the honey appears and tastes after it is liquefied. This is quite important. To build up a trade in this manner for extracted honey, requires an immense amount of talk, patience, and perseverance, but I know that it can be done.

In three or four weeks after shipping the honey, the dealers should be again visited, when it will be found that there are many points upon which some of them wish to be enlightened. One customer has said one thing, another a different thing, and so on. A few have sold very little honey, others half of it, a few perhaps all that was sent. After making two or three trips it may be possible to conduct the business by correspondence. Every bee-keeper who wishes to raise extracted honey should send to Chas. Dadant, Hamilton, Ill., for his pamphlet on harvesting, handling, and marketing extracted honey. It costs little, but is worth \$10. Mr. Dadant has handled 45,000 pounds of extracted honey in three years, and tells how he did it.

Genesee County, Mich.

W. Z. HUTCHINSON.

Very likely some of the friends will object to the above, by saying that it is too much trouble. Well, if you can not take the trouble you will have to sell at a low price, or let it stand unsold. I know by experience that friend H. is exactly right about it, and that such a course will ultimately build up a home market that will sell immense quantities of good extracted honey.

SOMETHING MORE FAVORABLE FROM THE ZINC HONEY-BOARDS.

DO THEY RESTRAIN QUEENS, OR DO THEY NOT?

I HOPE no one will give up the idea of using perforated zinc, on account of the unfavorable reports that have appeared in the two last numbers of GLEANINGS. From my own experience, I know that it can be used with perfect success. I work almost entirely for extracted honey. My hives are the common two-story Langstroth, with a slat honey-board between the upper and lower stories. The honey-boards are made of four slats, with a cleat on each side, leaving a space about 2 inches wide between each of the slats.

When the honey season opened last spring I put perforated zinc honey-boards, instead of my slat honey-boards, on four of my strongest hives of Italians. I filled the upper stories with empty combs, and a few frames of brood from below. The bees worked through the zinc with perfect freedom. But here comes the trouble. The hives were made for ½-inch honey-boards, so there was a space half an inch wide between the bottoms of the frames in the upper story and the zinc honey-board. Before long, the upper frames were fastened down so solid that it was almost impossible to get them out. Then, again, when I wanted to look into the lower story, the zinc honey-board was fastened down so tight that I had to bend it all out of shape to get it off. Before long the queens began to appear in the upper stories. The cause was not far to seek. The zinc honey-boards were just the right width; but they

were just the same length as the inside of the brood-chamber.

The queen, after filling all the space below, crawled in on to the rabbit, between the ends of the frames, and so got around the end of the zinc honey-board. As I said before, the honey-boards to my hives have four slats. The two end ones are 6 inches wide, and the two middle ones are 4 inches wide. That leaves three spaces about 2 inches wide for the bees to work through. Instead of putting four slats into the honey-boards, I left out one of the middle ones. That gave me a honey-board with two spaces each 5 inches wide, instead of three spaces each 2 inches wide. Then I took my zinc honey-boards and cut them into strips 6 inches wide, and tacked them over the spaces in the honey-board. Then I had a honey-board that fitted the space between the upper and lower stories, so that the bees never fastened the upper frames down. The honey-boards did not bend out of shape, as did those made entirely of zinc. And above all, they fitted down on to the edges of the lower story, so that it was impossible for a bee to get into the upper story without going through the perforated zinc.

What was the result? Not a queen got into the upper story, where these honey-boards were used. But the bees worked just as well as if there had been no honey-board there.

On page 12, GLEANINGS for Jan. 1, Mr. Hutchinson objects to perforated zinc, on account of its cost. The perforated zinc costs me about 16 cts. per square foot, counting express charges from Medina. I use just a square foot for each honey-board. The honey-boards cost almost nothing, as I buy them in the flat with my hives.

In conclusion, I would say that perforated zinc honey-boards, as you sell them, are almost useless. But perforated zinc, if used in the right way, is a perfect success. XEN. CAVERNO.

Lombard, Du Page Co., Ills.

Friend C., it seems to me your whole trouble was caused by that large space between your upper and lower frames. In all the hives we make, this space does not exceed $\frac{3}{4}$ inch; and in place of a honey-board, we use a mat. This, of course, just allows room for the perforated zinc, and yet no place for them to build in combs. In fact, one thing for which they were particularly designed was to prevent the bees building the upper and lower frames together. Very likely a honey-board of wood would be better where the space is so great as you have it.

PEA-VINE CLOVER.

ITS CULTIVATION, ETC.

IN response to many inquiries, Neighbor H. gives the following further facts in regard to the cultivation of pea-vine clover:

Sow in the spring on a wheat, oat, or barley crop, or any place you would sow any kind of grass. Be careful not to sow too early; wait till after the hard frosts are over, as the young plants are tender. A hard freeze will kill them, but they will stand a light frost that would kill corn or potatoes. It makes an excellent quality of hay, as it matures the same time as timothy. You do not have to cut timothy

before it has matured, to save your clover, when they are sown together for mixed hay. For pasture, it can't be beat, as it does not hurt it to feed it down, as it grows very rapidly, and will keep green all summer. It is the cheapest feed for hogs that can be raised, as they will fatten on it without any other feed, so that butchers like to buy them for the early market. But be careful not to turn on too early in the spring, while the ground is soft, as it injures the crop, especially if you turn on heavy stock like horses.

It is a good plan, when you have a good start in the spring, to pasture it through May, as the hay will grow finer, and the seed mature better, and you will always have bulk enough; or if you do not wish to pasture it, you can run the mowing-machine over it the latter part of May. There will not be any thing worth raking up.

The seed must be saved from the first crop (it is not like the June clover); the seed will be ready to cut the fore part of August. I cut it with a side-rake reaper, let it dry in the gavils; don't rake it with a horse-rake, as it shells very easily. I like to thrash it as you draw it out of the field, when it is dry, as it gathers moisture, and gets tough, and the seed does not hull so easily after it has been stacked.

Thrash with a common clover-huller. Besides being a first-class forage plant, you get a good crop of honey right through the hottest, dryest part of the season, after alsike, white clover, and basswood are gone, and bees have very little to work on, so it will pay any bee-keeper to try it.

H. B. H.

Medina, Ohio, Feb. 5, 1884.

EXTRACTED OR COMB HONEY.

WHICH KIND SHALL WE WORK FOR?

IN page 99, current volume, this question is asked by Mr. T. Wm. Fleming. The editor of GLEANINGS asks for a "free pitch-in" to an answer. If ever I have to take 8 cents per lb. for good extracted honey, consumers will never find any. Comb honey at 15 cents will pay better than extracted at 8. There can be no trouble to make a sale of the comb honey at this price; but extracted goes off slow with most bee-keepers at 8 and 10 cts., and there is some uncertainty about its ever being so extensively called for as to warrant bee-keepers turning much attention to its production.

This trouble generally grows out of the great distrust on the part of the public as to its real character. It does seem as though the general public would never come to know or believe that candied, or granulated honey, becomes so because it is pure honey. Even if it should be regarded as pure by all, it is unattractive and uninviting, even at the low price at which it is offered. Were I compelled to ship my honey long distances to find a market, I would perhaps prefer to produce extracted honey at one-third less price than comb, for the reason that it is shipped with so much less risk of loss. Indeed, I am not sure I should ever locate in a country where I could not have a home market for most of my honey at paying prices. What matter if a man should with great labor, perseverance, and skill, produce a large crop of honey, and for want of a good market, or cost of putting his product into a market, find in the end that all this energy and hard work had left him but a meager salary? Fortunately in these days of cheap and rapid transportation

there are not many places where honey can be produced and not find a good market.

It seems to me I should have to be getting an immense quantity of extracted honey, if I could not get more money out of it than 8 or 10 cents per lb. Here we have what might be called a poor honey country, and can not average more than 60 lbs. per colony, of comb honey, fair seasons. Last spring I got from 55 colonies, spring count, no increase, 4100 lbs., one-half comb in 1-lb. sections, and sold comb honey at 20 cts., and extracted at 16 to 22 cts. This would average 20 cents; but it is not every bee-keeper who will work his crop off at these prices. Not only my own honey have I sold, but several thousand pounds purchased from other producers.

Friend Fleming speaks of having 98 colonies to begin with, and of their swarming so much, which indicates that the season with him was good; but for his locality, having such an abundance of blue thistle, clover, etc., his crop of surplus should have been, with proper management, much greater. Perhaps that 600-acre farm stood in the way of the bees. Last fall, in company with Mr. K. M. Reynolds, of East Springfield, Ohio, I visited some of that blue-thistle region, taking in the Shenandoah Valley, Va. While there we discovered a peculiarity of the bees of the valley. In the town of Winchester there are one thousand colonies of bees, and hundreds more kept within a radius of two miles of that town; and although they all gather enough to keep them, and give perhaps an average of 40 lbs. per colony, surplus, the bee-keepers there tell me they seldom swarm. Now, while this seems to be the case down in the valley, on the mountains on both sides of the valley the bees swarm with a vengeance. We visited the town of Front Royal, at the base of the Blue Ridge, and saw some very fine honey that had been gathered there perhaps from the neighborhood of friend Fleming. The honey from blue thistle is of very fine flavor, and the Shenandoah Valley and vicinity abounds with this best of all honey-plants.

J. A. BUCHANAN.

Holliday's Cove, W. Va., Feb. 4, 1884.

Friend B., a few days ago we had company, and my wife picked out a nice section of comb honey. This honey was found over a swarm of bees I purchased in the middle of the winter. The owner was too lazy to take off the honey, I suppose, and so he sold me the colony, bees, honey, and all. The honey was basswood. My wife says she does not like basswood, but she liked this. So did I. The bread was nice, the butter was rich and yellow, and a pitcher of milk and a goblet stood near my plate. After I had taken several chunks of the comb honey, I dipped up the liquid honey with my spoon. Now, if the extracted comb honey that stood in the honey-cup right near was as good as that I dipped up with my spoon, it would not have been on the table week after week untouched, comparatively. Is not the extracted honey at 8 cts. generally a little inferior to that from sections that have been allowed to ripen over the hive? One would infer from the above, that you are a comb-honey man. I agree with you, that it does seem as if there were something wrong, when nice extracted honey brings only 8 cts., and comb honey 15 cts. It seems to me there must be some misapprehension or misunderstanding, when such a state of affairs comes about.

MRS. LUCINDA HARRISON OFFERS A FEW SUGGESTIONS AS TO WHO SHOULD KEEP BEES.

MILK AND HONEY AND SUNSHINE.

BROTHER ROOT:—Womanlike, I want to put in a word as to "who shall keep bees." Any one who wants to, and who can prevent them? I thought when I read friend Hutchinson's paper (the blue one) that he had dyspepsia. He has been writing a good deal, and the weather has been very cold, so that he could not exercise freely in the open air. I want to prescribe for him: A bath once a week, and a diet of graham gems, honey, and fruit, and he'll come around all right. We shall soon hear him whistling, as he trundles the twins around his apiary.

Brother Clarke had a similar attack, but the veterans all know what caused it—he got stung on the lip.

I write some for farmers, and I tell them all to keep at least a few colonies of bees, to provide their families with a pure sweet, wax for their wives to wax their thread to sew on their buttons, and last, if not least, to fertilize the bloom of their orchards and meadows. But I never in my life told a doctor that he could make more money keeping bees than practicing his profession. Once upon a time I called in the services of an "M. D.," and I found out how they can coin money (not honey).

If only specialists kept bees (it might be better for that class alone, who then could afford honey? The bee-master of the London *Times*, Dr. John Cumming, did a good thing in inducing cottagers to cultivate bees in England and throughout the British empire. Let us imitate his noble example, although we may lose money thereby. Is it not a grand work to show people how they can provide themselves with a pure sweet, which is wasting at their own doors, "which is to be had, not for the asking, but for the taking"? And we will also be adding to the wealth of our native land, of which we all feel proud.

The supply dealers, who are furnishing good implements for the apiary, have my hearty thanks. I should like to see good movable-frame hives, and other fixtures of the apiary, hawked around the country by wagon loads, stopping at every farmer's door. I know I don't like to see supply dealers at bee-keepers' conventions getting a resolution passed to give a vote of thanks to Mr. So-and-So for his smoker or drone-trap; but let them bring their wares, the more the better, and give plenty of recesses, so they can button-hole everybody there, and fill their pockets with circulars.

As old men, women, and invalids, are not considered proper persons to keep bees, I should like, if there are any such, that they would "speak out" in meeting, and relate their experience, for the benefit of doubting Thomases.

MRS. L. HARRISON.

Peoria, Ill.

Well, I declare, my good friend Mrs. H.. I have thought several times before, that you had the peculiar gift of hitting things right squarely, and doing more in a few words than some of the veterans do in whole columns and pages. And it seems to me this is a good stopping-place; for if we do not stop, GLEANINGS, both old and young, will be occupied, during the year 1884, with essays on "Who shall Keep Bees?"

The "Growlery."

This department is to be kept for the benefit of those who are dissatisfied; and when anything is amiss, I hope you will "talk right out." As a rule, we will omit names and addresses, to avoid being too personal.

THIS time it is not an individual, but it is a convention of individuals, it would seem, and we find it in the *Syracuse Standard* of Jan. 24. At the head of the article we read, "Action taken by the North-Eastern Bee-Keepers' Association. We extract as below:

Mr. Benedict said that A. I. Root, publisher of *GLEANINGS IN BEE CULTURE*, has proclaimed that his journal has 150,000 readers. The speaker said that Mr. Root will give some article he has to sell an editorial puff. Five thousand readers will think that the article is a good thing, and will send Mr. Root a dollar apiece. Mr. Root will be in \$5,000, and 5000 hard-working men will be out a dollar apiece. In the speaker's opinion, Mr. Root and his magazine are hurtful to bee-keepers.

A member said he did not believe that the magazine has more than 6000 subscribers. Several members expressed opinions uncomplimentary to Mr. Root and his *Gleanings*.

Now, friends, it seems to me that is naughty. We have never had 150,000 subscribers, "nohow," and I am sure I never thought or said we had 150,000 readers; and, by the way, my good friend Benedict, is not your logic, on the face of it, spiteful just a little bit? If those articles which I so wickedly offer for sale did not cost me "ary red," and every one of our 5000 readers (by the way, how did the readers shrink down to 5000 so quickly?) bought them at a dollar apiece, it might be true. It seems to me the remarks are the more unkind and thoughtless, because I have, almost since the commencement of *GLEANINGS*, given the exact number of subscribers in every monthly issue. If the friend who made the above remarks is a subscriber to *GLEANINGS*, he would have seen that our number in the January number was given at 4275. I believe that our purchasers are usually satisfied that the goods they buy of me are sold at a very small profit, instead of costing nothing and selling at a dollar. And another thing, I believe *GLEANINGS* has always been ready to advertise any good thing that comes up, no matter who made it or where. It is true, I have very often added, after a description, that if the friends wished, I would get the articles for them at such and such a price, and perhaps I have really illustrated too many wares in this way that I have had for sale, or perhaps I have undertaken to sell too many things. In extenuation, let me illustrate it by the following letter that was in my hand when I picked up the *Syracuse paper*. It is in regard to Sturworld's case for exhibiting and selling honey, illustrated on page 11. When I illustrated this case I spoke of its good points, and did not say a word about making them or having them for sale, as some of the friends complain I have so often done. I was not surprised, then, when queries began to come in like the following:

What is just such a show-case for honey as Sturworld's worth, as illustrated on page 11 of the January number? Do you intend to make them?

JOHN W. NIMAN.

Spring Mill, Richland Co., O., Jan., 1884.

Now, our friend is not unreasonable. He knows that I could have the cases made by the dozen or hundred, for perhaps half what it would cost bee-keepers to have them gotten up singly, and therefore he with others would like to have me do it. Were it possible for me to compass so many things, no doubt I should be doing them a favor and a kindness by getting competent manufacturers to give us a price on them by the quantity. I admit, that my project of making manufacturers name a low figure for any thing that bee-keepers might want has been a successful one, and I thank God for having placed it in my power to help my friends and customers in just that way. Nevertheless, there may be some truth in the charge brought against me, and I will think it over carefully; for when people speak ill of us they often utter truths that our friends would hesitate to speak.

A GOOD LETTER FROM AN A B C SCHOLAR OF ONLY ONE YEAR'S GROWTH.

ALSO A GOOD SUGGESTION IN REGARD TO THE STURWOLD HONEY SHOW-CASE.

I AM a new subscriber to your journal. I commenced with the first number of this year. I am well pleased with your paper; besides, I think that I am already doubly paid my subscription price by the suggestions of friend Sturworld, of Hammond, Ind., in regard to making honey sell. I see from his article that he gives his plan to the bee-keepers of your particular family. I have adopted it, with a small improvement (I think); viz., below the show-case proper I have made a cabinet large enough to hold a 21-lb. case of comb honey, in a drawer that opens on the back side of case under the door, so that the grocer can keep his honey for retailing, free from flies, dirt, etc. You can give the above improvement, if it is one, to your readers.

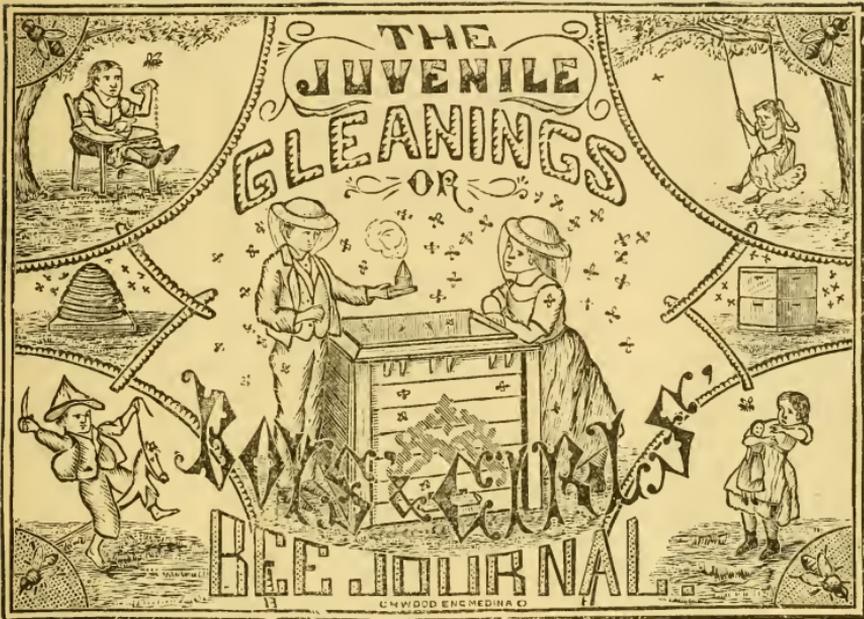

I notice in your paper the success of different bee-keepers, so I will give you mine. Last spring I transferred, from old log and box hives, 8 colonies, while the apples were in bloom. We had a very wet, backward spring after that, and I fed back 75 or 100 lbs. honey. My apiary increased by natural swarms to 19 colonies. As soon as white clover was in bloom I placed caps with section boxes with foundation in them. I have had very good success. I have sold \$100 worth of honey at 15c. per lb.; have had all the honey that we wanted to use on the table, and have 100 lbs. on hand yet, besides 250 partly filled sections. My outlay is, for section boxes and foundation, \$11.25. I made enough hives for my neighbors, so that I am out (besides my work) only 5 cts. for my hives. I had 12 swarms; doubled two of them when they came out; have lost one this winter; have two Italianized. All are in good condition Jan. 10. I made from one hive of black bees, 221 lbs. comb honey, in 1-lb. sections, but no swarms.

This is my first year with bees in the movable-frame hives. I will try feeding back honey (to finish up sections) on a small scale. I feel my way as I go, and try not to jump at conclusions.

Belle Prairie, Ill., Jan. 28.

ADAM CROUCH.

Your idea is an excellent one, friend C., and it begins to look now as if bee-keepers would have to prepare something of that kind to put in some suitable grocery or store near them. If they keep supplies, and have a sort of shop near the road, of their own, perhaps they might have such a case fixed up in the front part of this shop.

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

MYSELF AND MY NEIGHBORS.

Give, and it shall be given unto you; good measure, pressed down, and shaken together, and running over, shall men give into your bosom. For with the same measure that ye mete withal it shall be measured to you again.—LUKE 6:38.

MY LITTLE FRIENDS, I want to tell you a story I heard the other day, about neighbors. A good many years ago, when they did not have railroads as they do now, there used to be what we called "taverns" scattered through the country. They call them hotels now, but the country taverns then were rather different from a hotel. As the landlord had many times but a small amount of custom, he used to be a sort of farmer, and a good many times the country tavern was nothing but a great big farmhouse by the side of the road, without a town by it at all. Well, once there was an old Yankee farmer who kept a tavern by the roadside. I suppose you have heard that Yankees are a very inquisitive people. They always want to know what their neighbors are doing; and if a stranger comes along they are always curious to know who he is, where he is going, where he came from, what kind of business he follows, and all that. Well, this Yankee tavern-keeper was no exception to the general rule, and so he used to ask everybody who stopped with him over night such questions as I have mentioned above.

One evening a wagon full of people moving came along to stop with him over night.

After they got the horses unhitched, "mine host" began as usual:

"Well, neighbor, may I ask where you came from, and where you are going?"

"Why, I came from the town of —, in the State of Pennsylvania. I am going out west somewhere to find a new home."

After a little time our friend returns to the charge.

"Now, friend, if you will excuse the liberty I take, I should like awful well to know why you are moving away from the town of —; that is, if you don't mind about telling me about it."

"Don't mind telling at all; for the real truth of it is, we had such a pesky mean set of neighbors there in — that it was impossible for a decent man to get along with them and live. I am going to try to find a place where one can live and get along without being pestered to death by such mean, low-lived people."

Now, this tavern-keeper, besides being a Yankee, was also something of a philosopher; and after eyeing the traveler for a minute he advised him as follows:

"My friend, you won't find any better neighbors out west than you had where you came from. The world is all pretty much alike, and you had better make up your mind to put up with just about such people as you have left."

Now, by some queer sort of coincidence there happened another family along in a few days more, and of course our friend put them through the same line of questions; and.

strange to say, this man also came from the town of ———, in the good old State of Pennsylvania. When the landlord got to the question, "And why did you move away from ———, my friend?" he got the following reply:

"Why, my dear sir, I would not have moved away from ——— for any thing in the world, had it not been for some especial reasons which I need not now enumerate; for we had just the nicest lot of neighbors there that any one ever had anywhere. I have no hope that I shall ever meet such a good kind lot of whole-souled Christian men and women as we had there, and it is with feelings of sorrow and sadness that we broke the ties that have existed so many years, and start for a new place among almost entire strangers."

Now the face of our Yankee philosopher beamed with kindness and good will, and he broke forth:

"Look here, neighbor, you need not be troubled, or feel sad, for you will find just such neighbors in your new home as those you left behind. The world is full of them, for it is pretty much all alike. Our neighbors are as we make them."

Now, then, my little chicks, what sort of neighbors have you got across the way, and to the right and to the left of you — up street and down? Are they mean and selfish and quarrelsome and disagreeable, or are they like that good man I told you about last?

Give, and it shall be given unto you.

DILIGENCE IN BUSINESS.

ARRIVING at the years of understanding, every person finds himself in a position where he must soon decide what course he will pursue through life. The question of preference, whether he would be in this world or not, was not left for him to decide. He finds himself in the world regardless of his own wishes, and now come up the questions: How shall I pass away this life I find placed before me? how shall I live to find the most happiness for myself? how shall I live to be of the most use in the world? can I find the most happiness possible for me to enjoy, unless I live for the benefit of those about me? These are questions which come to every one, sooner or later, and in the deciding of them we make our future destiny, and have an influence either for good or bad. In deciding this matter, many seem to feel that, in gathering riches and honors to themselves, will come the greatest happiness. I think this a mistaken idea so far as it turns toward self and selfishness; but in getting riches to do good with them, and in doing that good, comes a blessing greater than which there is no other, except that which comes from having the love of God filling the heart. So, then, we have first, "Seek first the kingdom of God and his righteousness;" and second, a life of industry in doing what we can to make the world better for our having lived in it. As I do not propose to make this a religious epistle, I will not dwell on the first, except to say to those who know nothing of the love of God in the heart, that there is a happiness in knowing that you are one of God's children, far greater than any other happiness of this world. If you do not believe it, and can not see it in this light, it is simply because

the things of the "spirit are spiritually discerned;" hence if your heart is not filled with this spiritual love, you can not expect to enjoy it.

In our second we have a busy life, as giving us the greater happiness of any except the first, supposing that, if we gain more than is necessary to carry us through life, we are to use it for the good of those about us. As a busy life means "diligence in business," I have so headed this article. Many years ago it was thought to produce much happiness to be near and be commended by the king of the land. We think it an honor to see and shake hands with the president of our own United States. Those who attended the North American Bee Convention at Toronto, thought it an honor to shake hands with Father Lanstrot (I wish I could have been there, and had that pleasure), and so we find it always considered as giving happiness to stand before and shake hands with great men. Now, we have a promise in the Bible to the "diligent in business" which reads, "Seest thou a man diligent in his business? he shall stand before kings; he shall not stand before mean men" (Prov. 22:29), and thus we find the men whom the world delight to honor to be those who have, through diligence in their calling, become proficient in the same. It is a rare thing that I refer directly to my own life in any of my writings for publication; but to best illustrate what I wish to, I will give the juveniles a brief sketch of my life thus far.

I was born of parents in very moderate circumstances, who gave me an education such as was afforded by the district school. Till I was nearly 15 years of age my life was an aimless one. I went to school simply because my parents sent me, as perhaps some of you are doing who read this. At 15 years of age I believed I had "passed from death unto life," was baptized, and joined the church. At this time I began to wish for an education, but my parents now decided that I ought to help at home during the summer, while I was allowed to attend school for the next three winters. During those three winters my motto was, "Strive to excel," and to that I owe all the education I now enjoy, which is only that which is termed the common branches. I was brought up a farmer, father thinking that such was the avocation I should choose in life; and as I had not yet obtained a liking for the bees, I decided that father was right. After so deciding, I adopted the same motto as I did at school, and tried to put it in practice in all I did. After making some failures, falling short of excelling, I asked myself what was the trouble. I soon decided that I was expecting to reach the top of the ladder by trying to begin to climb at the middle, instead of the bottom. In other words, I was trying to accomplish a piece of work rapidly, without first knowing how to do it well, and the result proved a failure. I now decided, if I would excel I must first be willing to go slow and learn to do a thing well; and after so doing, learn to do it rapidly, without neglecting any part of it. Soon after thus deciding, I remember trying to shear the first sheep. For three hours I labored patiently to accomplish the job. When about half done, one of the men who was shearing at the same time tried to persuade me to give it up, and let him finish shearing the sheep; but I desired to accomplish what I had begun, so declined to be persuaded. I well remember the satisfaction I had in seeing that sheep go out of the barn, looking nearly as smooth as those sheared by those who were experts at it.

As time passed I soon was able to shear 20 sheep in a day, and do it as well as any one. This was considered a good day's work; but I was not satisfied till I could shear 40 in a day. I now went out shearing, and thus was able to get double the pay for three or four weeks during the sheep-shearing season, that I could get at ordinary farm labor.

I give this to show how *diligence* should be applied to our business; and also to show that, when so applied, it will always command a good price. When this price is received, we are happy in thinking we are efficient laborers in helping those about us. I might go on and tell how I mastered other difficulties till I became an efficient farmer; but this one will suffice. My next (in March JUVENILE) will be "How I Became a Bee-keeper."

Borodino, N. Y.

G. M. DOOLITTLE.

Friend D., you have struck upon just what I am sure all the juveniles at least will be glad to hear—what you did when you were a boy, and how you laid the foundation for your success in business of all kinds, as well as bees. I could have told all the little friends already, that one of your peculiarities was doing every thing well, and that if you could not have a good nice thing, and one that just suited you, you wouldn't have any at all. I wonder how many of our readers are able to shear forty sheep in a day.

SOME COMPOSITIONS ON BEES.

IT seems that the little friends in Allerton, Iowa, got it into their heads that they would write a piece giving some fact in the natural history of bees, or telling what they know about them. Accordingly, half a dozen or more have been sent in. We will give them all under this general head.

ANDREW'S COMPOSITION.

Bees are very strong; they can fly a great distance without alighting. The drone has no sting, but it makes a buzzing sound when flying. Bees will not work in the light. ANDREW E. HOLZER, age 11.
Allerton, Iowa, Jan. 15, 1884.

MATIE'S COMPOSITION.

Drones have no sting. They may be easily held without stinging. MATIE SMITH.
Allerton, Iowa.

HATTIE'S COMPOSITION.

Bees have a pouch in the back of their body, in which wax grows little by little. When it is full it sticks out in little scales, and either the bee himself or some of his fellow-workers take it off and use it in making honey-combs. At first the comb is white and soft; after a while it grows firm and yellow. Bees' eyes are made to see a great distance.

HATTIE CRUM.

Allerton, Iowa, January 3, 1884.

SAM'S COMPOSITION.

My father has 15 stands of bees; 13 stands swarmed this summer, and 2 stands died. We are going to sell them. This is my first letter. I will write you a better one next time. SAM GASTON, age 11.
Allerton, Iowa, Jan. 16, 1884.

WHEN THE BEES CAME.

Bees were not in this country till the white man settled here. The Indians call the bee the white man's fly. EUGENE HOLZER.

Allerton, Wayne Co., Ia., Jan. 14, 1884.

CLAUD'S COMPOSITION.

There were no bees in America until they were brought here by Europeans; but they are now found all over North and South America, although they did not reach South America till 1845, and California in 1850. The bees called the drones have no stings; but the females and the workers each have one at the back part of the body. The sting of a bee is where the poison is made. When a bee stings it first makes a wound with the sheath, along which the poison flows in a groove; and it then thrusts in darts to deepen the wound. Bee-poison is so deadly that a single sting will kill an insect. Animals and men have been sometimes killed by bees which attacked them in great numbers. The honey-bee is an insect of the order *hymenoptera*, or membrane-winged insects. The word bee comes from the Anglo-Saxon *beo*.

HOW CLAUD'S FOLKS GOT A START IN BEE-KEEPING; CLAUD'S HOME, ETC.

I live in Allerton, and go to school. Our school is in a brick building three stories high. I have gone to school four years. When school is out I go up to my uncle's and spend summer. One Sunday there was a swarm of bees settled on a cherry-tree, and we took a keg and hived them, and now we have three stands of bees. We did not get much honey the first year; but the second year we got 170 lbs. We have made more hives for next year.

CLAUD PHILLIPS.

Allerton, Iowa, Jan. 15, 1884.

MAY'S COMPOSITION.

The food of bees is of two kinds—the pollen of flowers, and sweet juices. The pollen is gathered on the hairs of the legs, and carried to the young. When the bee stings it first makes a wound with the sheath, along which the poison flows in a groove, and it then thrusts in the dart to deepen the wound. The saw-teeth edges are very hard to pull out, and bees are often hurt so badly they die.

MAY ALEXANDER.

Allerton, Iowa, Jan. 3, 1884.

Now, May, it seems to me that you and Claud have copied your ideas from the same book, for they read just alike. Would it not be better to get a fact fixed in your mind, and then express it in your own words? Always be original.

AN OLD BEE-BOOK.

FRIEND BURRELL, of New York State, sends us a copy of Daniel Wildman's book on bees, dated 1780. We quote from page 41. We copy verbatim:

The Drone is a large Bee without a Sting. Some are of Opinion that it is a working Bee that has lost its Sting; but this is erroneous, for no Person ever saw that a working Bee became a Drone.

Many Reasons are alledged to prove the Drone to be the Male.—1st. Because, notwithstanding they are great Wasters of Honey, yet the Bees suffer them to remain quiet till they leave off breeding, and have Conceived for the next Year.

It is evident, from the above and other passages, that friend W. supposed the worker bees brought forth young, and that queens perpetuated themselves only.

THE DISCOVERY OF SILK.

COMPILED AND WRITTEN BY MISS NELLIE LINCOLN ROSSIER.

Continued.

IN the meantime, the demand for silks had prodigiously increased, along with the wealth and luxury of the Grecian court, of the inhabitants of the capital, and other principal cities; and the Persians enriched themselves by carrying on that trade. This awakened the jealousy of the Emperor Justinian in regard to that branch of industry and commerce, and he determined to secure the same advantages to his own empire. His first step to this purpose was to send an express embassy to the kings of Ethiopia and Abyssinia, to invite them to appropriate to themselves the silk-trade, considering that they could obtain the silk direct from India, and had it in their power to send it to Alexandria through the Nile. The ambassadors explained the great advantages that would accrue from it; observing, by way of argument, that Christian sovereigns ought not to permit the heathen enemies of the emperor to enrich themselves at the expense of his subjects. These suggestions had, however, not the least success, and the autocratic sovereign of the great Roman Empire in the East failed to procure for his subjects, the silk-trade. A mere chance produced what no exertion had been able to effect, and it gave a new face to every thing connected with that industry, and occasioned the production, fabrication, and trade of silk in Europe. Two monks presented themselves at the court of Constantinople, and offered to reveal the secrets of the rearing of silkworms, which they had learned during their missionary expedition in China. The emperor, in his joyful surprise, made them rich presents; but it seems that the friars possessed only some seed of the mulberry-tree, and considered themselves thereby completely provided, because they thought that, when the trees should grow, "the worm could not fail to accompany them," as in China. But this was a hasty conclusion; and the monks being encouraged by the many splendid promises of the emperor, returned to China in search of silkworm eggs, "though the exportation of them from that empire was punished with death." They got back to Constantinople in safety, toward the beginning of the year 555, and brought the precious eggs with them, concealed in their hollow pilgrims' staves. Nothing was now wanting to the success of the new industry. According to Byzantine authors, the eggs were hatched by heat of manure, and this process is still followed in parts of some countries. As soon as the mulberry-trees began to bear leaves, they served to feed the worms.

In Greece, too, noble ladies were the first to attend to the rearing of the worms, with the assistance of their servants and their children, and encouraged and extended the culture and the fabrication of silk throughout the whole country. Under Justin II., the successor of Justinian I., ambassadors from Sogdiana declared that the Grecian silk was, in no respect, inferior to that of China, and highly complimented the emperor upon his success. Silk was at length produced in such abundance that the emperor Alexius, as it is related by his daughter, Anna, the historian, "distributed, in the year 1005,

*Anna Commena. See Gibbon, in regard to the merit of her history.—THE TRANSLATOR.

on the eve of a battle with the Scythians, among those of his soldiers whom he was unable to provide with armor, helmets and breast-plates of iron-colored silk."

SOMETHING FURTHER FROM THE SOUTHERN EXPOSITION.

THE BEE-HIVE, AND SOME BEES THAT OUR FRIEND FREDDIE CRAYCRAFT NEGLECTED TO TELL ABOUT.

FREDDIE CRAYCRAFT wrote a very nice description of the great Southern Exposition, which was held at Louisville last fall; but I did not see any mention of the wonderful hive of bees that was on exhibition. They fairly outdid the Cyprians and Syrians, for they were not only in full blast after dark, but they actually swarmed at 10 o'clock at night. As to their disposition, it was so fiery that the exclamation of the Irishman who got stung by a honey-bee might have been very well applied to each of them: "Och! murthor, how hot his little foot is!"

But to lay aside joking, I will tell of them. When the daily papers announced that, in honor of the bee-keepers' convention, there would be shown in the fireworks exhibition a piece entitled "Busy Bees," I was very anxious to see it. So when the sky-rockets began to fly, and the blue lights and Roman candles to blaze, I hastened out into the park and secured a good position to see the "Busy Bees." In due time that particular "piece," as it was called, was ready to be fired off; and in order that my young friends who have never seen an exhibition of fireworks may understand, I will say that the "pieces" which are intended to represent different objects, or mottoes, consist of great numbers of little Roman candles, lights of different colors, pin-wheels, squibs, and other kinds of fireworks, arranged on a framework of wood, and raised ten or twelve feet from the ground on posts. Well, the pyrotechnist stepped up to one of these, touched a light to the quick-match that ran down the post, and immediately there was seen a streak of fire running up the post, and all around over the framework, lighting up innumerable little blazes that burned steadily in every color, and made a very good picture of an old-fashioned straw skep, with the motto under it, in large letters of fire, "*By Industry We Thrive.*" Just at the entrance of the hive, little squibs were continually falling and darting here and there, as they went toward the ground. It was a perfect representation of a hive of bees in full blast. After this scene had lasted some little time, suddenly it seemed as if the hive opened, and the little fiery bees swarmed out in great numbers, just as honey-bees rush from a hive. They shot up into the air, of all colors and sizes—blacks, Italians, and Cyprians; drones, workers, and queens, darting to this side and that, and I rather think that even drones of this variety of bees would sting considerably, if you should happen to catch them in your bare hands.

When it seemed that enough bees had swarmed out of that skep to fill several Simplicity hives, there was a loud explosion, a dozen sky-rockets shot up toward the heavens, and as a battery of Roman candles began to pop, pop, pop, near by, the wonderful bee-hive was gone, and nothing remained to tell of its brief existence but a wreath of blue smoke floating away through the trees.

W. C. PELHAM.
Maysville, Ky., Jan., 1884.

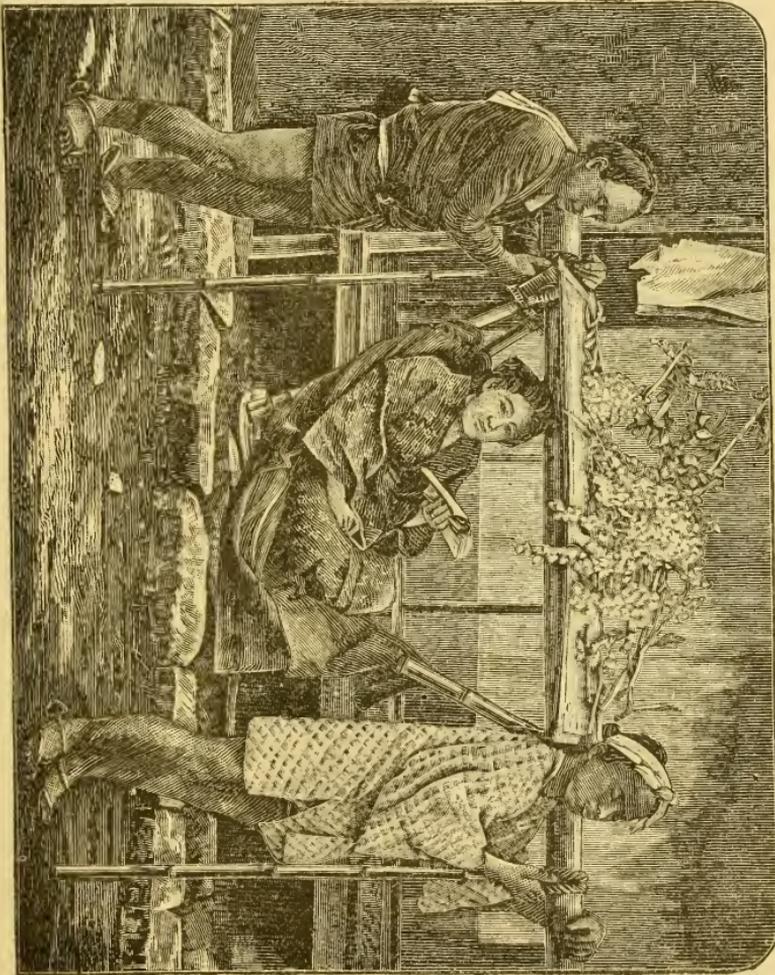

LETTER FROM JAPAN.

BY A LITTLE GIRL ONLY ELEVEN YEARS OLD.

DEAR MR. ROOT:—You have so kindly sent us GLEANINGS for such a long time, that I thought I would write to thank you. Though we do not keep bees, we enjoy reading your journal very much. Papa had a hive of bees when we were in America, but it is such a long time since we left our home there, that I have forgotten nearly all

not use tables to sit around at meal-time, as we do, but each individual has a small stand about the size of an ottoman, with a rim around about an inch high. The ladies sit on their legs as if kneeling, but the men cross them in Turkish style. Their rooms are small; some so small they will not admit a bedstead. The Japanese think that bedsteads are very funny, and that beds are very soft and springy. One of my acquaintances said she would be afraid of falling off, if she slept on one, and at first she was quite

THE WAY LADIES TRAVEL IN JAPAN: THE PALANQUIN.

about them. Papa often thought of writing to thank you for sending GLEANINGS, but always had so much to do with his mission work that he had no time to do so. But my dear papa died five months ago. He took sick from a poor woman he was attending.

The Japanese do not use honey for food; however, they have a "bee syrup" which they use as medicine. They consider it poisonous to eat with food.

The Japanese eat rice and fish a great deal. They use the bulbs of the lily and lotus flower. They do

not use tables to sit around at meal-time, as we do, but each individual has a small stand about the size of an ottoman, with a rim around about an inch high. The ladies sit on their legs as if kneeling, but the men cross them in Turkish style. Their rooms are small; some so small they will not admit a bedstead. The Japanese think that bedsteads are very funny, and that beds are very soft and springy. One of my acquaintances said she would be afraid of falling off, if she slept on one, and at first she was quite

stove-pipe hat, is ludicrous. They have taken a great fancy to canes, and also to Turkish towels, which they use as scarfs and small shawls, and nearly every one has a shirt, to which they add one or more of the following things: Hat, shoes, stockings, gloves, and necktie. The women dress in the native way except for umbrellas; however, some have adopted foreign dress, and wear high-heeled shoes, small parasols, cloaks and dresses; and though some of them look awkward with their hair done up in foreign style, and with dresses, gloves, and shoes on, still there are some that are quite at ease.

I will send a photograph of a kago, or Japanese palanquin, to the little girls you speak of in the JUVENILE. I have traveled in one; and though they are uncomfortably small for an adult, I was quite comfortable, for I am only eleven. Please give my love to the little girls. ADA M. KRECKER.

Tokio, Japan, Oct. 4, 1883.

Here is something further from our young friend Ada:

New Year's day is a great holiday in Japan. On the 1st every house has a small pine-tree before the door. Every person is out with his best, and mostly new clothing. Every family tries to have a breakfast of pounded rice cakes that have mashed beans in the center. On the 16th the Japanese think the door of heaven is opened, and all those in hell are having a holiday, so any wrong action is not reproved. Just now is the great kite-flying season in Japan. The Japanese kites are of a very different shape from the American kites. They are square, and have sometimes singers attached to them. Girls are playing battle-door and shuttle-cock.

Tokio, Japan, Jan. 9, 1884. ADA M. KRECKER.

I am sure, friend Ada, we all feel very much obliged for what you tell us about our Japanese brothers and sisters. I do not know but boys and girls might sit down cross-legged, or on their feet, as you say the women do; but for people no older than I am even, it seems to me it would be very fatiguing. Why, when I sit down to play with Huber after dinner, that way, it makes me feel so stiff that I can not walk straight for quite a little time afterward. But then, I suppose it is all in habit, although I think it would be very hard for old people, say those who can not sit easily without their easy-chairs. It seems to me that palanquin would be a very nice thing to ride in, if it were not for the feeling that somebody had to be lugging you around. However, if people wanted work badly, and were stout and able, perhaps they would enjoy the privilege of lugging you around, provided the pay were satisfactory. I am sorry our engraver didn't succeed in having the lady with a book a little more life-like. In your photograph she was quite a beauty. One would imagine you must have warm weather there, or that good-looking young fellow would feel a trifle chilly going around bare-legged. It seems to me their ideas of decorum in the presence of ladies is a trifle different from ours. And about those Japanese kites, it is just wonderful to think of their all getting a mania for kite-flying. I know schoolboys sometimes all go on one thing for awhile, and then something else. What is it about the "singers"? That is something I never heard of. Is it something that the wind makes sing? I may explain to our readers, that we credited our friend

Ada \$1.00 for her letter and photograph. And what do you suppose she picked out of our list for the dollar? Why, it was the life of our President Garfield; and I don't know that she could have found any thing better to be sent clear to Japan.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Silver Oil, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chief's amang we, takin' notes;
An' faith, he'll prent it."

THE BABY OF THE HOUSEHOLD.

WELL, little friends, Huber has been sick. Is it not sad to see a baby sick? For a few days he tried to play, but he couldn't; and finally he just lay in his crib all day feverish, moaning plaintively. How anxiously we watched for his little smiles, and tried to make him notice us! In the evening I held him a little, while his mother fixed the crib for him, and all at once he turned over and made a grab at something. It was some letters he saw sticking in my pocket. I tried to have him take something else, but he whopped over and grabbed the letters in both of his hands, and then began to crumple them to hear them rattle, and finally pushed them into his little mouth, and tried to sing as he does about his play. We all rejoiced, because we thought he seemed better; and pretty soon he was really better, and would laugh and coo and sing in his way. Didn't you ever hear a baby eight months of age sing? Well, he does not sing any tune, but he just made a noise like an old biddy in a spring morning, when she feels happy. He always sings when he eats his breakfast. Well, when he got so he could laugh right out loud with a real boyish laugh, then we knew he was a great deal better.

My little friends, did you ever hear an eight-months-old baby laugh out loud? How it seems to bubble forth in that delicious, childlike strain! His sister Blue Eyes had fixed a shawl over her head in a sort of comical way, and then she would run toward him, and he would make his hands fly, and feet too, and then just "ha ha" right out. The whole family gathered

around him, and then we had to laugh right out too. Now, if your baby was never sick, you do not know how happy and thankful we felt to have him well again, and able to laugh and crow and play. Poor little dears! what do they know about sickness and sorrow and pain? But they are God's children, you know, as well as ours, and he has said,—

Behold the fowls of the air: for they sow not, neither do they reap, nor gather into barns; yet your heavenly Father feedeth them. Are ye not much better than they?—MATT. 6:26.

My pa has 33 stands of bees. I have brown eyes. I have a little sister. She has blue eyes. She is three years old. I go to school. I read in the first reader. Steelville, Ill. CORA SUESBERRY, age 6.

My pa's bees keep him. I like bees first rate, but I like honey better. The bees bite with their tails, but the honey doesn't. My pa has 13 stands, and they are wintering well. Bees get honey from Indiana tobacco here. EDWARD E. VICARY. Morrison, Col., Jan. 13, 1884.

THE PALED BEE-YARD.

This summer we gathered more honey from our hives than any of our neighbors. We have our beeyard paled in now, and the bees fly over and through the cracks. I love to look at them. The worms killed one colony this fall, and it was the best one too; we got a great deal of honey from it.

JOHNNIE W. CALDWELL, age 12.

White Sulphur Springs, Ga.

MANDA'S LETTER.

My schoolmate said that you would send every little girl a book that would send you a letter, and she said that you were a great bee-man. We have some bees, but they are dying off for want of honey. We did have about 21 hives full. My papa does not take the JUVENILE, but I am going to coax him to take it. MANDA PRUSER, age 11. Defiance, Ohio.

HONEY FROM SUMAC.

Pa had 12 hives last spring, and now he has 31. Last winter the moths killed one stand. Pa took a good deal of honey, but he did not weigh it. The bees gather honey of the sumac and other flowers. This summer has not been a very good honey year.

CHARLES A. KYLE, age 13.

Houston, Mo., Oct. 30, 1883.

FROM 14 TO 28, AND 600 LBS. OF HONEY.

I am a little boy, and my pa has 23 hives of bees. He had only 14 in the spring. He got more than 600 lbs. of honey, and has got all his bees in the cellar, except 2. He has a board fence along the north side of where his bees are in the summer, to keep the cold wind off them. He has a fence along the north side of his grapevines. HARRY HARTMAN. Clarksburg, Grey Co., Ont., Jan. 3, 1884.

CLOTHES-PINS VS. NAPKIN-RINGS.

My brother has two swarms of bees, and they are living over winter so far. I will tell you a cheap plan for a napkin-holder. Take a nice white clothes-pin and put a pretty picture on it near the top, and tie a bright ribbon in a bow just above the split, and place the napkin in the pin. If you think this is worth a book, please send me Silver Keys.

CLARA BEECHER.

Hanna City, Peoria Co., Ills., Jan. 16, 1884.

Well done, Clara. Your fact is a novel one, certainly, and I confess I can not see

why a clothes-pin is not just as good as a napkin-ring. It certainly will answer the purpose, if anybody likes them.

ABBIE'S MOTHER, AND HER BEES.

We have 39 stands of bees. I have one stand of my own. We have a little house to put them in, in winter. We have hay under them, and hay between, and pa's haystack almost over them. Mamma said she will sell out, if she can. She said it is too hard work for her. ABBIE SEARS, age 9.

Ashland, Neb., Jan. 3, 1884.

Now, Abbie, we have had quite a discussion as to whether bee-keeping is too heavy work for women. If I understand it, your mamma would rather take side with the affirmative, would she?

THE MOTHERLESS CHILDREN.

Well, Uncle Amos, it has been a good while since I wrote to you. Since then, my ma has died and left me and my sister to keep house. She died very suddenly on the night of May 11. I am 14 years old, and my sister is 11. I have two little brothers and two little sisters, the oldest 7 years, the youngest 3 years. I also have one large brother, 17 years old. Pa had the misfortune to lose almost all his bees last winter, on account of not getting them packed away in time. He was summoned on a jury just about the time he should have packed them, and was away for five weeks. He has been thinking of having his name placed in Blasted Hopes. Coal oil is good to take wax off your hands. I was at Sunday-school once this summer. There is no Sunday-school nearer than Milo—that is about six miles from our house. I don't suppose I shall go to school this winter, for I must keep house for pa, and help take care of the little ones. LOU F. HALL.

Indianola, Warren Co., Iowa, Nov. 27, 1883.

May God bless and help you, my little friend.

Our bees, three colonies, are all we are going to try to winter this year. They are in good shape for winter, if plenty of natural stores is of any account. Each hive has eight Langstroth frames filled completely with honey and brood. We are trying a new way to protect them from the weather (or, at least, it is new to us) this winter. We leave the upper stories on empty, and lay a device (I do not know whose to call it) on top of the frames to raise the cushion, or make a passage for the bees, and fill the rest of the upper story with short cut straw, just thrown in loose, and the cover put on, and then the whole hive enveloped in corn-fodder.

I will tell you the way we put the fodder on. Just take two little poles that will bend easily; stick one end in the ground, and bend over and stick in the ground, and another pole the reverse, so that the bows cross right over the hive. Then commence and set fodder the same as it is shocked in the field, and tie with straw at the top, and you have a nice little house that will keep out wind and rain; and if the bees do die, the fodder will not spoil.

Our Sabbath-school is still in progress, and papa says they will try to keep it up all winter—something that has never been accomplished in this neighborhood yet. The weather is very rough and cold now here. It makes a person shrug up his shoulders to hear the wind whistle around the house.

VICTORIA J. FIELDS.

Valley Point, Pa., Nov. 28, 1883.

A SHORT LETTER FROM A LITTLE GIRL.

Pa has six colonies of bees. They are packed in chaff. I like honey, but I do not like stings.

Newburg, O., Jan., 1884. LOTTIE KELLY, age 5.

I helped my Uncle George take care of his bees last summer, and we had lots of honey. My pa is a mason, and I carry brick for him when there is no school.

Geo. D. HILTON, age 7.

Fremont, Mich., Dec. 26, 1883.

FROM 13 TO 29, AND 400 LBS. OF HONEY.

My brother keeps bees. He started in the spring with 13 colonies; increased by natural swarming to 29, and got 400 lbs. of honey. His bees are blacks, but he intends to get Italians next spring.

Lieury, Ont., Dec., 1883. GEORGE DURR, age 10.

FLORA'S LITTLE LETTER.

My pa keeps bees, and I like them and honey too. I have got a little brother, 8 months old; he has blue eyes. He is a cunning little fellow. I have been only 27 days to school.

FLORA J. RYMPH, age 9.

Port Erven, N. Y.

LITTLE CHICKENS ON CHRISTMAS DAY.

My brother has 10 stands of bees; he had 11, but some one broke one all to pieces to get the honey. We have 6 little chickens. We found them under the barn Christmas day, and we have got them all yet.

LIZZIE MARGRAVE.

Nohart, Nebraska.

CUTTING A BEE-TREE, AND WHAT THEY FOUND IN IT.

Last summer pa found two bee-trees. This fall he cut one of them, and got only a few empty combs. He sold eight swarms this fall. We got about 400 lbs. of honey this year.

FREDDIE A. PEASE, age 10.

Kingsville, Ohio, Dec., 1883.

ELMER'S REPORT.

I thought I would tell you how papa is getting along with his bees. We have 40 colonies, mostly in our chaff hives, and the rest packed in chaff on summer stands. He has sold 15 colonies, to go off next spring. I have two little brothers, 2 and 4 years old.

ELMER S. DIEFFENBACH, age 9.

Crosskill Mills, Berks Co., Pa., Jan. 1, 1884.

A RAT IN A BEE-HIVE.

My brothers keep bees. Winter before last they bought 3 swarms; this summer they had 23, but 3 of them died. The other day a rat got into one of the hives, and stirred the bees up so that some of them came in the house and flew around my mother's head.

L. E. KINCAID.

Pleasant Ridge, N. C., Jan. 12, 1884.

FRANK AND HIS WHITE LEGHORNS.

My pa has 50 stands of Italian bees, and took out 3000 lbs. of honey. He gave me one hive of Italians. I took out 80 lbs. of honey. I have a team and harness and buggy. I have worked in the field since I was 8 years old. I have a fine yard of white leg-horns, and I sell eggs, \$2.00 for 13.

Ogden, Ia., Jan. 13. FRANK CONNELLY, age 14.

HATTIE THE BEE-GIRL.

I have very good luck with my bees; all are in good order. I keep them on their summer stands all winter. It is warm to-day. They are flying in summer. I call my department the "Yellow Band." I have three hives; father has 20; I have a good time in summer.

HATTIE the Bee-Girl.

State Line, Miss., Dec. 26, 1883.

FROM 3 TO 5, AND 100 LBS. OF HONEY.

This is my first letter. I thought all summer I would write, but I went to school, and I have a good deal of work to do at home. My pa bought 3 stands of bees last fall; they swarmed 5 times last summer. We took 100 lbs. of honey out of one hive; there is one hive we have not got any honey from.

Afton, Ia., Dec., 1883.

IDA C. URAY, age 11.

HOW SADIE GOT STUNG IN THE NIGHT.

My pa keeps bees. He had 14 stands, but he sold one. Sometimes I help pa tend them. I have been stung twice—once when we were hunting for the queen, and the other time was in the night when I was in bed. It had got in the house somehow, and got on my ear.

SADIE BOGGS, age 11.

Endicott, Neb., Jan. 24, 1884.

A LETTER FROM A 7-YEAR-OLD BOY.

I live at my grandpa's. My uncle Robert keeps bees. He has 18 stocks. Sometimes I put on my gloves and veil, and help him. I have two bantam chickens, a kitten, and we have two Jersey calves and two canary birds. We have a horse we call Dolly. I went to school until the snow got too deep for me.

J. CLINTON DENHAM, age 7.

St. Clairsville, O., Jan., 1884.

HOW OUR BEES ARE GETTING ON.

Our bees are in the cellar. There are 26 stands, and one of them is mine. I got them a little way from our house, on a maple-tree. We found two in the woods near our house, but we have not got them yet. We did not get much honey this year, but we will try it another year. Pa is going to make an observatory-hive this winter.

WM. TYRRELL.

LaPorte, Ind., Dec. 12, 1883.

LYDIA AND HER THREE WHITE DUCKS.

Pa has 8 colonies of bees. Last summer 3 of them swarmed. We got a good bit of honey from our bees. In the summer, when they swarm, I go out and see pa hive them. I like to see the little busy bees gather honey at the flowers, for I like honey very well. I have 3 white ducks; they come every evening for some corn.

LYDIA MARTIN, age 11.

Goodville, Lancaster Co., Pa., Jan. 25, 1884.

EVA'S REPORT OF HER PA'S BEE-CAVE.

Pa has fed out 400 lbs. of honey to the bees. Our bee-cave is 28 ft. long, 7 feet wide, and 7 ft. deep, and covered with 2 ft. of earth, and a roof over that. There is a ventilator in one end, 1 foot square, and a door in the other end. They winter perfect every time, without any dwindling. Next time I write I will tell you about pa's bee-feeder.

EVA L. FARRINGTON.

Strawberry Point, Ia., Nov. 6, 1883.

LETTER FROM A 4-YEAR-OLD BEE-GIRL.

I am a little bee-girl. Don't you like me? Won't you send me a book? You sent Minerva one.

DAISY BELL DUNCAN, age 4.

Black Lick, Indiana Co., Pa., Dec., 1883.

Why, Daisy, it would be funny if I did not like little girls four years old, who can write letters, and a bee-girl besides. Why, it makes me real happy to think I have got such little friends. We send you a book, with great pleasure. Your letter was very nicely written, even if you did not put in any periods and other marks; but I guess we have got it all right, haven't we?

ANNIE'S FIRST LETTER.

My brother has 29 colonies in the cellar, and one outside. I help him to put frames and section boxes together.

ANNIE S. GRINSELL, age 9.

Baden, St. Louis Co., Mo., Jan. 16, 1884.

FANNIE, AND THE QUEEN SHE FOUND "TWO TIMES."

Pa has 9 swarms of bees. He found one swarm in the woods. They were Italians. We had 3 swarms to commence with last spring. I helped look for the queen, and I found her 2 times. I like to look for queens. I put on a veil, and go out. One skip made 30 lbs. of comb honey.

FANNIE B. MATHEWS.

Katonah, N. Y.

LIZZIE'S REPORT.

Papa has 5 swarms of bees. He had 7, but 2 went away this summer. He has them in Simplicity hives, surrounded with rough boxes packed with leaves; he has been taking GLEANINGS for two or three years; he says if he don't get more honey next year than this you must give him a corner in Blast-ed Hopes.

LIZZIE BATTLES.

Blairsville, Indiana Co., Pa., Dec., 1883.

5000 LBS. OF COMB HONEY.

My father has about 100 hives of bees at our place, and about 30 at a place five miles from here, that a man works for extracted honey. Father works for comb honey; he got 5000 lbs. last year. He built a new shop last fall. He has a horse-power for his shop. He is making a sawing-machine now.

JEWELL TAYLOR, age 10.

Forestville, Minn., Jan. 10, 1884.

I am the little girl to whom you sent the nice book called the Roby Family. It was a good book. We all read it, and send many thanks to you. I can not tell you about bees, as you wish little boys and girls to, but pa says he will get some next summer. Perhaps I can say some thing about the busy little bees, but I do want another one of your books. Will you send me Rescued from Egypt?

AMY C. MCKESSON, age 13.

Brecksville, O., Jan. 21, 1884.

SUB-EARTH VENTILATION; BY ONE OF THE JUVENILES.

My pa keeps about 60 swarms of bees. I am almost a bee-keeper myself. I manage the honey-gate when pa is weighing honey. He has made a ventilator for getting fresh air. The air comes through the ventilator 4 feet below the top of the ground, and the air from the ventilator is not much warmer or colder than the air in the cellar.

BRUCE COLTON, age 9.

Waverly, Iowa, Dec. 30, 1883.

THE BEES THAT ABSCONDED, AND THE OTHERS THAT DIED.

We have 13 swarms of black bees. Last summer the first swarm we had was a big one, and it came out about ten o'clock, and it commenced to make comb; in the afternoon it came out and went off. We have not had much surplus honey this year, for it was a bad year. Last spring four of our skeps died. Will you tell me what made them die?

WALTER L. MORRIS, age 13.

Youngstown, N. Y., Dec. 29, 1883.

Why, Walter, it would be a pretty hard matter to tell why your bees died, without more facts in the case, unless I should say it was for want of breath. Was it not for lack of food, Walter?

MOLASSES FOR WINTER FOOD.

I received Silver Keys in safety, but have not got it read through, as I go to school and do not have much time to read. My brother has got his bees packed in chaff hives for winter, and he feeds them molasses every day.

KATIE M. BRIGGS.

Deposit, N. Y., Nov. 27, 1883.

Friend Katie, unless your brother has better molasses than I have ever found under that name, I am afraid he will have trouble in wintering. I wish you would let us know in spring whether they come through all right or not.

3000 LBS. OF HONEY; THE BLACK PONY, AND THE WHITE-CRESTED BLACK POLANDS.

My father keeps 50 stands of bees, and took out 3000 lbs. of honey. I have one stand. My father packed them late in the season, and I did not get any honey. My bees are Italians. I found one great big swarm of bees in the grove. I have a little black pony, and I rode at our fair, and got first premium when I was 9 years old. I have a yard of white-crested black Polish chickens, and sell eggs at \$2.00 per 13.

SARAH CONNELLY, age 12.

Ogden, Iowa, Jan. 13, 1884.

BEES THAT WERE PUT UP STAIRS, AND HOW THEY TURNED OUT.

My papa caught a swarm of bees in the corn-field; and when cold weather came he put them in the cellar, and up stairs, and in the house. They would come out, and papa would have to catch them and put them back; and when spring came he had no bees at all. Now, my papa bought a stand of Italians last spring; he swarmed them twice last summer; thinks he will have better success this summer. He sent for 500 of your pound sashes.

WILLIAM HASENYAGER.

Tecumseh, Johnson Co., Neb., Jan. 18, 1884.

I presume, William, your pa did not put the bees up stairs after that. Unless you have a good dry dark frost-proof cellar I think they had better be outdoors, packed in chaff. I have never heard of very good success with bees up stairs. Light gets in during warm days; and when the winter is very cold, it is apt to freeze.

I thought I would tell you how pa is getting along with his bees. We started in to winter 9 colonies last winter; doubled to 7 in the spring, and had 21 this fall; doubled to 18. We got about 400 lbs. this fall. Pa hasn't any extractor yet, but thinks he will have to have one. I will tell you how pa winters his bees. He leaves them on their summer stand, and cuts coarse slough grass, ties it in small bunches, sets it up nicely around the hives, like shocks of rye or wheat, and ties a cord around near the bottom, and around the top. He has very good luck getting through the winter. This was a very poor season for honey, as it was so wet and cold and windy. Pa has bought 50 new Simplicity hives. He has not got frames enough for them. He thinks he will have to order some for them from you. Pa is well pleased with the A B C book and the smoker you sent him. We are going to school this winter, and we like our teacher very much. I say *we*; I mean myself and my twin sister Louisiana. I have a little sister 8 years old. She says it seems we get so many books from you we ought to know you.

ALABAMA ALLISON, age 14.

Beaver Crossing, Seward Co., Neb., Dec. 31, 1883.

My father has no bees. We had some, but when winter came they died, and we never had any since. I have seven sisters and one brother. I should like to come and see your little boy Huber.

SOPHIA HASELBARTH, age 12.

Defiance, Ohio, Nov. 28, 1883.

My pa has 50 stands of bees. He is going to pack them soon for winter. We pack our bees in the cellar. We did not have much honey this year. I am not going to school this week. I have got a little baby brother. His name is Fred. I think Fred is a prettier name than Peter.

LINA LANGTON.

Windham, O., Oct. 29, 1883.

JOHNNY AND HIS BROTHER; THE BEES, AND THE CALF.

My brother and I have three hives of bees. My grandpa was moving bees Saturday. We have seven head of cattle. I have one calf, and I call her Rose. This summer a swarm of bees went over our house.

Montrose, Lee Co., Iowa. JOHN E. ALVIS.

ARTHUR AND HIS PETS.

As my sister wrote you a letter, I thought I would write too. Pa has got one stand of bees I call mine. He said it was the biggest stand of bees he had. As the other boys are telling what their pets are, I will tell you what mine are. I have a pet cat, and a pet lamb. My lamb got its leg broken last summer. The Sunday-school had a Christmas-tree here. I got a box of water-colors. I love to paint with them. This is my first letter.

ARTHUR W. COOMBS.

Memphis, Ind.

My pa bought a swarm of hybrids last spring. They increased to four. The two last ones were small, so he fed them sugar so they would have plenty of honey to winter on. This fall he bought six more, so now he has 10 fine Italians and one Syrian. The mother of one Italian swarm is an imported queen that came from your place. I like honey, and like to see the bees work; they sting me sometimes. Pa is going to send for the A B C and GLEANINGS this week, and a smoker.

Bettsville, O. JOHN H. WHITNEY, age 11.

HOW MAMMA GOT THREE SWARMS OF BEES.

My father has 17 swarms of bees, and they all started from a third swarm. They are all but one swarm buried in the garden, and the other is in the cellar. They are all in old-fashioned hives. Papa is going to get some new hives. What kind do you think would be best? Last summer papa went fishing, and told mamma that she could have all the bees that came out, and there were three swarms when papa came home. He thought mamma had a pretty good day's work. We live on a big farm.

DeRuyter, N. Y. ANNA LEWIS, age 12.

A CAUTION ABOUT USING SMOKERS.

Pa commenced last spring to take care of bees; he bought 12 swarms; they swarmed nearly all of the time; he has 28 swarms. He had bees in 31 hives, but other bees robbed 2, and he got fire into one with his smoker while taking off honey which scorched the bees, and melted the honey before he discovered it. He has about 600 lbs. of white comb honey, and about 40 lbs. of buckwheat comb honey, besides some extracted.

Moravia, N. Y. MINNIE M. WHITNEY, age 13.

Minnie, tell your pa to be careful to give the smoker a puff just before he blows the smoke on the bees, and then he won't get any sparks in the hives.

A NICELY ARRANGED APIARY OF 115 HIVES.

Pa has 115 colonies of bees, and I help him in the apiary, and go to school whenever there is one in the district. Pa has a Barnes foot-power saw, and enough material cut in shape for 75 two-story Langstroth hives, and a honey-extractor, uncapping-can, lamp nursery, and lots of other things. He has his bees in the orchard, and winters on the summer stands, packed with straw and leaves, and he has a screen of evergreens about 12 or 15 feet high, on the west side of the orchard.

OLIVER R. MOSS, age 12.

Colchester, Ill., Jan. 21, 1884.

THE NEW HOUSE, ETC.

As my sister Maud wrote to you, I thought I would write too, as I was 10 years old last December. We are living in our new house, and we find it very comfortable, through this cold weather. This is the first letter I have written; I go to Sabbath-school, but I have not been since we burned out, for I have not had any thing to wear. Pa has got some of his bees down cellar, and some outdoors, packed away for winter. Those that are down cellar are happy. Does the new railroad come near you? If it does, I am coming out there to see your little Huber that I have read so much about.

NELLIE MAY LATHROP.

Marshall, Mich., Jan. 7, 1884.

HENRY'S OPINION OF THE SIMPLICITY HIVE.

Father has 8 swarms of bees. We have the Simplicity hives; this winter we made eight boxes. I have a swarm too. The Simplicity hive is a very handy box for bees, but some people say they don't like the Simplicity hive. They say that you can't see if they have honey or not; but we like them, as they are so handy to look at, if they have the sections full. I like to be about the bees when they swarm. I like to help to live them. Jonathan Horst has 17 swarms, and he made boxes in our shop. We have a circular saw, and a little horse-power to run it, and he made 12 boxes.

HENRY W. MARTIN, age 13.

Goodville, Pa., Jan. 23, 1884.

CLARA'S ACCOUNT OF CUTTING A BEE-TREE.

Papa has 6 stands of bees, all packed over head and ears in chaff. They are all hybrids but one Italian. They made what I call lots of honey. One young swarm made 60 lbs. of comb honey in pound sections. As we have no basswood here, don't you think that was well done? Papa got a queen from Mr. Doolittle, but she was a hybrid; then when they swarmed they went to the woods. Papa and Uncle John found one in a tree. The man who owned the tree did not want it cut, so they climbed up. Papa said it was a large pine-tree. It was 70 feet up to where the bees were, and they cut a hole and took the honey out. They got 6 big buckets full of comb honey. They let it down with a long rope.

CLARA HUSTON, age 10.

Somerset, Somerset Co., Pa.

CHARLEY'S FIRST LETTER.

Ma has 18 colonies of bees. She commenced two years ago with three hives. Her bees didn't do very well last summer. Ma keeps geese, ducks, turkeys, and hens. I have two sisters and two brothers. My pa is a farmer. He has 5 "eighties," all improved but 40 acres. We have three span of horses, pigs and cattle, four cats, one dog, and lots of doves. I

took my music lesson a week ago. I love music. I go to school. I haven't missed one day, nor been tardy. I like my teacher. I do lots of chores. This is my first letter. If you can read this, please send me Ten Nights in a Bar-Room.

CHARLES ARTIS, age 10.

Augusta, Eau Claire Co., Wis., Jan. 21, 1884.

A PAPA WHO DOESN'T DRINK NOR SMOKE NOR PLAY CARDS.

Papa has two bee-yards — one here and one in Olmstead. He has but two hives here. He says they did not freeze up this time, in spite of being the coldest weather we ever had. Papa makes all his hives himself, and sells a good many besides. He doesn't drink nor smoke nor play cards. He is the best papa in this wide world. I shall keep bees, too, this coming summer, and so will my little brother Johnny.

BERTHA KUEHNE.

Cairo, Ill., Jan. 25, 1884.

HARRY'S PROBLEM.

My pa has 19 swarms of bees, mostly in chaff hives. One swarm went away last summer, but pa followed them to a tree. Last fall he cut the tree and got 30 lbs. of honey. Pa said he would give me a swarm of bees if I would make a Simplicity hive. I have a problem for you. A man had an 8-gallon jar full of oil; also a 5 and a 3 gallon jar, and wanted to divide the oil equally between the 5 and the 8 gallon jars. How would he do it? Pa sent for the Story of the Bible, and I have it nearly read through. We all like it.

HARRY LABARGE.

Ada, Kent Co., Mich., Jan. 25, 1884.

Harry, why wouldn't it do to call it honey, instead of oil, and then you know it would be just right for a bee-paper? By the way we have to change honey around here, we might have to do that very thing. Who will tell Harry how we shall have to manage it?

FROM 8 TO 25, AND 300 LBS. OF COMB HONEY.

EDITOR GLEANINGS:—My brother and I keep bees. Winter before last we bought three hives, and they increased by natural swarming to eight the first year; all came through the winter strong. Last spring we had a lively time of it during swarming season. They increased to 25 large swarms. We took 300 lbs. of comb honey in the spring, from 8 hives. The summer was so dry that we did not get any honey this fall. The winter was so mild up to Christmas that the bees have been flying out of the hives. But it turned suddenly cold, and snowed, and left some of the little fellows sticking to the fence-rails. Being overcome by the cold, they could not get back to the hive. We also noticed one little fellow creeping on the snow, but he soon froze to death. We supposed it had been run out of the hive for some misbehavior.

W. T. KINCAID.

Gastonia, N. C., Jan. 14, 1884.

HONEY AND POLLEN IN JANUARY.

I had 10 stands of bees in Simplicity hives. One of them died; five are Italians, and the rest are black. We had lots of pollen on the 15th of this month. Four and five bees came at a time. This day, the 18th of January, lots of pollen. The bees are falling down in the sand because of pollen. There have been lots of little blue flowers in bloom all winter. The bees get their pollen and honey from willow. The one that died was a nucius.

CHARLIE RUSK, age 16.

Milwaukee, Oregon, Jan. 18, 1884.

Thank you, Charlie. It is quite interesting to get the knowledge of the countries

that you juveniles give us. Now, I did not know before that Oregon is so much warmer than it is here. I had got a kind of idea it is cold, because it is away up north by Canada.

REPORT FROM A FOUNDATION MACHINE, BY ONE OF THE JUVENILES.

The machine that you sent pa works nicely. We have made 31 lbs. on it. We have 51 swarms of bees. They are all alive yet, nearly all in chaff hives. We have had some very cold weather, down to 22° below zero. Pa's bees made about 900 lbs. comb honey in 1-lb. sections. They would have made more, but we could not stop them from swarming. We hived 28, and put as many back, and one went to the woods. Pa never puts unsealed brood in new hives, and he never had more than two swarms go away, in seven years.

D. E. C. ROUTZON.

Findlay, Ohio, Jan. 7, 1884.

FROM 16 TO 40, AND 700 LBS. OF HONEY.

Pa had 17 stands of bees. He lost one in winter, and several were very weak. He has increased to 40, and taken 700 pounds of honey — 500 extracted, and the rest in one-pound sections; 33 are in your chaff hives, all painted white, with brown corners and top, each with its number in the center of the front, with the upper story filled with forest-leaves, the rest in the cellar. I have a little sister. She has blue eyes too. As all other little girls are telling what they can do to help their mammas, I will tell you what I can do. I wash dishes, sweep, and churn, and take care of the baby. I go to school. I am in the third grade. I feed the chickens, and hunt the eggs when I get home from school.

PEARL E. VINANT, age 8.

Sunman, Ripley Co., Ind., Dec., 1883.

HOW THOMAS HELPED HIVE A SWARM OF BEES BAREFOOTED.

My father has 41 stands of bees; he is wintering 11 in chaff hives, and 30 in the cellar. I hope any won't die, for I like to see them swarm. It is hard for my father to tend to them, as he has but one leg. The other was lost at Jackson, Miss., July 12, 1863. I help him as much as I can about them. When he takes off honey I carry it to the house. I have three brothers. The youngest one, the bees don't like nor does he like them. When they sting him it makes him sick. Last summer two stands swarmed at the same time, and alighted in the same tree, in a cluster. I had to be careful where I stepped, for I was barefooted. I climbed the tree and shook them off in the swarming-box. I held till my father got through the fence. They were not light. We put them in the same hive in the afternoon. We took half the frames that were in that hive, and put into another.

THOMAS STOCK, age 13.

Nashua, Iowa, Jan. 16, 1884.

FLORENCE'S FATHER AT THE FAIR.

Pa started with 15 colonies of bees, and increased to 30 colonies. He took the first premium at the county fair at Charleston, Ind., on comb and extracted honey, bees, extractor, honey-knife, and bee-hive. He made an observatory-hive, so they could see the bees. There was a crowd around him all the time, to see and ask about the bees. Pa has got one colony of hybrids which made him 266 lbs. of extracted honey. He could have taken 50 more lbs., but he wanted to feed it to the other bees. He did not have any trouble in selling his honey. He could have sold more than he did, if he had had it to sell.

Every time our neighbors had a swarm come out, they would come to pa to have him hive them, and get a hive of him to put them in. I visited the Louisville exposition last fall. I saw the "baby engine," and saw them weaving gingham. My uncle, James M. Gray, had a hominy-mill there. Uncle James has got bees, but he is afraid of them.

FLORENCE E. COOMBS.

Memphis, Ind., Jan. 13, 1884.

FROM 9 TO 20, AND \$68.00 IN MONEY.

Pa has 20 colonies. He reads bee journals and books all the time. He had 9 colonies last spring, and he sold bees and honey to the amount of \$68.00, and increased to 19 by swarming. He gets 16 $\frac{1}{2}$ cts. for extracted, 25 cts. for comb honey. We keep plenty for our own table, and ma puts it on the table every meal—bread and butter and milk. I am afraid of bees, but I can tell when they are robbing and swarming. I know the queen, and can tell drones and workers. Our honey candies in cold weather now; but before we moved across the street, our honey never candied. Pa is a carpenter, and makes all hives. He wanted me to study the bee-books, and read the journals, and be a bee-keeper. I am almost nine years old. I should like the Giant Killer. The clerk who opens the mail will please put this at once in the purple basket.

JOHNNY LAWRENCE.

Linnville, Ohio, Jan. 28, 1884.

Well, I declare, Johnny, you deserve the Giant Killer, and I thank you, too, for the excellent report you have given us. But if all the juveniles demand that their letters be put into the purple basket, what will become of the other folks?

ANOTHER HIVE WITH OPEN CRACKS, AND SPLIT FROM TOP TO BOTTOM.

As I have been studying in the house a good deal lately, I have noticed the bees considerably. The old box hives that did not have caps on were wet inside, while those that had caps on were dry; so I got all the caps I could, and put them on. Pa has kept bees a good many years, and one winter the bees, all but one hive, winter-killed, and that one was an old box hive that was split clear up and down. We have that one yet, and I believe it is the strongest swarm we have, for it always sends out several strong swarms. There are cracks on both sides of it; one of them is nearly half an inch wide, so we give our bees plenty of air on top. There is one swarm in a Langstroth hive that I do not believe will live until spring, unless it is fed. Will you please tell what to feed them? I have been studying my A B C lately, and have got to "Hive-Making."

EDWIN J. STICKLE.

Macomb, Ill., Jan. 23, 1884.

We have pretty good proof, Edwin, that bees winter with ventilation such as you mention, when they would die without it; but I believe there is such a thing as giving too much ventilation; for instance: Yesterday was a warm day, and the bees were flying, and we examined some of the hives. Well, they were found to be all right, except one. This one was opened late in the fall, to get some bees to put in with some queens. Whoever opened it did not put back the chaff cushions properly, and an opening was left right up through to the cover. The bees were all dead, and a good many of them had crawled up through this opening. Feed your bees candy, as directed in your A B C.

THE OIL-WELL.

Papa has 11 hives of bees, and I have one. Six are in the cellar, and six outside. But this cold weather, from zero down to 25° below, we would rather have had all of them in. Papa has an oil-well and a feed-mill attached to the oil-well engine. He ground about 400 bushels of grain into feed the last year. The mill is an 18-inch vertical buhr stone. The oil we get, we use in the lamps just as it comes out of the well. It is good oil, and safer than some of the refined oil. It produces only three-fourths of a barrel per day; was drilled in 1877. This is my first letter. If you think it worth a book, please send Silver Keys.

MARY E. SOMERVILLE, age 8.

Brady's Bend, Pa., Jan. 20, 1884.

Well, now, Mary, that letter is a very interesting one—to me, anyhow. I once sunk a well for oil, but I did not get any. I should think that three-fourths of a barrel of oil a day, good enough to burn in lamps, just as it comes from the ground, would be quite a nice thing to have. Is it not wonderful to think of getting oil out of wells? I can remember when no one ever heard of such a thing; and what do you suppose they had to read by evenings? Why, just greasy tallow candles. I suppose some of you children nowadays would hardly know what a tallow candle is for. May God be praised for the oil, as well as for the honey and all other blessings.

A COUPLE OF PRINTED LETTERS FROM GEORGE AND JESSE.

MISTER ROOT, DEAR SIR:—I SEE SOME OF THE BOYS AND GIRLS ARE PRINTING TO YOU, SO I THOUGHT I WOULD PRINT YOU A LETTER, AS I CAN NOT WRITE. I HAVE TWO LITTLE BROTHERS AND ONE LITTLE SISTER. I AM THE OLDEST OF ALL. MY PA KEEPS BEES. HAS 75 SWARMS. ALL ITALIANS. MY LITTLE BROTHER ALMOST TWO YEARS OLD USED TO FOLLOW PAPA OUT WHEN HE WENT TO WORK WITH THE BEES. HE WOULD PUT HIS HANDS ON TOP OF A CHAFF HIVE, AND STAND ON HIS TIPTOES, AND THEN HE COULD JUST PEEK OVER INTO THE HIVE. PAPA SAYS I MAY SEND YOU A REPORT OF HIS BEES AND HONEY. HE COMMENCED IN THE FALL OF 1880 WITH TWO SWARMS, BOUGHT OF DAN WHITE; IN 1881, EXTRACTED 120 LBS. HONEY, AND INCREASED TO SIX; IN 1882, EXTRACTED 900 LBS. HONEY; INCREASED TO 16; 1883, EXTRACTED 840 LBS., AND INCREASED TO 35. HE MAKES ARTIFICIAL SWARMS, AND BREEDS ALL HIS QUEENS FROM AN IMPORTED QUEEN HE GOT FROM YOU. WE NEVER HAVE LOST A SWARM.

GEORGE KNAPP, AGE 7.

ROCHESTER DEPOT, O., JAN., 1884.

I WANT TO PRINT SOME TOO. WE ALL GO TO CHURCH AND SUNDAY-SCHOOL. MY PAPA'S NAME IS N. A. KNAPP. HE SAYS, ASK MR. ROOT IF HE EVER HAD A YOUNG QUEEN COMMENCE TO LAY AS LATE AS OCTOBER 25, AND DRONES FLYING NOV. 4. MAMMA GIVES US ALL THE HONEY WE WANT TO EAT.

JESSE KNAPP, AGE 5.

ROCHESTER DEPOT, O., JAN., 1884.

Yes, Jesse, I have had queens commence to lay as late as October, although I do not remember that I ever saw any drones fly in November.

Our Homes.

For what is a man profited, if he gain the whole world, and lose or forfeit his own self? — LUKE 9: 25, *New Version.*

OUR prayer-meeting had closed at half-past six on Sunday evening, and I was just about half a mile from home. The weather was very cold indeed; but as I have always been in the habit of boasting that I can always keep warm if you will let me go on foot, I did not anticipate any thing unpleasant. Before I got home, however, I began to fear my ears would freeze. I held my mittens over them, but this prevented my swinging my arms, and so I got quite chilly before I got into the house. Notwithstanding being cold and supperless, something seemed to be telling me that I ought to attend the meeting at the — church, where a number of our hands had been going, and some had risen for prayers. I told Mrs. R. I wanted some supper real quick, because I felt as though I ought to go to meeting.

"But you won't get your ears warm before meeting time, my husband, to say nothing of getting your supper." And so I began to think perhaps I wouldn't go. So much zeal such a cold night would look, at least to the friends at home, a little singular. Now, in my younger days I used to pride myself a little on being singular, and used to like to have folks make observations on my eccentricity. Of late years I have felt this to be wrong and wicked, and have studied to avoid singularity. Are there any of you, my friends, who have had that same kind of feeling, that you like to be thought odd and peculiar? Well, take my word for it, that it is a grievous sin. It is a sin against God and your fellow-men. It mars your value in society, and your ability to be of use to your fellow-men. If you are a Christian, you have no right to want to be thought funny, or different from other people. You can hardly do so and be truthful and honest; and your first duty toward your God and your fellow-men is to be frank, honest, and sincere. After I had finished my supper, and had got somewhat warmed, I still felt that I ought to go to that meeting; and even though it was late, I decided to go; and as soon as I had so decided, I felt a sort of peace that seemed to say I was doing right. I often have these impulses, as you know, friends, and I almost always get a blessing when I follow them. Please bear in mind, that I mean *right* impulses. We have impulses to evil, as well as to good, and it would be a very sad mistake indeed to confound the two in the least.

Preaching had commenced when I got in, and I did not catch the text; but the good pastor was telling a little story by way of illustration. The story, as near as I can remember, was something like this:

A man who had been greatly addicted to intemperance, and who had promised to break off so many times that his wife had almost lost hope, and it seemed as if it was a waste of words to make any more promises, or have any more talk about it, was in deep remorse and sorrow, after a terrible spree he

had just passed through. What should he do? He commenced in this way:

"My dear wife, I am going to stop drinking." These words fell on her ears without awakening any feelings of joy, for it was the old, old story. He resumed: "This time I will put it in writing." At this she brightened a little, but not much; for what good would writing do for a man who had no respect for his word? The next sentence almost gave her a ray of hope. Said he: "I will put it in writing, and will send for our family physician to sign it for me, and to help me. We will also get the pastor of our church to unite with me to witness my signature, and to help me to be a man." As she was a professing Christian, this gave her a great thrill of hope; for we all know that where a man goes to God, as did the prodigal son, with humility and sincerity, Satan's work is at an end. "More than this, my dear wife, the doctor and the minister and myself with you, if you will go, will visit all the saloons in our place, and everywhere that intoxicating drinks may be procured. We will show them the paper and the signatures; and if it be a possible thing to save me, it shall be done."

All that he directed was done, for the minister and doctor gladly consented to their part, (what minister and doctor would not?) and everybody rejoiced, for it seemed that our poor weak friend had made a sure thing of it this time. He had himself brought about prohibition. Do you want to know how it turned out, friends? He was a sober, steady, industrious man for just about eight months. At the end of that time his wife was notified that he was at a neighboring town some eight or ten miles distant, in a state of helpless intoxication, and that she had better come and get him home. Only God knows of the sorrow and grief that attend a poor wife who is called upon to pass through scenes like this. Had it not been for the knowledge that he possessed, that liquors could be obtained by going to a neighboring town, he might never have fallen. God grant that the time may come speedily when this work may be stopped. Now for the man of our illustration, or was he indeed a man? How much manhood is there about one who has broken his word and his promise so many times that no one wants to hear him promise any more? Does not the world say with almost one voice, that the *man* part is gone? The soul is gone; the God part that is in us all, if you choose, has been bartered away and sold, and Satan rules. Satan owns the man, soul and body. The common version of our text is, in fact, "What shall it profit a man, if he shall gain the whole world, and lose his own soul?" Our good pastor was trying to tell the people there assembled, that there is great danger of losing their souls right here in this world.

Within the past few months, my mind has been, as a matter of necessity, turned a great deal toward steam-boilers and steam heating. It has been an interesting study for me to follow the intricacies of the laws of heat and the laws of condensation; and in carrying steam over to our house, queer facts

have been brought to my notice. For instance, if we want a steam-boiler to do work, we must look out for the outlets. If steam is escaping at any point, even a mile away from the boiler, the engineer may pile in shavings and coal, and do his utmost, and yet not keep the steam up. When every thing is tight, the steam set free even under one little boiler may do a vast amount of work, and serve over a vast territory. It will warm up the house as if by magic, turn great wheels, melt wax and honey, cook food, and prove a wonderful help in many departments of life; and while it is kept within bounds, the engineer has not a very difficult task to keep every thing moving nicely. Let even a little leak show itself, however, and although the steam that first escapes is so insignificant as to make no perceptible difference, if allowed to go on unchecked, soon wears the orifice larger, and by and by it whistles through with a shrill scream, as it were. The pressure on the pipes of the whole institution diminishes, and seems to rush frantically, as it were, to the place of outlet. The machinery slacks, the great pipes cool off, and so long as this little opening, far away and out of sight, it may be, remains uncared for, the whole steam-boiler is for the time almost useless. How should the steam in the pipes, far away, know that there is a place of exit here? And why should the whole establishment suffer from just this one little flaw?

So it is with a human life. We learn from ancient history that Thebes had a hundred gates. I have sometimes thought that there are a hundred gates, or places of danger, to the human heart. While all of these are closed, or carefully guarded by the vigilant owner, he is a useful member of society; but let one in the hundred get open, or unguarded, and the soul of the man oozes out, little by little, and he is a lost soul. The man may be perfect in every respect, except that he has longings for strong drink that sometimes overpower him. If they have overpowered him once, they will be pretty sure to do so again, and each time he yields he is less of a man. If he has a violent temper that he sometimes gives way to, this is another opening through which maudood may go. If he is addicted to untruth, and has become hardened so that he does not scruple to falsify when he thinks he won't be found out, steam has commenced to escape; and if the break is not promptly closed, the man is soon useless. Did you ever know a person whom you had learned to put no dependence in? and have you noticed how quickly everybody found it out, even the children? And the poor fellow, unconscious of his fall, goes through the world passing falsehood for truth, and thinks nobody detects it.

Within a few days back, another opening has occurred to me where one's usefulness and value to society ooze out, and it is a sin of which most of us are more or less guilty. It is in falling into a habit of commencing a great many things which we never finish—of scattering our powers. A farmer chops a tree down, and then lets it lie and rot; a mechanic begins a machine or a vehicle, and consoles himself by thinking that some day

when he feels like it he will finish it up. Pretty soon the individual has a life full of half-finished projects. He gets behind hand and in debt, while if all the labor he had bestowed on this, that, and the other were utilized and turned into cash, he might be out of debt, and have a little surplus besides. Such habits are like escaping steam, that will ruin a man if he does not shake them off and free himself. Now, it is not only direct falsehoods, evil habits, and half-finished tasks and things of this sort, that cause a man to lose his soul in the sense in which I have put it, but there are things not at first as apparent as the positive sins, that may lead to the same result. When we laid the steam-pipes over to our house, I declared to the men who were doing it that the pipes must be absolutely dry, and therefore on my own responsibility, although they did not seem to think it really necessary, I had a tile under-drain laid in the ground under the box that held the pipes. During the flood of water we had a few days ago, while the ground and many outlets were held fast in frost, the water backed up in this drain, and covered the steam-pipes. I was watching for the effect. The engineer soon announced that he could not keep up steam possibly, although every outlet was absolutely tight. The trouble was, ice-cold water had backed up and covered the steam-pipes; and before steam could be made to pass through these pipes, this whole body of ice water, with the cold wet ground surrounding, must be raised to the boiling-point of water. The consequence was, that while there was no opening in the pipes, the ice water surrounding them condensed the steam as fast as the boiler could make it, and such an immense draft on the powers of the boiler and fuel was more than it could stand. When the steam was shut off from this line of pipes, all went well.

You see, friends, although there was no break or flaw in the pipe, the surrounding influences made almost as much difference as a break would. A young man with the best of parents, under the influences of friends, home, and Sunday-school, Christian people, and all else that can be brought to bear, is not safe against the corrupting influences of bad society and late hours. It would corrupt a saint to be compelled to be where he daily heard blasphemy, obscenity, irreverence toward God, and things of that kind. Nothing can be brought to bear on a young man to counteract constant evil associations and surroundings.

It is a Christian duty for every man to keep away from bad influences as far as he can, and neglect no necessary duty. A part of the Lord's prayer includes this thought—keep us from temptation. For a time, we may not see that contaminating influences are doing us harm; and we may think that our trust in God, and our hold on spiritual things, is such that nothing can shake it. But remember, that he that thinketh he standeth should take heed lest he fall. It is customary to cover steam-pipes with a sort of non-conducting material, to prevent condensation, and to retain the heat. And so should a Christian do. He should surround himself with good influences, with Christian

friends; and when it is necessary that he should go into the haunts of vice, and among the lost, he should go protected and fortified by prayer, and by God's word.

I want to speak of another way in which a man may lose himself, or lose his manhood. Getting into quarrels, or having difficulties with individuals, is like leaving the pipes unprotected, or letting the steam escape. Did you ever notice, dear friend, that when you once decide that it is your duty to stand out with somebody, how quickly another man seems to be in the same attitude, and you feel it a duty to stand out against him? In other words, if you quarrel with one man, the chances are very great that you will soon quarrel with another, and the third one comes quickly along, and so it goes. If you have a lawsuit on your hands, struggle against it as you may, you will be in great danger of having another lawsuit with somebody else in a little time, until eventually you have a lawsuit on your hands all the while, or three or four of them. When Satan once gets a finger hold, he makes diligent haste to follow up his advantage, and pretty soon the man has lost himself, and Satan has him in his power. It is on this account mostly that I am afraid to go to law. I am afraid of stepping over the bounds, and of going further than a Christian ought to go. So long as we are entirely out of the turmoil and strife of the world, and looking constantly to God for counsel and guidance, we are comparatively safe; but when it is necessary to step out and take up the defensive or offensive, as it may be, then must the Christian be careful. All the world is looking on, and everybody is saying, "Now we will see how the Christian does." And woe betide the man if he gets proud or naughty or stubborn, or forgets to seek daily in his closet, on bended knees, God's guidance and God's wisdom.

It may be right to stand out, it may be right to go to law, and it may be right to take a man and hold him up before the public, no matter what consequences ensue; but before we undertake things of this kind, my friends, we should be very careful. Ernest told me, a few days ago, that in one of the classes in college they were discussing whether it were *ever* right to deceive. The professor, an old gray-haired man, said to some of the boys who pressed the question hard, that perhaps it might be, under certain circumstances, right to use deception; but he told them, with a sly twinkle in his eye, that none but old men were ever privileged to do things of this kind. Now, it is so about standing out in a way that brings lengthy quarrels. Almost any thing should be sacrificed, rather than to get into a quarrel; and when it is necessary, one had better be pretty well along in years, that he may have wisdom and discretion to enable him to be careful and judicious.

A man's character, or soul, is largely made up by his truthfulness. If you decide that circumstances make it right to depart from the truth just a little, you have opened a passage-way for the steam to escape; and before you know it, your very self begins to ooze out. One can not stand still on this

ground, for Satan follows up his advantage; and worst of all, he persuades you that you are all right, till you have become so untruthful that your character is like the escaping steam that screams as it hisses from the broken orifice; and yet while this is apparent and disgusting to all the world, you yourself don't know it. If you would save the God part that makes you a man, be careful, I beseech you, my friend, how you accustom yourself to be loose about statements of fact. If you have ever had a weakness that way, make it your life work to fight it down and trample it under foot.

And the tongue is a fire, a world of iniquity; so is the tongue among our members, that it defileth the whole body, and setteth on fire the whole course of nature; and it is set on fire of hell.—JAMES 3:6.

Now, our good pastor, at the close of his sermon that I told you about in the fore part of this paper, spoke something as follows:

"My friends, I want to say one word more about that man who had lost his soul. Some time afterward, a colored woman came to the town where I was preaching (for I was the pastor who went with him to the saloons with his family physician), and this woman was enabled so to hold up the cross of Christ that he became converted, and was a new man. Eight years have passed since then, and yet he stands a steady, faithful, business man and Christian worker."

At this point I could hardly restrain myself from saying, "Praise God for this;" and, in fact, I concluded I wouldn't restrain my feelings, even though I *was* in another church than my own. Now, friends, while it is a sad, sad fact that a man may in this world lose or forfeit his soul or self, for the things of this world, it is a glorious thought held out to all lost humanity, that Christ Jesus died to save sinners.

The figure of one who is lost through sin is a sad sight indeed; and if nature gave no remedy and no help to those who had gone down to darkness and death by folly and sin, even though it were sin of their own choosing, the moral universe would be a sad, sad thing for contemplation. Blest be the words that a loving Savior speaks to a lost and ruined world. "I am the light of the world. He that followeth me shall not walk in darkness, but shall have the light of life." Therefore be not downcast and discouraged, my brother, even though you have promised and pledged yourself, and have fallen; and even though you have fallen again and again, remember that He who died for us yet lives, and that when all the world have gone and given us up, when every last friend has turned from us in discouragement and disgust, yet those bleeding hands are held out still; and remember, that even though you are a sinner, it was such that he came into the world to save.

For whosoever will save his life shall lose it; but whosoever will lose his life for my sake, the same shall save it.—LUKE 9:24.

For God so loved the world, that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life.—JOHN 3:16.

For the Son of man is come to save that which was lost.—MATT. 18:11.

Tobacco Column.

A STORE-KEEPER WHO WILL NOT SELL TOBACCO.

ALLOW me, as a brother in Christ, to express my pleasure in congratulating you on the healthful, moral, elevating influence of GLEANINGS in my family. I mean just what I say; I very much respect you and your assistants for the manly, Christian, outspoken, but kind tones of the GLEANINGS articles and comments, and prayerfully hope and trust you will go right on in the Master's service, doing all you can for him who has done so much for you and me. I hope some future day (if you think proper) to send you an article on the tobacco question, and give you my experience therein. Although a general store-keeper, I have fully decided to sell no more of that health-destroying, expensive, and filthy stuff. J. P. DONEY, SR.

May God bless you, friend D., for your kind words. For your encouragement I want to add, that in Medina there are almost a dozen groceries, and only one among the whole that will not sell tobacco. The young man who first took this stand in this matter is one of the bright new converts among our young Christians; and after he had carried on business for over a year without tobacco, he said he was willing to compare sales with any grocer in the town; so we have another verification of my old and well-tried text, "Seek ye first the kingdom of God and his righteousness, and all these things shall be added unto you."

I informed a friend of mine that you would give a smoker to any one who would stop using tobacco. He said if you would send him one he would stop; and if he ever used it again, he would pay you for the smoker. G. W. O'KELLEY, JR.
Harmony Grove, Jackson Co., Ga., Dec. 30, 1883.

Will you allow an outsider to drop a few lines in your valuable journal, which will come under the head of Tobacco Column? I shall be 21 years of age the 20th day of January, and have been chewing and smoking tobacco for 5 years, thinking all the while it looked eloquent and smart, and believing all the time it was injurious to my health, or, at least, elder ones told me it was, and so I have taken a pledge not to chew or smoke any more tobacco.

Miles, Ky., Jan. 9, 1884.

J. C. CLOYES.

AN UNEXPECTED TESTIMONY.

I was much surprised at receiving a Clark smoker through the mail, and later, a postal stating that you had sent it free, "no charge." I did not mean to even hint at such a thing in what I said in a former letter. Many thanks. But I can not imagine *why* you sent it. It made me think of the Tobacco Column. But neither any of my near relations nor myself touch tobacco. Father learned to use it when about eight years old, and was constant in its use until his sons were becoming "big boys" about him; then for their sakes he resolved to be its slave no longer, so he and four or five others, whom he induced to join him, pledged themselves to quit its use entirely for one year.

I was too young at that time to remember much about it; but I often heard mother tell about it afterward. Up to that time he had been a very stout healthy man; but during the first half of that year

he became very irritable, lost his appetite, flesh, and strength, to a great degree. In short, he became so miserable that mother, fearing he could not live the year out, besought him to begin using tobacco again. He said, "Well; I will die, if that is to be the end." He did not die then; he slowly but surely regained even more than his former vigor of mind and body, and lived to complete fully his "threescore and ten years." He often declared he was more than repaid in own person for all the struggle cost him. But the kind Father permitted him also to see each of his four sons become firm anti-tobacco as well as anti-whisky men, and still the good work goes on, for his three oldest grandchildren (cousins to each other, and already rejoicing in their privilege of voting for next President), as well as some younger ones, are each following in the steps of their fathers—so far, at least, as whisky and tobacco are concerned.

E. H. MCCLYMONDS.

Kittanning, Armstrong Co., Pa., Jan. 11, 1884.

There, friends, I got the above good letter by accident. You see, our friend got a smoker some time ago, which he said did not work very well, and so I told the clerks to send him one of the latest improved new ones, and this brought out the above story.

A REMARKABLE TESTIMONY, FROM FRIEND ROGERS.

Dear Friend:—It seems curious, perhaps, for me to address in this way a person I have never seen; but I can not but feel, after reading GLEANINGS for years, that you are indeed a friend, in the fullest sense of the word, and I can not longer refrain from writing you my thanks for the aid I have received from your writings. I like the Home Papers; and your Tobacco Column may have been the indirect cause of my leaving off the use of tobacco. At any rate, I jeered at it at first, and thought it a foolish addition to the pages of GLEANINGS. What I think of it now, I leave you to judge after reading.

MY EXPERIENCE WITH TOBACCO.

I have read with interest all that has been said in the Tobacco Column; but, not wishing to parade private matters before your readers, I had thought best not to say any thing about my experience with tobacco. But the honorable reports from W. J. Endley and others who have tried to abandon the habit, and so far failed, have induced me to speak out, with the hope that what I can say will not only strengthen all in their good resolutions, but may encourage at least one struggling brother until he shall at last succeed in freeing himself from the chains which the habitual and long-continued use of tobacco inevitably fastens about us. I say chains, because I consider no person more thoroughly enslaved than the one addicted to the every-day use of tobacco. To the veteran smoker I need say nothing to substantiate this statement; but to the youth just indulging in his occasional cigar, who thinks it mere fancy, let me say, bitter experience in after-life will show you that it is a substantial fact. You may ask how I know. I will try to tell you.

I commenced smoking a cigar occasionally when I was 16 or 17 years of age. At that time I had no thought of ever using the pipe. In fact, the daily sight of my loved father smoking his short clay pipe, although apparently a comfort to him, made me resolve that I would never use it. But as I got further along with the habit, a clean pipe was first substituted for the cigar, and finally appetite got the best of me; and even before I was 20, none but the long-

used, tobacco-stained pipe gave me comfort or satisfaction. My friends, it is with no little effort that I confess this; but it is the truth, and I am trying to tell the whole of it. As time passed on, and smoking hindered me at my work, the habit of chewing was easily acquired; and by this time my whole system was impregnated with the strength of tobacco. I soon began to feel some of its bad effects; and when I learned by my own experience that it was injurious, I concluded to leave off its use. I had always thought one could quit at any time; but a single trial convinced me of my error. I had used tobacco daily for years. It had obtained a strong hold on me. I tried repeatedly to leave it off, and as often went back to it after a few days. But one year ago to-day, Jan. 7, I thought, "I will not use any tobacco to-day." The next day I adhered to the same resolution. Another and another day followed without its use. There seemed to be some invisible power helping me. I began to feel that I should succeed this time, and, through the influence of GLEANINGS, the unspoken prayers of my wife, my own desire to set a better example before our three boys, and the help of that invisible Power, I did succeed, and am, to-day, thank God, a comparatively free man. I say comparatively, because I have not wholly got away from it yet. At times the old appetite comes upon me so strongly as to require a strong effort to resist it; but I have resisted it so far, and hope to continue to do so in future.

After an experience of about 18 years in the use of tobacco, I want to say to the young readers of GLEANINGS who may think as I did, that they can leave off at any time, never touch the first cigar. To those who have acquired the accursed habit, and now wish to abandon it, let me say, first think the matter over, and resolve firmly that you will leave it off. Do not wait until you use what tobacco you now have on hand, thinking you will then stop, for you will almost invariably buy more after a few days; but resolve that you will stop now. And having once formed this resolution, stand firm, and keep it with a will, not forgetting to ask in full faith for aid through Him who said, "Whosoever ye shall ask in prayer believing, ye shall receive."

On page 733, last volume, Mr. Root, you say: "If the use of tobacco be indeed an evil," etc. Now, the best physicians pronounce it injurious to health. Every candid, conscientious man who has used it will tell you it is an injury in many ways. As I look at it, whatever we do knowingly that injures our bodies is sin. As such, I hope you will continue the fight against it, and may unbounded success everywhere attend your effort.

For fear you may think otherwise after reading what I have written, I will say that, while I want to be a good man, I am not a professing Christian.

Again I thank you, friend Root; and may you long be spared to continue in the good work.

L. M. ROGERS.

Oneida Valley, N. Y., Jan. 7, 1884.

Thank God, friend R., for the news you bring of one more soul redeemed from the bondage of tobacco. And now, dear brother, let me beg of you to push right on and unite yourself with some body of Christians near you. Do not, I implore you, stand still, and by so doing possibly block the way for somebody else who may be just about to enter the gates of the kingdom. Stand up before men, and let your light shine, and

tell the story you have told us, and help others to push forward.

Blasted Hopes,

Or Letters from Those Who have Made Bee Culture a Failure.

I MUST confess, friends, that perhaps I have been a little careless in not looking a little sharper for reports for this department; and since we have been censured so severely by several of the friends for presenting only the bright side, here goes for Blast-ed Hopes.

I send you a little of my experience with my bees. I think that it may do for your journal, in Blast-ed Hopes, as I like to see all the departments kept up; but I think I shall try the black bee again before I quit. I shall keep the Italians for the coming summer again.

Well, in 1881 I bought one colony from Mr. A. Newman, of Chicago, in July, and a good one it was, and nice bees they were, and good workers; they increased to two, and gave 50 lbs. of honey; they wintered all right. In the spring of 1882 I bought a queen and 3-frame nucleus from Mr. W. P. Henderson, of Murfreesboro, Tenn. They came all right. Well, the queen soon had the hive full; they commenced to swarm, and they would swarm, and the young swarms would swarm, and all of her breed would swarm, all summer. Sometimes they would swarm when the hive would be only half full. By fall I had 15 colonies. Next winter, about 1/2 of them died. I ought to say I got about 50 lbs. of honey that summer from the Newman stock. Well, last spring I gave them the best care I could, after Doolittle's plan. I got no swarms nor a pound of honey. I made two new swarms from the whole, but I think they will die before spring, as they have not enough honey to winter on.

HUGH WILLIAMS.

Racine, Wis., Jan. 28, 1884.

Now, friend W., I thought the way you started out you were going to give us a tip-top "Blasted Hoper;" but come to sum it all up, it might almost do for Reports Encouraging. Why didn't you stick to your "Newman" stock, and let well enough alone? Perhaps the last queen was part *Holy-Land*.

I commenced the spring of 1883 with 18 stands of black bees—10 good ones, and 8 weak ones. The spring was wet and cold; no honey from fruit-blossom, and, in fact, no honey from any thing, so the black-jacks made for the saloons and wholesale grog-shops, and died by thousands inside of the windows; and the consequence was, Roop's bees petered out until there was not a handful to the hive left when basswood came out. Well I came out with 46 swarms, and 300 lbs. of comb honey in the fall. If I have any seed left, in the spring, I shall try it again, as I am determined to make bee-keeping a success, but shall Italianize in the spring.

M. S. ROOP.

Council Bluffs, Iowa, Feb. 11, 1884.

And so, friend R., it seems that saloons and wholesale grog-shops are as bad on bee-keeping as they are on Christianity, are they not? If we were going to have that state of affairs every year, I believe I should take the bees and move off.

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

OF READING MATTER.

MEDINA, FEB. 15, 1884.

We be brethren.—GEN. 13.8.

SEVERAL articles with illustrations in regard to reversible frames are in type, but no room for them in this issue. Look out for them next time.

BESWAX seems to stand still a little just now, and for immediate shipments we can furnish wax, common run, for 38 cents. We still pay 33 cents cash, 35 trade.

We are out of the July number for 1883, and will pay 5 cents for them till further notice. I don't dare to offer 10 cents just yet, because we got such a lot of them when we offered 10 cents for certain numbers a few weeks ago.

THE FLOOD.

MANY of the trains are stopped by loss of bridges, and therefore please don't be impatient if some of your orders are not filled as promptly as usual. The goods are loaded on a car, ready to go as soon as trains run.

ALSIKE CLOVER SEED.

I AM sorry, friends, but I can not help it. Alsiko has commenced already to go up, and is now worth \$12.00 per bushel; \$6.50 per half-bushel; \$4.00 per peck, or 25 cents per pound. If any one has any for sale, at a price not to exceed \$10.50, I should be glad if he would send a sample, and tell how much he has.

REPORTS in regard to wintering are at present very favorable. Severe weather in December and January seems to have done no particular harm. The warm, pleasant weather during the month of February seems to be quite universal; and in the Southern States, fruit-trees are in bloom, and honey is coming in plentifully.

CAN NOT VERY THIN FDN. BE USED FOR WIRED FRAMES?

THIS is a question that is coming before us repeatedly, and we have had a sufficient number of reports to settle the matter, I think. Of course, if the fdn. is made 8 or 10 square feet to the pound, bees will not have so much wax to build the comb; but as fdn. is now pretty high, and the thin will answer equally well to get all worker combs after there is no danger of the sagging of the wires, there is no objection that I know of, where one wishes to economize in that way. We can now make L. sheets for wired frames without much trouble, as thin as 8 sheets to the pound. Where the honey-flow was quite moderate, perhaps the bees might be more likely to bite the fdn. away around the wires, than with that which runs 4 or 5 sheets to the pound.

COMB HONEY IN CORN SYRUP.

OUR thanks are due to friend Aspinwall, of the *Bee-Keepers' Magazine*, for a report of the E. N. Y. B. K. A., over two yards long. The report is quite

valuable, but altogether too long for our pages. George House makes some very good remarks in regard to the adulteration of comb honey. Mr. Aspinwall follows up with a valuable paper. He tells that Thurber & Co., of New York, are putting up comb honey in glass jars with a label on it, stating that the liquid surrounding the honey in the comb is partly corn syrup, and is put in to prevent granulation. Now, if the corn syrup is nice, without any sulphuric acid about it (and I guess the Thurbers are equal to the task of furnishing pure and wholesome foods of almost any description), I do not see what is the harm, if people want to buy it so. Comb honey in glass jars must have something surrounding it that won't candy, if it is to be a success.

FEEDING IN FEBRUARY.

ONLY one colony of bees lost so far, up to to-day, Feb. 13. Many of them are full of brood, and quite a number have to be fed. As severe weather is liable to occur at any moment, we have decided to give them one-pound cakes of the old-style bee-candy, described in the A B C book. I have never fed any thing better or safer for winter feeding. We run it into the little square tins which we use for making one-pound maple-sugar cakes, and place this cake under the Hill device—over the cluster. I should not dare to commence feeding maple sugar so early. Another thing, the candy made of granulated sugar costs little if any more than the maple-sugar cakes, and it is certainly a great deal purer.

WITH the large increase of the subscriber list to GLEANINGS, comes a corresponding amount of matter sent in for publication. The quantity of manuscripts ahead is now so great that we can use but a small part of it; in fact, a great pile of long articles have been waiting not only weeks but months for me to get time to read them. Worse than all, quite a number of the friends insist on my giving space to matter that is, in my opinion, of only secondary importance. They urge that I have closed the subject at a point where it does them injustice. As the opposite party often feels the same way about it, there will be really no stopping-place; and so in default of being able to find a good place to stop, I have decided to stop in a bad place. In one case I am threatened if I do not allow the writer space to set himself right, before the people. Now, while I am anxious to live at peace with all men, if there has got to be a free fight to decide what shall or shall not occupy the pages of GLEANINGS, let the fight come; I am going to do what I think best and wisest for all concerned, not even forgetting our juvenile practitioners; and if I get some bruises in the fray, I will try to think I got them in what I thought to be a good cause.

CONVENTION NOTICES.

The Western Bee-Keepers' Association will hold the spring meeting, April 24, 1884, at Independence, Mo. C. M. CHANDALL, Sec'y.

The North-eastern Michigan Beekeepers' Association will hold its second annual meeting, Wednesday, March 5, 1884, at the Court-house in Lapeer. Hotel rates reduced to \$1.00 per day.

W. Z. HUTCHINSON, Sec'y.

The regular annual meeting of the Eastern Iowa and Western Illinois Bee-Keepers' Association will be held at Moore's Hall, No. 110 East Third Street, Davenport, Iowa, on Thursday, Friday, and Saturday, February 21, 22, and 23, 1884.

J. J. NAGLE, Secretary.

CIRCULARS RECEIVED.

W. S. Canthen, Pleasant Hill, S. C. sends us his price list of Italian queens and bees for 1884.

Howe & Son, Council Bluffs, Iowa, have sent us an 8-page list of hives, etc.; pages 6x3, map fold.

Henry Drum, Adelphia, Ohio, sends out a 14-page list of apiarian supplies. It is very nicely gotten up.

C. M. Goodspeed, Thorn Hill, N. Y., has mailed us a 4-page list of bees, queens, fowls, and small fruits.

We have just printed for Jas. M. Hyne, Stewartsville, Ind., his price list of things pertaining to the apiary.

E. H. Cook, Andover, Conn., sends out a circular containing prices of Italian bees and queens, rubber stamps, etc.

The Model Bee-hive Co., of Philadelphia, Pa., have sent us a postal circular of apiarian wares manufactured by them.

Oliver Foster, Mt. Vernon, Iowa, has just received from our press his price list of queens, bees, and molded fdn. Send for one.

We have just printed for Smith & Smith, of Kenton, O., their price list of bee implements. It is GLEANINGS size, and the "boys" consider it the best, in some respects, of any similar job they have done this season.

M. Richardson & Son, Port Colborne, Ont., have sent us a 16-page circular of things pertaining to apiculture. The book is 6x9, and reflects considerable credit on the printers, as compared with the average circular we receive.

A. H. Newman, Chicago, Ill., is sending out his regular annual illustrated catalogue, 36 pages. While the outward appearance of the list is much the same as last year, we notice that friend Newman has added quite a number of novelties.

Henry Alley, Wenham, Mass., has sent as a prospectus of his "Handy Book." Besides numerous testimonials, the pamphlet contains several illustrations showing the outline of his manner of raising queen-cells. It will pay you to send for this little prospectus, which is, we believe, mailed free.

F. G. & H. W. Bass, Orford, N. H., send us a circular, illustrating and explaining their circular beehive. The idea is to have a movable-comb hive as compact as an old-fashioned log gum. It is novel and ingenious, and no doubt bees may be managed so as to do almost if not quite as well as in any hive. But without ever having seen such in practical operation, I should feel as if it were twisting the bees a little, as well as their owner, to make them conform to it.

F. Koester, Roekenheim, Germany, has sent us his treatise on bee culture, containing 66 pages, 6 1/2 x 4. The ordinary German letters are not used in this book, but Roman is used instead. The whole work displays that laborious attention to details that characterizes our German friends. The printing is extremely good. In the back part of the book there are four pages of lithographic drawings, giving sectional views of the different articles made. The price is one mark—about 25 cents.

Honey. ✠ Honey.

Great quantities of it, and great quantities of choicest fruit from new Cuthbert raspberry. I have really found a good thing at last. It is the largest and best red raspberry grown; so say those who have tested it, and so say I. Will stand heat or cold, wet or drought. Have tested it now for two years, and am really surprised at the quantities of honey gathered from the blossoms; and that, too, when but little is gathered from any other source; bees continue to work on them four weeks.

I make more money from the crop of berries alone, than from any crop grown on the farm. A limited quantity of fine plants for sale; 1 1/2 doz. for \$1.00 by mail, or \$3.50 per 100 by rail.

4-6d DIC. B. F. KINNEY, Bloomsburg, Penn.

FOR SALE.

50 SWARMS ITALIAN BEES in Simplicity and improved American hives.

4-5d S. ALBRIGHT, Monroeville, O.

HIVES. 1884. HIVES.

SEND for new price list of supplies for the apiary. Hives by the 100 in flat cheap, and best quality. Also rakes and cradles. White's pat. wire brace rake, best and most durable. Send for price by the dozen.

A. D. BENHAM,

47d-b OLIVET, : EATON CO., : MICH.

WANTED !

Orders for Italian queens and comb foundation. Italian queens, untested, before June 1. \$1.50; after June 1. \$1.00. Italian queens, tested, before June 1. \$2.50; after June 1. \$2.00. 10% discount on orders of 5 or more to one address. Printed directions for introducing queens sent with each queen.

Comb fdn. made of pure beeswax, 1 lb. to 10, 60c. per lb.; 10 to 50, 55c.; 50 to 100, 53c. For thin fdu. for section boxes, add 5c. to above prices.

We guarantee safe arrival of queens by mail, and fdn. by express or freight, to all parts of U. S. or Canada. Cash must accompany all orders. Send money by P. O. order, registered letter, or draft. Address all orders to

KENNEDY & LEAHY,

For Sale Cheap!

FARM OF 160 ACRES,

Good land, 80 acres under cultivation, the rest growing timber (oak), fenced for stock; good stock farm, two wells on the place, one soft and the other hard water. There is a Halliday windmill near the house, for pumping water for stock and house use. And a Challenge windmill (8-horse-power) and feed-mill for grinding feed for stock. A large amount of custom work is done in windy weather, when but little else can be done. The mill is entirely new, and cost (including building, which is 2-story) about \$900. There is a good new house, finished inside and out, main part 16x26, 2 story, wing 20x24, and a good stone cellar under it. It is a good farm house, and is well finished; cost nearly \$1000. Good new barn, 30x41. Cattle barn, 12x56. Granary, 12x32. Honey-house, 12x16; also, wood-shed, wagon-shed, corn-crib, hog-pens, etc. All the above for only \$3000—one-third down, remainder on time, to suit purchaser. Interest at 7%. Will sell all the farm machinery and stock, if desired, and our apiary of about 50 colonies, and all fixtures, very cheap.

CITY MARKETS.

CHICAGO.—Honey.—Comb honey is being taken in a small way. Prices are without change of special note for the best grades; off grades are slow at almost any price. Extracted honey, 7 to 10c.
Beeswax scarce at 30 to 36c. per lb.

R. A. BURNETT,
 Feb. 21, 1884. 161 South Water St., Chicago, Ill.

CLEVELAND.—Honey.—Continues a little dull; sales are small, not frequent; prices, however, unchanged. Best No. 1, white 1-lb. sections, sell at 18@19c; 2 lbs., 16@17c. Glassed, 2c less. Second quality is dull at 14@15c. Extracted, no sale. *Beeswax* scarce at 30c.
 A. C. KENDEL,
 Feb. 22, 1884. 115 Ontario St., Cleveland, O.

ST. LOUIS.—Honey.—Our market continues dull for extracted honey. No demand in bbls.; quoted 6 to 7c. Nominal, in small cans. Retail, 10c. Comb honey, only a retail demand, 13 to 16c. White clover wanted; would bring 18 to 20 cts., in good order.
Beeswax continues scarce. Very little arriving; 35 to 37½c. Look for higher prices.

W. T. ANDERSON & Co.,
 St. Louis, Mo., Feb. 23, 1884. 104 N. Third St.

KANSAS CITY.—Honey.—Choice white 2-lb. sections still scarce, and wanted at 17@18c; 1-lb. sections in fair supply at about same prices. Dark comb very slow at any price. Extracted, dark, in light supply, and fair demand at 8@8½c. White, rather slow.
Beeswax—None in this market.

JEROME TWICHELL,
 Feb. 21, 1884. Honey Depot, 514 Walnut St., K. C.

BOSTON.—Honey.—No change in price of honey. Demand light; 1-lb. sections selling 18@20c; 2 lbs., 16@18c. Extracted, 9@11c. *Beeswax*, 35c.

BLAKE & RIPLEY,
 Feb. 23, 1884. 57 Chatham St., Boston, Mass.

I have one barrel of nice white-clover honey in alcohol barrel, iron hooped, and waxed, for which I will take 9 cts. per lb., delivered on cars at Elizabethtown, Ind.

NOTES FROM THE BANNER APIARY.

NO. 52.

BLASTED HOPES.

I HAVE just "counted up," and there are twenty-three persons living within two miles of my place who have invested in bees since I started in the business, the majority of them being induced to embark in the speculation from witnessing my own success. All except two were farmers, and many of them went into the business quite extensively, bought bees, and transferred them to movable-comb hives, Italianized them, bought an extractor, smoker, honey-knife, fdn, sections, etc., and of all these twenty-three neighbors who thus thought to either make money, or to "raise honey enough for their own use," only two now own bees—one has four colonies, the other one—and the only one who ever made any clear profit at the business has now dropped both bee-keeping and farming, and gone to the city as a book-keeper, while the majority expended enough money, to say nothing of the time, to have bought from two to ten times as much honey as they ever obtained. In speaking of being obliged to go "hawking" our honey about in order to sell it, I did not exactly mean that we were obliged to go upon the streets, or to peddle from house to house, but rather from store to store, or from dealer to dealer, and this isn't the worst of it; *we can not always effect a sale, even at the wholesale market price.* With almost every other "raw" imperishable product, we can load up and drive to town and "sell out" at the market price.

QUEEN-EXCLUDING HONEY-BOARDS.

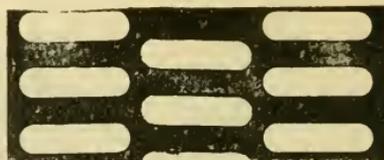

When I adopted the Langstroth hives, and turned my attention to the production of comb honey, I used the Heddon skeleton or slat honey-board between the brood-nest and the surplus department. This honey-board deters the bees from extending small pieces of comb upward from the brood-combs, and connecting them with the lower bars of the section boxes; it also discourages, but does not always prevent, the queen from leaving the brood department of the hives. In old colonies having a full complement of brood-combs, only in one or two instances did the queen enter the surplus department, and then only slight damage was done; but when prime swarms were given access to the surplus department at the time of hiving, the queen almost invariably caused much trouble by going at once to the honey-boxes and filling them with eggs, while the frames below would be filled with honey. To remedy the difficulty, I tacked narrow strips of tin to the bottoms of the slats composing the skeleton honey-boards, allowing them to project over sufficiently to reduce the spaces to the merest trifle less than 5-32 of an inch. To keep the slats exactly in position, three strips of tin were tacked crosswise of them. Upon trial, the queens could not pass through these honey-boards (I caught a queen and forced her into one of the spaces, and she could not extricate herself), while quite as much honey was placed in the sections as before. Afterward, in making honey-boards, the slats were made 5/8 wide, and placed the proper distance apart; and, when finished, the boards were painted. To give it a trial, I ordered enough zinc to make honey-boards for ten hives. The most

serious objection to the zinc is its cost. With me, no queens have passed through it, and I have reduced the size of the brood-nest until the frames were so full of brood that it did seem as though there was not more than one-fourth of a pound of honey in each frame. The zinc is inclined to sag in the middle, and thus reduce the space in the center to *less than bee space*, when the bees glue them down; and when they are removed, as J. B. Colton says, "they get kinked some." A wooden honey-board is *always straight*, which keeps the spaces perfect, while it is more easily removed than a zinc honey-board, which will bend when taken off, unless it is first pried loose all around, and even *then* if stuck fast in the middle. I think the point made by J. O. Pearce, on page 10, in regard to the queen being less apt to pass through a wooden honey-board than through a zinc one is well taken, and I am at a loss to see why you, friend Root, should say that you "had no faith in wooden honey-boards for retaining queens, and not much for keeping out drones either." I used about 50 of these wooden queen-excluding honey-boards last season, and I *prefer* them to the zinc. As J. B. Colton says, when a queen-excluding honey-board is employed, "Your combs below will have no honey in them, as the queen completely monopolizes them, and the honey is shoved up stairs." W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich.

Friend H., the case you bring forward, of your neighbors who have abandoned bee-keeping, is indeed something to be looked at seriously. And since you suggest it, I find it has been a good deal so in my own county. Perhaps as many as you have mentioned have commenced bee-keeping around here. After a year or two, a few of them raised some pretty large crops of honey, disposed of it to good advantage, but as time passed, most of them changed around into something else, or went back to farming, and let their apiaries run down through neglect. Our neighbor Shane is almost the only one who is keeping abreast of the times, and making it a paying business year after year. Many of them are a class of people who would neglect almost any business, and have gone into other things since they dropped bees, and had about the same experience. Perhaps I should mention, that quite a number of the farmers living near here have turned their attention to selling bees to me instead of producing honey, and I believe they have done pretty fairly. Our neighbor Rice is one of these.—In regard to the honey-boards, I have had little faith in any sort of a wooden arrangement for restraining queens, because we tried it so many times at the time we were all excited about fertilization in confinement. A great many of us imagined we had succeeded; but careful watching showed that the virgin queens went through almost as small a place as worker-bees; and late reports which have appeared in GLEANINGS indicate that queens get through the Jones perforated zinc as well. I was greatly interested in the words you use in your report above, where you say, in adjusting the tin strips, you made a space "the merest trifle less than 5-32 of an inch." Now, friends, I have had an idea that worker-bees can get through a smaller space than Mr. Jones makes in his perforated zinc, and to test it I have had made 1000 square feet of perforated

zinc with meshes in like the cut below. In fact, this cut is an imprint of a bit of the zinc itself:

PERFORATED ZINC, WITH SMALLER PERFORATIONS.

Worker bees can get through this; but the only trouble I anticipate is, it will scrape off the pollen wares than the Jones zinc. But if we can not use it in restraining queens and drones, I shall use it for wax-extractors. I am glad to be able to say, we can furnish it to you, cut into sheets of any size, for 15 cts. per square foot; or for whole sheets, 3x7 or 3x8 feet, as you choose, at a cost of \$2.50, and \$2.85 per sheet respectively. I hope somebody whose bees are now bringing in pollen will make a test of it at once.

DRONE-TRAPS AND QUEEN-GUARDS.

SOME OF FRIEND ALLEY'S INVENTIONS.

MR. LANGSTROTH has lately called our attention to the usefulness of some kind of a bee-guard which may be placed at the entrance of the hive to prevent the exit of the queen in swarming. My profession being such that I must leave my bees to their own sweet will on those pleasant Sabbaths when they are so inclined to swarm, and my interests being called out toward any thing which will diminish the interference of bee-keeping with church attendance, I have taken a practical interest in any device which will control swarming. Of course, any guard which may be placed at the entrance of the hive to prevent the queen from leaving will also prevent the drones from leaving. Such a device must be founded on the fact that a 5-32 space will admit a worker-bee, but will hinder a queen or drone.

D. A. Jones's perforated zinc comes into most happy use to construct such a queen and drone guard. There can be no question but that a guard or a trap placed at the entrance of the hive, which will give the workers free exit and admission, and yet which will stop the queen from leaving, and will catch every drone in the hive, would be a great convenience in a variety of ways. Such a device, to be practical, must not hinder the work of honey-gathering, nor must it interfere with the ventilation of the hive, for it must be used in the hottest weather. I have sent and obtained two of these bee-guards, or traps, of two different makers, and I wish to explain each and mention some of the advantages which may be derived from their use. The first that I sent for was the one made by A. I. Root, after the general pattern of that made by D. A. Jones, its originator. It is simply a little box made of perforated zinc, 9/16 inches long, and 1/8 of an inch high and wide. It has no bottom and no back side, but only a top and front side. The zinc of which it is made is perforated with oblong slits about 1/2 inch long and just 5-32 wide. There is a row of slits, and then a row of solid zinc, furnishing two rows of perforations in the

front of the box, and two rows on the top, through which the workers can pass in and out. This zinc guard is set up against the entrance; and while the workers can go in and out through the perforations, the queen can not get out, neither can the drones. Now it seems to me, a guard made on this principle has some uses, and it also has some defects. It could easily be slipped over the entrance after the drones are on the wing, and compel the luckless lubbers to cluster on the alighting-board outside to await execution. By putting it on, day after day, after the drones have mostly come out of the hive, they can be gradually exterminated from any particular hive, by preventing their entrance again. And after the drones have been thus exterminated from a hive, this guard could be put on to catch the queen when the swarm comes out. The simplicity and cheapness of this little guard are also in its favor.

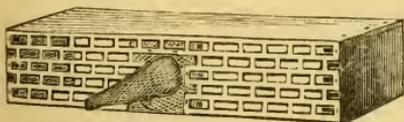

But it seems to me such a bee-guard accomplishes only a small part of what a drone and queen trap should. I should hesitate to put such a guard against the entrance of a large swarm abounding in drones, on a hot July Saturday night or Sabbath morning, and go to church feeling that my precious queen could not leave with a swarm. This little guard is only $\frac{3}{4}$ of an inch square, in a cross section of it, and $9\frac{1}{4}$ inches long, and it will not hold half the drones which some hives contain. I should fear the result would be, that the drones would clog up and entirely fill the guard, and my queen and all her colony would be in danger of suffocating.

The second bee-guard I sent for was a drone and queen trap made by Henry Alley, of Wenham, Mass. It is a wooden box $9\frac{1}{2}$ inches long, $5\frac{1}{2}$ high, and $2\frac{1}{2}$ thick. This box has two stories, or apartments, the lower story $1\frac{1}{2}$ inches high, and the upper taking the rest of the box. Imagine an old-fashioned meal-chest with the ends extending down about a foot for legs, and a second bottom nailed on to the ends of these legs, and you have a large-sized illustration of this trap. The lower apartment is open behind, and has perforated zinc nailed on in front, and it is designed to give free outlet to the workers, and free ventilation to the hive, being a "down-stairs" entry, with a perforated zinc door $1\frac{1}{2}$ inches high and $9\frac{1}{2}$ long, leading straight into the entrance of the hive. The upper apartment of this trap is about $3\frac{1}{2}$ inches deep, the whole of the box above the lower apartment just described being included in it.

Georgetown, Mass.

D. D. MARSH.

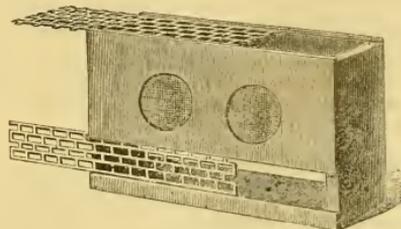

Perhaps I can better explain to our readers friend Alley's invention, by a couple of illustrations. The first one, which is the simplest form, is shown below:

ALLEY'S MACHINE FOR EXPELLING DRONES FROM A HIVE.

You will observe, friends, that this is simply an ordinary bee-entrance guard, such as we sell, only a little enlarged, and having the ends made of wood. Besides this, a wire-cloth cone is put into the center of it. When the drones find themselves unable to get

through the perforated zinc, they of course seek the wire-cloth cone, or funnel, and go right out without any trouble. Workers can also go out of this cone, if they wish to. No bees or drones will go back that way, however, for they will all march right up to the perforated zinc, without seeing it; therefore the way it works will be to let all the drones go out that want to go out, but none ever get back. Your drones will therefore be found in front of the entrance at night, and may be destroyed. They may, however, go around to other hives to seek an entrance; and unless all hives in the apiary are provided with a similar machine, you would not get them. This arrangement would, however, have no effect on swarming, for the queens would go through the funnel just as easily as the drones do.

ALLEY'S DRONE-EXCLUDER, DRONE AND QUEEN TRAP COMBINED.

You will readily understand from the above drawing, that the cones (which can be dimly seen through the circles of wire cloth), instead of being placed in the perforated zinc, as before, now both open upward into a box above; and this box, being covered with the perforated zinc, permits any workers to get out at once, if they happen to get into it. All the drones are simply boxed up until needed; and if there be any swarming, the queen also goes up into the drone-box. The swarm comes back and goes into the hive, remaining contentedly, probably because their queen is caged right in the entrance, and she is there safe until the owner returns from meeting, or wherever else he has gone. I must confess that this seems to me a pretty nice thing. The only drawback I think of is, that the queen may get through this perforated zinc. You know how many reports of late that they have done so. The new zinc, with smaller perforations, figured on page 150, may fix the whole business, and probably will, if it does not worry the bees and scrape off the pollen. In the figure, the perforated zinc is shown, partially drawn out. This can be easily done at any time when you don't care to use the drone-catcher.

Now, friends, the next we are to do is to have a tube from this queen-cage, leading to a new hive all properly rigged, fixed in some way so the returning bees will go into it, and we have an automatic swarmer that does not have to swing around or keel over or go through any such antics. The only thing lacking is to get the entrance to the old hive turned away, or changed in such a way that the bees when they come back will cluster around their queen in the new hive. Who will work it out? You will find the

prices of friend Alley's drone-traps in our advertising columns, and you can order them of us, if more convenient.

THE WAY FRIEND HOUSE USES REVERSIBLE FRAMES.

ALSO SOMETHING IN REGARD TO QUEEN-REARING, AND THE PERFORATED ZINC.

FRIEND ROOT:—I am overrun with inquiries in relation to honey-racks, reversible frames, and queen-rearing. I have not time to reply to these communications, and therefore send you by express some samples. The honey-rack I send is intended to set directly on the tops of the brood frames, thus leaving a space of $\frac{1}{4}$ inch between bottom of section boxes and top of brood-frames. I am not troubled by the queen getting into the surplus boxes, and depositing eggs, etc.; neither do we find any comb built between boxes and brood-frames. The rack is made for the $5\frac{1}{4} \times 5\frac{1}{4} \times 2$ -inch sections, and holds 21 boxes; the separators rest upon the end-pieces, which leaves the proper space for entrance into the sections. They can be tiered up as well as any rack I have ever seen.

The strip containing the tin and the staples will represent the bottom-board of hive. Either the tin or the staples may be used. I prefer the latter. They should be driven into the bottom-board, both across the front end and near the rear end of said board, and should be $1\frac{1}{2}$ inches from center to center. The reversible frames rest on these staples. The staples in the center of end-pieces of frames sent will keep the frames at the proper distance from the sides of hive. I send 3 frames—one a closed-end frame, and the other two will show how any hanging frame can be made reversible. The one, you will notice, has pieces tacked on sides of end-bar of frame, to keep them the proper distance apart. The other is an old L. frame, with projections sawed off and made reversible, the same as can be done with any frame. I think you will find no trouble in seeing into the workings as described. If you do, write, and I will try to explain further.

I prefer the closed-end frame. I believe we shall soon see and learn the valuable points in the closed-end standing Quinby frame. Had our lamented Quinby been spared, I believe this point would have been brought to light ere this, and I think he had this one of many good points in view when he invented that frame. GEO. W. HOUSE.

Fayetteville, N. Y., Feb. 7, 1884.

I will explain to our readers, that friend House's reversible frame is on the plan of the Quinby closed-end frames; in fact, you will notice that he predicts that these are going to come into general use. His frame, however, is supported by a strip fastened to the bottom-board of the hive, both front and rear. Staples placed at proper distances in these strips space the bottoms of the frames. The frames are held the right distance apart at their tops by nails or staples driven the proper distance. They are, also, held from striking against the ends of the hives by the staples. Of course, these arrangements are all old. Having the frames made closed ends at all, or even a part of their lengths, would obviate the necessity of the nails. In connection with this, I may remark that friend H. also suggests a reversible hanging frame by putting a stout screw through the center

of the end-bars. An ordinary tin rabbet is then placed half way down the ends of the hive. The frame can now be used either side up. But we shall be obliged to use spacers of some kind, or the frames will always be tipping over. Spacing nails or staples have been for a long time abandoned, by almost universal consent, and I hardly think they will obtain favor now. Friend House's rack for holding sections differs but little from many in ordinary use. Sections are held above the brood-frames by strips one inch wide and $\frac{1}{4}$ inch thick, these strips running crosswise of the hive, and supporting the ends of the two rows of sections. Many good bee-keepers use a similar arrangement, but I really can not understand how anybody can consent to let the bees get directly at the under side of the sections, to cover them with wax and propolis. I know, that at certain times, and with certain colonies, we do not get much wax or gum placed on the sections, even if left thus exposed; yet at other times they will all be covered with bits of comb and propolis. Why not have the whole section protected, so the bees can get at them nowhere, except where they go in at the entrances? In regard to queen-rearing, friend House writes as follows:

QUEEN-REARING.

That the queen-bee is the foundation of successful apiculture, none will dispute; therefore it behooves us to be very careful in the selection of the mother queen or queens. If the bee-keeper has no queen that fills the bill, or that comes up to the desired standard, it will be far better and cheaper to purchase such as have the desired qualities, even at a cost of fifty dollars. Above all, I would advise against breeding from Italian queens that have become fecundated from German or hybrid drones. The worker progeny of such queens may be desirable to some; but each succeeding generation will deteriorate in value, unless the amount of Italian blood be increased with each successive crossing. Italians and Syrians are far different. A cross between these two races produces our best strains of workers. Many writers claim that we should not breed from queens more than two years old; in this I must disagree with them. I prefer a queen at least three years old and older, if she retains her vitality. How can we test the qualities for wintering—endurance, longevity, &c., when discarded at the end of two years? Some of the finest queens I ever saw were superseded queens, reared to take the place of five-year-old mothers. I will not discuss this point any further here, but will proceed to give what I claim to be the best as well as the most simple method of rearing queens I have yet learned or heard of.

To be better understood, I will first describe the hive used, and its arrangement. In this, hinges the success of this method. The hive is constructed for 11 frames, $11\frac{1}{2} \times 12\frac{1}{2}$, outside measure; but instead of using 11 frames, we use only 8, using two wide frames containing four $5\frac{1}{4} \times 5\frac{1}{4} \times 2$ sections each. Place one of these wide frames on each side of the eight brood-frames. The wide frames are made so that they go inside the hive with ease. On one side of each wide frame nail a sheet of Jones's perforated metal, covering the entire side of said wide frames. The colony having our best queen, with her wing clipped, being in such hive, we will proceed with the

manipulation of the colony for the end in view. After the fruit-tree bloom, this colony should be stimulated by feeding a little honey or sugar syrup each day, so as to keep the queen laying in her full capacity. The same end may be accomplished by giving frames of solid brood about to hatch, taken from other colonies—the *object* being to have the hive crowded with bees as early as possible, thus inducing the swarming fever. As soon as the colony has constructed queen-cells that are nearly ready to be sealed over, preparatory to swarming, open the hive and take four of the eight brood-frames having the most and the best queen-cells thereon, and place them to one side of the hive after removing the wide frame. Now take the remaining four brood-frames and destroy all queen-cells thereon, and place them to the other extreme side of the hive, after removing the wide frame on that side. Now place the two wide frames in the *center* of the hive, with the perforated metal sides toward each of the two brood-nests, thus dividing the hive into two compartments, the queen being in the side containing no queen-cells. We now close the hive, and await the results. The bees go all through the hive at pleasure, but the queen is confined to one compartment, containing only four frames.

The colony already having the swarming fever, and the queen restricted in her egg-laying capacity, will in one or two days start new queen-cells. The bees will complete and nurse the fine natural queen-cells on the four frames at the other end of the hive. When a day or two before these first-constructed queen-cells are ready to hatch (about eight days) open the hive and cut out and use these cells; at the same time take the queen from the other side and place in the side from which you have just removed the cells. On the four frames from which we have just taken the queen we will find a lot of very fine natural queen-cells about ready for sealing. These the bees will complete and nurse to maturity. The queen, now having empty cells, will immediately go through the compartment (or four frames), depositing eggs in all vacant cells, when *new queen-cells* will be constructed. Just before the cells on the other side of the hive are ready to hatch, cut them out and use them, and put the queen on that side. Proceed in this way as often as the queen-cells mature, which you will find to be about every 7 or 8 days. In this way our cells are all reared in very powerful colonies, and containing brood in all stages, at all times. The cells are reared in a perfectly natural way, and under the swarming impulse. We have a laying queen in the hive at all times, and the colony is also storing surplus honey in the sections right along. You never saw finer nor better queens than those reared in this way.

If we do not let any young queens hatch in this hive, nor allow a queen-cell to be capped over in the part containing the queen, the colony may be kept building and rearing queen-cells until late in the season; and the colony will not attempt to swarm—at least, such has been my experience. The sections in the wide frames should be removed as often as filled, and replaced with new ones. I do not allow this colony to store any surplus on top of brood-chamber.

A GOOD REPORT FROM THE PERFORATED ZINC.

I have thought many times, after reading of the failures of those who reported their experiences (in GLEANINGS) with the Jones metal, how near they came to this plan, and yet failed to see the value of

this perforated metal, but instead they cry failure, without knowing whereof they speak. This should teach us to be careful and searching in our experiments, before denouncing any thing as a failure. If one bee-keeper can succeed, others can. If we fall the first time, commence anew, and study our experiment as it progresses, step by step, until we find wherein we failed. In this way we will many times discover something new, and still accomplish the desired feat. I am pleased with the perforated metal. It is a success with me, and will be with others as soon as they learn how and where to use it. I believe it will be indispensable in the near future. By placing the entrance-guards at entrances of such colonies as are liable to be attacked by robber bees, such colonies will and can protect their homes to a great deal better advantage.

PERFORATED ZINC FOR DISCOURAGING ROBBERS.

It is seldom you will find a robber-bee to venture under one of these guards, especially when there are any bees acting as guards at the entrance. Robber-bees will not venture where they can not readily get away, unless the robbers have already gained a foothold. An ounce of prevention is worth a pound of cure.

G. W. HOUSE.

From the above description, I take it for granted that friend H. has his wide frames close fitting to the sides of the hives, although I may be mistaken. Very likely two frames of sections placed in the center of the hive, separating the brood combs, will be sufficient to keep the queen from passing around them, provided the frames were covered with perforated zinc in the place of separators. I have often reared two queens in a hive by using combs of honey to divide the brood, and I should think the point brought out in the above might prove an excellent one. I am quite sure the drone-guards would aid a colony in keeping robbers at bay, as suggested.

BUYING AND SELLING BEES.

HOW SHALL WE MEASURE OR WEIGH THEM ACCURATELY?

THERE are at present three ways by which bees are bought and sold; viz., in full colonies, in nuclei, and by the pound. A full colony is supposed to be what bees and brood may belong to a hive of combs of a specified size and number; and the purchaser knows but little about how many bees he is getting when ordered from where he can not examine them before buying. A certain number of combs, of a specified size, containing brood and bees, are sold as a nucleus; and, like the full colonies, are as liable to vary as a politician's principles, and the buyer may or may not get a good bargain.

But when a man buys bees by the pound, he knows just what he is getting; for when his bees arrive, he can weigh them in the cages, then open the cages, let the live bees run out, weigh the cages again, and figure up just how much the live bees weighed; and if not as much as was ordered, sends bill for the difference; and, of course, the dealer sends on enough to make up the deficiency.

Now, this would be just the way to buy and sell bees, were it not such an unnatural condition for the bees to be in while in transit, causing so many to die that the loss is too great between the seller and buyer.

Though I have sent bees hundreds of miles, by railroad and stage, with no complainable loss; yet again, with them just as carefully packed, at less distance, the loss has been enough to almost condemn the business. That uneasy, discontented buzz of bees caged for transportation by the pound, is a sound any thing but pleasant to my ears.

Far the best way in which to ship bees, for all parties concerned, and especially for the bees, is mostly in the brood, estimated by the thousand. This can be quickly done by measuring the patch of brood with a rule, finding how many square inches it contains, dividing the number of square inches by 2 (where the brood is about the same on both sides of the comb), and you know just how many hundred bees there are in the comb; for bees in the brood lay just about 5 to the inch each way. But, what are bees worth per thousand? We have got used to estimating them by the pound, so we will reduce it. I have found by actual count, that 120 live Italian bees weigh an ounce. Friend Root estimates them at 125 to the ounce, or 4000 to the pound, and that is near enough for all practical purposes. Then when 1 lb., or 4000 bees, are worth \$2.00, one thousand would be worth 50 cents. For example, a party orders of a dealer 40,000 bees. The dealer having light, but strong cases prepared in which to send them, goes to his hives, selects the best-filled combs he can find, each comb containing some honey, as well as the brood. He places his rule on the patch of brood, finds it about 7 in. deep by 11½ long, makes 80½ square inches, divides by 2, and has 40¼ hundred, or 4025 bees; marks it down, puts the comb in the case, and proceeds the same with the next, and the next, until he has, say, 29,000 bees, in all stages of brood. He then sets the cases on the scales, takes the weight, then brushes live bees enough on to the combs to make 11,000, which is 2¾ lbs., shown by the scales, thus the number ordered is made up. The live bees take care of the uncapped brood; the honey furnishes food; all feel contented, and, though confined, and on the road for days, there will be no loss.

When the buyer receives them, he can weigh and measure the bees and brood, if he chooses, and thus know as accurately what he has secured as though they were loose in a cage, and ¼ to ⅓ dead. But generally, those who wish bees by the pound don't want the combs; in that case, let the buyer select from his own stock of combs, some as nearly like those received as possible, inclose them in the cases in which his bees have come, and the express company will return them to the shipper free of charge. If it is not desirable to exchange combs, the cases and combs can be detained until the bees are all hatched, and then returned.

The buyer will need to order a little earlier, to have his bees out, and ready for business at the desired time. It is always a satisfaction to all parties concerned, to be accurate in deal. But the old way of buying bees by the colony, or nucleus, is so indefinite, that the plan of buying them by the pound is fast growing in favor. And while accuracy is a very desirable feature, let us manage the matter so that our pets shall not be the sufferers in consequence.

S. C. PERRY.

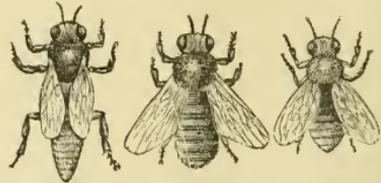

Portland, Ionia Co., Mich., Feb. 18, 1884.

Friend P., you have hit upon a very important matter indeed, and I would accept your suggestions with alacrity, were it not that you have overlooked one very important point. Bee-keepers do not have brood-frames all of one standard size. We have tried filling orders with Simplicity combs,

until we had such grievous complaints that I was obliged to give it up. One friend said he would not have such great long shallow frames if they were given him for nothing; and as he couldn't get them into any hive he had, he let the brood die, and wanted us to pay for it. Sending bees in a cage by the pound, makes it all pleasant; for no matter what the hives are, the purchaser can just shake the bees off on his own combs, or on his own frames, filled with brood, if he chooses, and every thing is lovely, for the bees themselves are all of one dimension. Isn't that lucky for us, friends? I know what you say about a little brood making the bees contented is true, and I almost begin to think about having narrow sections containing brood, so we could get one into every bee-cage. But, alas! we have tried it, a great many of us, and it is a real task to have a little frame, the size of a section, always at hand containing some brood. I really do not see any way in our shipping business, but to send bees in cages by the pound, although I do know that a one or two frame nucleus is much more likely to be all right every time. May be we are coming nearer to a standard frame than we were a few years ago, for our A B C pupils are pretty sure to have the Simplicity frame, and nothing else. Your idea of buying bees in the form of sealed brood, instead of live ones that can buzz, and have to be fed, is a grand one, and combs of brood can always be had in abundance in warm weather; and where built on wired combs, they can be shipped anywhere, almost without the possibility of the loss of a single bee.

PICTURES OF BEES.

WE have been working about two months to get accurate pictures of the queen, drone, and worker; and although I am not quite suited with them yet, I submit the result to you below.

QUEEN, DRONE, AND WORKER.

The worker is one we took from a photograph. The drone was figured out from the best cut and drawings we could hunt up. The queen was also taken partially from a photograph. If they please you, we can furnish you the whole set for 40 cts. If they don't please you, I wish you would try your hand at it, and see if you can not give us some better ones. I believe the best picture of queen, drone, and worker that I ever found anywhere are in Iluber's book, published in 1841. They are colored steel plates; but as they represent black bees, they are not quite what we wanted. We did not receive them until after we had made the above, and I really have a notion to try to make some copies of them.

OPENING BOXES.

ALSO A WORD IN REGARD TO THE CARE OF EMPTY BOXES.

ONE of the worst troubles I have in our establishment is to find boys who will open a box carefully, put the cover back in place, and go and put it back in the box-house. It sometimes seems as if they had been instructed at home to smash every thing in the shape of a box they got their eyes on. If they don't do that, almost the best of them will take the cover and lay it down somewhere, and somebody will come and take it for something else; and then when the box is wanted, a cover has to be made of unsuitable lumber, and it goes to our customer looking so cheap and patched up that I am ashamed of the workmen I employ. "Please don't break the covers, boys," and "Please don't forget to put the cover on nicely, and put the box away where it belongs," I urge and plead and implore and entreat; and after working hours, when the poor fellows are gone, and may be sound asleep, on my knees I pray that God may help them to be more careful, and learn wisdom's ways. Notwithstanding all these pleadings, I have oftentimes said to myself, "Oh for a boy, just one boy, who would love to open boxes carefully, and to put the cover back carefully, and then to pile them up in the box-house carefully, until somebody wanted just such a box!"

So much for my trials. Now comes the question, How shall this imaginary boy get the top off without breaking or splitting it? I once saw Gen. Leggett open a pine box with a hatchet. The great man was careful, but it took him a long while, and I was wondering at the time whether he thought as I did, about box-covers. Well, we have tried a good many tools for opening boxes, and for many purposes we like the one figured

alongside of these remarks best of any. The manufacturers call it the Pelican nail-puller. To use it, you put the claw just before the nail-head, and strike it on the back

with the hammer till it catches the head, and then tip it back. They are nicely tempered, and we used one a long while before anybody could break it. If you will take a look at a box you will almost always discover that, to get out the contents, you do not need to take the whole cover off. If it is a large box, and the cover is made of three pieces, just get out the end nails of the middle piece, and very likely your goods will all come out very easily through this opening. If the cover is made of two pieces, draw the nails from just one only. Don't pull the nails clear out, but leave them sticking in

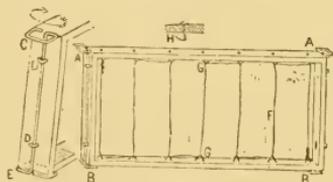

the cover; then when you have removed the contents, put the cover right back, and set the nails down just where they went before. If the goods are packed in straw, have a basket near for the straw, but don't scatter it on the floor. If you know just where the goods are to be put, carry the box to that place, and put them away with one handling. If they go on a shelf, set the box on a high stool, tight up to this shelf. Then you will get the goods where you want them, with no waste handling; for every time you handle goods, it takes time, if it does not damage the goods by breakages.

The price of this Pelican nail-puller is 75 cts., and it can be sent by mail for 18 cts. That convention in York State objected to GLEANINGS, because I used its pages to advertise so many things. Now, friends, I expect to advertise goods that I find handy, as long as I live; and when I describe them, I expect to give prices, and you can tell whether you can get your blacksmith to make them cheaper, or whether you can get them cheaper at the hardware store. If you can, by all means do so; and if you can't, I shall be happy to assist you.

CONCERNING FRAMES.

SHALLOW FRAMES; THE NEW PLAN OF WIRING FRAMES; ALSO A SIMPLE AND PRACTICAL WAY TO REVERSE BROOD-FRAMES, AS WELL AS WIDE FRAMES, AT THE WILL OF THE OPERATOR.

FRIEND ROOT:--Herewith I send you by express the style of brood-frame I prefer for my own use, and the one I have been using more or less since 1876. The frame, as you will notice, is more shallow than the standard Langstroth, being only 7 inches deep and 16 $\frac{1}{2}$ inches long, inside measure; 7 $\frac{1}{2}$ inches deep and 17 $\frac{1}{2}$ inches long, outside measure. The frame being reversible, I make the top and bottom pieces, as you will see, of the same thickness. I prefer to make my frames now, top, bottom, and end pieces, all of one thickness; to-wit, $\frac{3}{8}$ inch. This enables me to dispense entirely with the diagonal wires when wiring the frames for fdn. I use, as you will see, only 6 vertical wires, No. 30, for wiring fdn. by hand. I have also used five, seven, and eight such wires, but find six to be just about the right number for frames as shallow as mine. For the Given press I should use eight vertical wires of No. 36.

BALDRIDGE'S REVERSIBLE FRAME.

I prefer, also, fine wire-nail loops for the wires in place of the holes bored or punched through the top and bottom pieces of the frame; nails $\frac{3}{4}$ inch long, and of No. 20 wire, are about the best I have tried for wood $\frac{3}{8}$ inch thick. Those with flat heads, or moulding-nails with pin heads, will answer. You will see both kinds in the frame sent you. You will

notice that I begin at one corner of the frame to wire the nail loops, and do not stop till I reach the opposite corner. I have no trouble to wire thus right from the spool; but the better way, perhaps, is to cut the wires first the proper length needed. You will also see that the loops are bent in pairs, in opposite directions, so as to guard against the possibility of the wires slipping or getting off. You will find it pretty difficult to slip the wires off the loops, as arranged; but turn them half way round, the right way, and then you can slip them off quite readily; but the other way will tighten them. I find that I can wire the frames with less trouble, and more rapidly by this plan, than through holes in the wood. This plan gets rid of all kinds in wiring; and if the wire breaks at any point it can be readily repaired without a particle of additional wire, which is not the case when wired through holes in the wood. The wire nails for the wires may be, and perhaps should be, driven, and the loops made, while the frame itself is being nailed, and before it has been taken from the form. I suggest this to save extra handling of the frames. I prefer to nail my frames, when reversible, with eight one-inch wire nails with flat heads, using two nails at each corner.

The frame sent you, as you will be sure to see, is provided with my single-wire reversible devices (not patented), which enable me or you or any one to reverse the same at will, and without the loss of any time worth mentioning. I have attached to this frame two plans of making the reversible device. One of the plans requires considerable accuracy, when wanted for frames of special depth, outside measure. The other plan, as you will see, does not require so great accuracy, and may be used for frames of any depth. Some might prefer one plan, and some the other. Either plan has advantages over the other. The wire loop, or projection, for resting on the rabbets (and these may be wood or metal, as desired), needs be only as long as the width ($\frac{1}{2}$ in.) of the top or bottom piece of the frame; or it may be long enough, as per samples, to space the frames at top or bottom or both, the right distance apart, which should be, in my judgment, about $1\frac{1}{2}$ in. from center to center of frame. But the loops may be made of any size and shape to suit one's wishes. If made as per samples, they can not cut one's fingers in handling the frames, and, as before stated, may be used with or without metal rabbets. This reversible device dispenses (as it can not be used) with your projecting "metal corners" for frames, but not necessarily with the style you use for the bottom corners of the frames, for these you can still use at all of the corners; but it seems to me that it would be just as well to dispense with them and their cost all together, and use the reversible device instead. The cost of making all frames reversible, whether in new hives or in those already in use, by the adoption of this reversible device, need be but a trifle more, and perhaps no more, than it costs now to supply new frames with your "metal corners." I have used in the samples sent you, No. 12 coppered wire, but would prefer galvanized wire, to guard against rust. Please notice, also, that one of the plans lifts the entire frame and contents from the bottom, and this does away with all danger of pulling the frames apart, as in the past, and that the other plan simply lifts the entire weight from the blind-staples.

For those who prefer to adhere to wide frames, supplied with sections for surplus honey, this re-

versible device when attached to them will be found of considerable value. From what I have seen in the apiary, I am fully persuaded that it will be highly advantageous to reverse the surplus honey as soon, at least, as a portion of it is sealed. This will not only hasten the sealing of the lower and uncapped cells, but will also secure as well-built combs at the bottoms as at the tops of the sections.

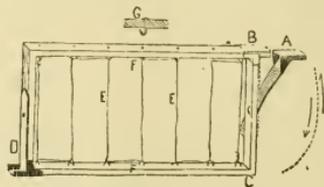

But, the above must suffice for the present. I am content to let the future demonstrate how much of the foregoing is mere theory or otherwise.

M. M. BALDRIDGE.

St. Charles, Ill., Jan. 22, 1884.

Friend B., your invention is very ingenious indeed, and it seems to me it must answer the purpose beautifully, but I should want to make a test of it in handling bees, before deciding whether I liked it or not. I do not believe I should like frames without diagonal wires, but possibly the smaller size of your frame might do very well. Our friends will notice in the engraving, that we make the wire loop square where it strikes back against the rabbet. I would have the wire bent so as to have this a sharp corner—that is, making the loop three-cornered. This would prevent the arm from killing bees so much, and it would also avoid propolis, with which they will glue it to the rabbet. I suppose the device will reverse, even when covered with gum and propolis; at least, I am satisfied it can be reversed without much trouble. Our engraver has made the width of the support C about the same as the width of the top-bar; but of course it could be made as you suggest, wide enough so that they touch each other, and thus support the frames. There would be one advantage in this: It would get a broader bearing, and thus more effectually cause the frames to hang plumb up and down. I will explain to our readers, that the modification of the device consists in cutting off the wire at the lower staple D, and bending it at right angles. By moving this staple D, we can raise the frame just as high from the bottom-boards as we choose. Wire can be purchased now quite cheaply, in straight pieces of an exact length, and all that remains is to make a machine that will turn accurately the piece C in the manner given above. D D are ordinary blind staples.

We have now tinned wire, No. 30 and 36, on spools at 3c per spool, or 28c for 10 spools. Each spool contains about $\frac{3}{4}$ ounce. Postage, 2c per spool. And now while we are on the subject of reversible frames, here is another device from another friend. I have had our engravers adapt it to the frame described above. The device will be readily understood, almost without explanation:

HOWES' REVERSIBLE FRAME.

The utility of reversible frames is no longer a

question. They have been, and are still, being used by many practical bee-men, all over the country; and I have yet to hear of any person having once tried them, who is not enthusiastic in their praise. All who have given them a thorough trial have been convinced of their great advantage.

Mr. G. W. House, in GLEANINGS for January, 1884, page 21, says: "After this season's work, I am convinced that the reversible frame will come into general use, as soon as their simplicity and easy manipulations are understood, especially so with those who keep Italians, and work for comb honey; for extracted honey they are no better than others."

While I admit, that *no more* extracted honey can be obtained by using reversible frames, still I consider them far better, especially for those who depend principally upon natural combs, or foundation not in wired frames; as, by their use, the bees are compelled to build the comb *solid*, all round the frame, instead of just fastening it to the top-bar, and only part way down the sides, leaving nearly one-half the comb entirely unfastened to the wood, thereby rendering it easily broken out, particularly if well filled with honey. If others have never been troubled from this cause, I know one who has; and I considered it such a nuisance that I determined to have *solid combs*, or quit extracting.

I first tried having the combs built in deep frames, and then cutting off the end-bars to the required depth. This was a partial remedy; but it was a great deal of trouble; it took too many *deep hives*, and it kept too many colonies comb building, exclusively, with lots of other objections easily imagined by the expert. I soon found that *reversing the frames* was a complete remedy; but how to do it; with hanging frames, was a question. Nearly all the reversible frames were Huber, or standing frames, while hanging frames made to reverse were impracticable, by being too expensive, difficult to manipulate, or both.

After repeated experiments, I at last hit upon a device which completely removes the objectionable features from the reversible hanging frame; and I offer it to the bee-keeping fraternity with full confidence of a favorable reception from all who will give it an impartial trial.

I claim for the reversible frame, as I make it, the following points of superiority; viz.:

1. The comb is *stronger* than the old style, being better fastened to the wood, and less liable to break out.
2. It neutralizes the sagging of the top-bar, thereby doing away with diagonal wires.
3. More combs can be used in the brood-chamber, when working for comb honey, giving the queen more room, which means larger colonies, with less liability to swarm.
4. It does away, to a great extent, with the bother of extracting from the brood-chamber to prevent crowding the queen.
5. It compels the bees to store all surplus in the sections, instead of the brood-chamber, thereby increasing the yield of salable honey, with correspondingly greater profits to the producer.
6. It is cheap, and may be attached to any hanging frame, by cutting off the projecting arms; and, if the bottom-bar is too weak, replacing it with a heavier, or by strengthening it by a strip slipped under, and tacked fast.
7. It is as easy to use or manipulate as the old style, and may be reversed as quickly as to return it to the hive, just as taken out.

8. It is durable; will last a lifetime, and can not get out of order.

C. J. F. HOWES.

Adrian, Mich., Feb., 1884.

If any of the friends want my opinion in regard to this matter of reversible frames, I shall have to say that I am not prepared at present to decide. I want to see them used in the apiary. Reversing sections partly filled is an idea that I gave a good many years ago in the back volumes of GLEANINGS. We had a case made to reverse. When reversed when honey was abundant, it caused some of the combs to lop down and curl over. If we had waited until the sections were nearly filled, of course we should have had no trouble.

“HOW DO THE BUSY BEE?” ETC.

HOW MANY TRIPS DO THE BEES OF A FAIR COLONY MAKE IN A SEASON?

IN the spring of 1883 I had one colony of bees which, by the first of May, were very strong, and in an excellent condition for work. They were bright Italians, being blooded stock from an imported queen. Having nothing with which to occupy my idle hours, I concluded to devote a part of the time in trying to determine the amount of labor performed by this colony of bees during the months of May, June, July, and August, in their outdoor work. In order to accomplish this task, I set apart five days in each month (or twenty days in all), commencing my labors at 5 o'clock A. M., and closing them at 7 P. M., on each of the twenty days, selecting the brightest and warmest days in which to make my observations, and using one minute in each hour in gathering the data on which to found my conclusions. The entrance to the hive was arranged in a way to enable me to count (quite accurately) the bees as they entered the hive. This counting was done by seconds of time, making, after each count, careful memoranda of the result of each minute of time used in the investigation, and at the close of my observations for the season I was able to determine, from the grand aggregate, the average number of worker bees entering the hive per second, for the daily periods below mentioned:

From 5 A. M. to 6 A. M.	one bee to the second.
“ 6 “ “ 9 “	two bees to the second.
“ 9 “ “ 4 P. M.	four “ “ “
“ 4 P. M. “ 6 “	three “ “ “
“ 6 “ “ 7 “	one and one-half “

—making the daily average of worker bees entering the hive to count 153,150, for a day of fourteen hours. For the months of May, June, July, and August, we had 50 good working days, 25 favorable, and 15 only tolerable; the average was about 75 good days as to weather, but all very poor in the secretion of nectar.

During this period of 75 days, the grand total trips made by my working bees was eleven millions four hundred and ninety-five thousand two hundred and fifty trips (11,495,250).

This colony gave me 60 lbs. of surplus honey in sections. From the published experience of those who know much about bees, I presume, from perusing their opinions as published, that it would require, for the support of a strong colony, and the rearing of brood, and building of comb, during the breeding season, about 60 lbs. of ripened or capped honey, which is a very reasonable quantity. This amount,

added to the 60 lbs. of surplus honey, makes 120 lbs. of capped, or ripened honey, deposited by my bees in the four months.

Bee-masters tell us (or, at least, some do), that the nectar gathered by the bee contains about two-thirds of watery material, which must be evaporated by the heat of the bees after it is placed in the cells, before it is ripened sufficiently for capping. If so, this 120 lbs. of capped honey would represent, by weight, 360 lbs. of nectar. Then, again, we are informed by some writers, that during the breeding season a strong colony of bees will, in addition to the honey, require about 40 lbs. of pollen and water. If so, the total amounts by weight, taken into my hive by the busy bees would amount to 2,800,000 gr. troy, or 400 lbs. av., being one-fourth of a grain troy and a fraction, per trip. If you weigh $\frac{1}{4}$ gr. troy of honey, it would appear to be enough to fill the honey-sack of the bee to an uneasy distension.

In counting bees, you must not use the tongue, and say one, two, three, but you must educate the eye so as to be able to count by your sight. My pulse is very regular in its beats of sixty to the minute; so when I took my seat I placed myself in an easy position; thereafter becoming quiet. I placed my finger on the wrist and my eye on the entrance, and the eye told the number entering the hive between each pulsation.

ANON.

St. Joseph, Mo., Jan., 1884.

CASES VERSUS WIDE FRAMES.

HOW SHALL WE GET THE MOST HONEY, WITH LEAST CAPITAL AND LABOR?

YOU are no doubt aware that Bro. Doolittle and myself work very differently in our effort to accomplish the same purpose; viz., to bring from nature the greatest amount of income, with the least capital and labor. I wish to compare our different systems of management as they appear to me. In reading Bro. Doolittle's descriptions of his management, we are impressed with the idea that he is trying to see how much surplus honey he can get from one colony, or from each colony in his apiary. This would imply that the production of a field, or area, is endless; and were this a fact, which it is not, as we well know by observing the actions of the Grimms, Hetheringtons, and Oatmans, Mr. Doolittle's system of management would rest upon a correct basis. My aim in prosecuting this business is to get the greatest possible amount of surplus from each area I occupy, with the least amount of capital and labor.

One of my objections to Mr. Doolittle's system of management, a system which, if I am correct, no large honey-producer in America is working upon at present, is the great amount of extra labor and manipulation it requires. Labor is equivalent to capital, and vice versa. I have found that I can exhaust a field of its stores much more cheaply than can be done by Mr. Doolittle's system (with which I am not without experiment), by investing a little more capital and very much less labor. My opinion is, that a hive should be so constructed and arranged that no "coaxing" nor driving of the queen is ever necessary or useful. We know what we wish to accomplish. If we can arrange our fixtures to work out the desired result automatically, we would surely do so. We can not do this, but we can somewhat approximate it, and this we think we do to a far

greater extent than Bro. Doolittle with his complicated system of almost endless manipulation. His assertion, that when only top cases are used, the bees must be crowded for room before they will enter them, is not true with our fixtures. We have never lost a drop of honey so far as my most careful observation could detect, with this case system of comb-honey production, except in times of excessive flow; and the same would be true with any system, where empty full drawn combs were not given the bees; for in such cases the field bees bring in the nectar faster than the wax-workers can make cells to hold it, even with the use of the most pliable foundation.

Such instances, however, are not common; but I deem them the greatest argument in favor of extracted vs. comb honey. If we give a prime swarm 8 standard L. frames of good fdn, we find them almost solid with brood before the surplus season ends. It will thus be seen that we suffer no loss by that proceeding. We think Bro. Doolittle's mistaken statement, above referred to, arises from the fact that he has fallen behind the times regarding the use of comb fdn., and that he was much more behind the present time, in the arrangement of his fixtures when he experimented with top storing only.

If our colonies have little strength, they gather little honey. If otherwise, with our arrangement they enter the cases, draw the foundation, and there store the honey as soon as they have any to store.

Bro. Doolittle is mistaken. We long since got rid of that hindrance, known as brood-chamber clogging, with honey. I freely admit, that with our system of management, occasionally a failing queen overlooked will hold down her colony so that the sections are not entered. What then? The brood combs are not crowded with either brood or honey, for the queen is a failure, and the workers are few. This colony does not oppose our other colonies in our field. All that is needed to make up for these occasional oversights is two or three extra colonies, and we exhaust the field all the same. We have not yet reached perfection, and our system obviates the necessity.

Losing surplus honey by the swarming of swarms is something that does not happen with our system of management.

Five or six years ago, Mr. Oatman and myself discussed long and loud this subject of storing in sections in the lower story. Last winter Mr. O. laughed at himself that he ever practiced "so ridiculous a system." At present he uses top storing only, although his hives are $\frac{1}{4}$ larger, being 2 in. deeper than the 8-frame L. which we use. Mr. Oatman's present success compares more than favorably with that in the past.

My objections to Bro. Doolittle's system are my objections to broad frames and separators, on general principles; that sections, if finished in the brood-chamber, are apt to be discolored; in either case they are apt to contain pollen, if in a location where that abounds. But the one great objection is the excessive amount of labor it involves, and we think we have found, *unnecessarily* so.

One of my brightest students of 1883 had for three years carefully read and tried to use Bro. Doolittle's system. As soon as he came to work with ours he became eloquent in its praise. The above are some of our reasons for preferring our system to Bro. Doolittle's.

Now a word regarding Bro. Miller's experience.

First, I, too, prefer tin to wood separators, after using hundreds of both. I claim that our non-separated sections are better to ship long distances than those built with separators, because the combs being about $\frac{1}{4}$ in. thicker (if the same width sections are used in both instances) have a greater breadth of attachment, according to weight of the comb, the size of the section otherwise being the same. Either kind, when crated, does not and can not touch each other as long as they do not break loose from the section.

Regarding my supers being light to handle, the ones I made Bro. Miller (to his order, and I also made a few of the same to test here), were twice as heavy as my regular super or case. Though the principle otherwise is just the same, I want no more of them. We last year used 350 one-story brood-frame supers, with 6 broad frames each, holding four $\frac{3}{4}$ sections each, and six $\frac{1}{2}$ -lb. sections each. Of course, we used narrow top-bars, and can not see why Bro. Miller should allow himself to be encumbered with tight-fitting ones. We found we could remove 100 lbs. quicker, cleaner, and with less damage, from the cases than 50 lbs. from the broad frames. Surely the doctor has not yet caught on to our method of removal. I know that is the worst feature of all, till understood, and then 'tis the best.

JAMES HEDDON.

Dowagiac, Mich., Feb. 4, 1884.

Friend H., I like your article first rate, but it seems to me you are a little rough-shod on our friend Doolittle in accusing him of being behind the times with his fixtures. My impression is, if you will allow me to put in a word here, that friend Doolittle, with his fixtures and management, would get more honey from a colony than you would; but I am also inclined to think that perhaps the extra labor his plan involves might not pay for the excess of honey. You make a good point where you contrast the difference between trying to get the largest surplus per stock, and trying to get all the honey the field produces, without much regard to the number of stocks required to do it. I presume more labor will be required to get a given amount of honey from a large number of colonies, than to get the same from a few. Modern farming aims to get as much produce from one acre as has been secured heretofore from two or more acres, and I believe that modern farming saves labor by so doing. Perhaps your plan may be pushed to too great an extreme to be profitable. By the way, I wish you and friend Miller and others, in mentioning these different cases, would tell about how many pounds of honey a certain case would be likely to average.

HOW FAR WILL BEES FLY IN SEARCH OF HONEY?

ALSO SOMETHING ABOUT HOW FAST THEY FLY.

I SEE, in the bee-papers, considerable on the above points; but as much of it appears to be guess-work, I feel like saying a few words. In my younger days I lived on the north side of Oneida Lake, in New York. The lake was 4 miles wide, at the place I speak of, and I know that the bees flew across the lake in great numbers, to gather honey out half a mile from shore. There was a small island, and one mile from shore there is another island. It was a great resort for the village folks to

go out to those islands to catch fish, and I went out there a great many times fishing; and while sitting in my boat, anchored out a few rods from the island, fishing, I saw bees flying past, some going one way and some the other. They flew from four to eight feet above the water, and sometimes one would alight on me, rest a minute, and then go on. There were 50 or 60 colonies of bees kept in and near the village, on the north side of the lake, and I believe the bees got nearly half of their honey across the lake, as the feeding-grounds were very much the best over there. Those islands had no flowers on them, and the bees did not stop there, and very likely they occupied the ground a mile or two from shore, on the south side, after they got over the lake. I have no doubt but many perished in the lake, but not so many but that bee-keeping was a fair success there, and swarms would often go across the lake.

I could give several proofs of bees going 6 miles for honey, but I want to say a few words about how fast they will fly when at work. I have hunted wild bees a good deal—so much so that I got to be an expert at the business, and by repeated tests I found they flew 30 miles an hour, or one mile in 2 minutes, in good weather, and I could tell very near by that rule how far off they were, by timing them after I had my line well started—mark a bee, note how long it took to fill up with honey, allow the same time to unload, and 2 minutes to go in and out of the hive or tree, and then divide the remainder of the minutes it was gone by 4 minutes, and I would have the distance in miles to the tree. I ran a bee-line in New York State 6 miles, and it took me a week to do it. It took a bee just 30 minutes to make a trip that distance, 6 miles. There was only one bee that would come back to my first station, or starting-place. I marked the bee, and it stayed with me until I got through the woods, 6 miles. Usually when we start a bee-line, other bees from the same colony will come back with our first ones, and help carry the honey; but I left this one all of one day, when I found it had no help.

There was an old chopping, $\frac{1}{2}$ miles on the line. I moved that one bee to that place 3 times, before it would return to the new place. Then I moved it $\frac{1}{2}$ mile. I was now 2 miles ahead on the line, and the time that my bee would be gone would average 8 minutes less than at the first position. I now left it 2 days, to increase its working force, when I found my one bee had increased to 4, and all making about the same time. I now made a move of 2 miles ahead on the line to another old clearing in the woods; and after they were fairly at work I found I had gained, on an average, 16 minutes in time for the bees to make a trip, and I was now getting plenty of bees to come back with my workers at this distance, which proved to be 2 miles. The bees could then bring others with them quite fast. The next day I worked them through to their home in a hive, in time to take supper with their owner, and we did not have honey for supper either. But I learned that in this case the bees flew one mile in 2 minutes on an average, both ways, and that my one bee could not get another bee to follow her half the whole 6 miles. At 4 miles there was a gain of only 3 bees in 2 days; and at 2 miles they gained fast, and the last mile they just swarmed into my box.

EDWIN FRANCE.

Platteville, Grant Co., Wis.

Many thanks, friend F., for your very prac-

tical article. I have hunted bees some myself, and I have worked them the way you state, although I never timed them with the view of getting distances as accurately as you did. As the bees took some time to get under way and stop in your experiments, and as they were all pretty well loaded with honey, probably, it seems quite likely that their average speed on a long flight would be toward 40 or 50 miles per hour; but I am inclined to think they do not often go much beyond this.

DRONES AND QUEENS.

POSITIVE PROOF THAT DRONES DO COLLECT IN BODIES IN SWARMING-TIME.

MY bees, near a hundred stocks, together with about fifty nuclei, stood near the house in dense shade during the past summer. About 3 o'clock in the afternoon one day in July, I left the house and started around the apiary, looking for swarms in the trees. When I got about the middle of the north side I stopped to pick and eat a few raspberries. As soon as I stood still, I could distinctly hear overhead that peculiar roar so readily heard where drones congregate in great numbers. Never before had I heard it near an apiary—generally some half-mile or more away. I continued eating, listening and meditating quite a good while. Presently the sound indicated that the drones were coming nearer and nearer, and that they were unusually excited, and very angry. This caused me to turn half around and look, whether I might not see them, they seemed so near. And, sure enough, about a rod to the northwest, there they were in a cluster, the shape of a balloon. The cluster retained its form, but moved rapidly eastward, about ten feet from the ground. I hardly know how to describe to you how agitated they seemed, and how each particular drone seemed to exert himself, and whiz and whirl as though he expected by his bluster to bluff every other drone, and every other one seemed to be trying to do the same thing, till all was a perfect medley of confusion and anger. After they had got some four or five rods from me, a few of the lower ones fell to the ground, while the greater number would disperse and become invisible, except now and then one would whiz past close to me, sounding for all the world as though he had a notion to sting. In a few minutes more, another cluster would form, and go through the same performance, and disperse as before.

I then walked out into a clover patch, and called my son to witness what I thought to be a rare scene. I was amused to see him dodge, as I had felt like doing, when one of those angry drones would come near his head. It was hard to believe they would not sting. We both saw the same phenomenon repeated several times in a few minutes. Finally, as we were looking toward the sun, with a piece of timber for a background, we saw a few drones fall from a cluster, and now and then one flying past where they fell. When we went to the spot we found one *live* drone on a stalk of red clover, and in the same bunch a queen, evidently a virgin, and with her five worker-bees. She was brushing herself with her legs as if preparing for flight, while the workers were carefully watching her with an appearance of anxiety, I sent for a cage, put the

queen in, sent her to the house, directing that she be fed, intending to clip her and introduce her to hatching brood. Just then I was called away; and when I returned at evening, I forgot all about my queen. Next morning she was dead. I was sorry. I felt as though I had neglected a rare chance to prove that she had been fertilized. I wish I could have the opportunity again! J. S. HUGHES.

Mt. Zion, Ill., Feb. 14, 1884.

Friend II., you have given us another link in the chain of evidence, showing that drones congregate in such bodies during the afternoon of every pleasant day in the proper season. When a young queen goes out, she by instinct seeks this great body of drones, and is soon fertilized, and returns to her hive. If she does not find this body of drones, she perhaps makes another trip some other day, and so on. I have often heard them in the air, and have tried to see them, but they always seemed too high up for sight.

BASSWOOD.

DOOLITTLE TALKS TO US ABOUT IT.

ON page 44 of GLEANINGS for Jan. 15, 1884, I see friends Stehle and Knowles are thinking of moving their bees to where there is plenty of basswood timber, after the clover-bloom has gone, or is about to fail. The plan is a good one, and I can see nothing against it, except the expense. I believe basswood to be the greatest honey-producer of the world. In fact, no report has ever been given (if I am correct) of an average yield of 20 lbs. per day from a single colony for 30 days in succession, except from basswood. Gallup had a colony do this. I had one which gave that for about 10 days, the best yield being 66 lbs. in 3 days. Now, if the above friends can move their bees to the basswood, and return them at an expense of \$1.00 per colony, it will be seen that 10 lbs. of extracted honey from each colony will pay the cost, if they should get that much surplus; and if the cost should even come up to \$2.00 each, 20 lbs. would make it good.

By going back over my account with my bees for the past 12 years, I find that from basswood alone my yield of *comb* honey has not been far from 70 lbs. on an average, from each colony, each year, the lightest yield being about 45 lbs., and the heaviest 120 lbs. This is the average yield of the yard, not the yield of individual colonies. Now, if we call 70 lbs. of comb honey what we can expect one year with another from basswood, and allow that $\frac{1}{2}$ more in lbs. can be obtained where we work for extracted honey, we shall have 105 lbs. as an average yield of extracted honey. If we allow 20 lbs. of this as the cost of moving our bees to the basswood, we shall have 85 lbs. left, or \$8.50 per colony, calling the honey worth 10 cents per lb. So if 100 colonies are moved, we have \$850 free of all expense for our undertaking. But we will suppose the year we move to the basswood to be one of the poor years, and only 45 lbs. of comb honey is obtained. This would give 67 lbs. of extracted honey, or 47 lbs. after paying for moving, equaling \$470 for 100 colonies. Hence I should consider it a very safe investment to move my bees to a basswood region, if I lived where there was none.

On page 44 I notice these words: "If I am correct, the basswood-trees form the buds and leaflets 3 or 4 weeks before they open and secrete honey, which

should enable us to ascertain in time to move, or not." The fruit-buds and leaflets to all trees with which I am familiar are formed in June and July of the preceding year, so the results of next season's honey-yield, as far as buds and flowers are concerned, are already formed in embryo, on the apparently bare and lifeless branches of the basswood-trees, as we behold them these zero days of winter. They wait only for the warmth of spring, to bring this dormant life into growth. As soon as these buds unfold, the latter part of May, then we can see and know, as Mr. Stehle says, whether to "move or not." By examining closely we can find the bunch of buds at the base of each leaf, curled up, looking like the half of a very small pea, or perhaps a little fuzzy caterpillar would explain it better. With each week this bunch of buds grows, till at the end of the 7 weeks from the time the trees put on their green in the spring, they open their flowers, filled with nectar to invite the bees to a sumptuous feast. Of course, a cool season will retard the time of blossoming a little, and a hot season advance it; but the above is the rule. Thus the practiced eye can tell nearly two months in advance, as to the promise of a yield of basswood honey.

I now come to friend Root's question, asked on page 81 of Feb. GLEANINGS, where he says, "Perhaps friend Doolittle can tell us if they ever have seasons where basswood is the thickest, when it yields absolutely no honey." I have never known such a season. The shortest yield I ever knew gave a 3-days' yield, in which honey was so plentiful that the bees could not prepare room fast enough to store it, with a gradual tapering off of two days more, making 5 days in all. The longest season I ever knew was the one just passed, which gave a good yield for 20 days, with 3 days in the center so cold the bees could do nothing, and two days tapering off, making 25 days in all.

The state of the atmosphere has very much to do with the secretion of honey in the basswood-flower. The most unfavorable weather is a cold, rainy, cloudy spell, with the wind in the northwest. If basswood came at a time of year when we were liable to have much such weather, there might be such a thing as an entire failure of honey from it. But as a rule we have but little such weather at this season of the year. The condition most favorable to a large yield is when the weather is very warm, and the air filled with electricity. At times when showers pass all around, with sharp lightning and heavy thunder, the honey will almost drop from the blossoms, providing no rain chances to come within a mile or two of us. At such times as this I have seen honey in the blossoms after they had fallen off on the ground, so that it sparkled in the morning sunshine. Then this nectar is honey, and not sweetened water, which makes basswood doubly valuable over most of the other honey-secreting plants and trees. One bee-load of nectar from the basswood, in a dry warm time, is equal to 5 from the teal, or 3 from white clover. In a rainy time there is not so great a difference. At times when basswood was yielding its best, I have seen more than a bee-load of honey in a single flower. Each little flower has 5 concave or convex outside leaves, on the inside of which, near the base, the honey is secreted. By holding these up so the sun will shine into them, you can see the honey, or see where it is, by looking through from the back side. At times when all is favorable, the drop of honey in each of these cups will be as large as medium-sized

shot, while when not favorable they can scarcely be seen. I have taken one stem of blossoms, when the yield was great, and passed it over my hand, when I would have several drops of nice thick honey in my hand. One peculiarity I have often noticed is, that at such times not more than half of the trees would be visited by the bees. There are two quite large trees standing about 5 rods apart, in an open field, not far from my apiary, which are both visited by the bees in times when but little honey is secreted; but when the secretion is profuse, one tree only will be visited by the bees, while, as far as I can see, both yield honey alike. So I have often noticed along the edge of the woods, trees all sparkling with honey, with not a bee near them, while others will resound with the merry hum of the bees. Why this is, I do not know, unless they get started at work on a certain tree, and finding all the honey they can take, and more too, keep going to the same spot. At such times as this, 1000 colonies of bees could find all the honey they could carry, if all were left at one place; but at all other times, I think from 100 to 200 would be ample for any locality.

In conclusion I would say, that, were it not for basswood, I do not believe there would be honey enough in this locality to make it pay to keep bees, unless it were a few so as to get a little honey for family use. G. M. DOOLITTLE.

Borodino, N. Y., Feb. 16, 1884.

Friend D., I am prepared to indorse every word you say in regard to basswood, unless it is to ask if you have not made a mistake in saying that Gallup had a colony that gave 20 lbs. per day for 30 days in succession. It may be so, and that I have forgotten it; but it seems almost incredible. That is 600 lbs. from a single colony in one season, and I can not remember that I ever knew 30 good honey days in succession in all my experience in bee-keeping. I wonder if friend Gallup was not a little excited when he made the statement. I am very glad indeed to get such an article from you at just this crisis; for if bee-keepers don't go to planting basswood forests, and that, too, right quick, their occupation, like Othello's, will soon be gone, or, at least, a great part of it. Your article has stirred me up to the importance of putting out 50,000 or 100,000 little trees on our honey-farm. Of course, these will be used to fill orders, rather than to let them grow up for honey. I, too, have seen honey sparkling from the blossoms, and the sight of it in our young basswood orchard, at its present stage of growth, is enough to make anybody enthusiastic, even if he is not more than half a bee-keeper. Remember, dear friends, however, that it is an expensive undertaking, and one has got to wait many long years for a crop. Our basswood orchard was planted 12 years ago this spring, and not more than half the trees are yet in bearing; but they were put on a rather poor piece of land, and were set too far apart. I would have them not to exceed 12 feet each way; and when the trees get to be crowded, take out every other one. If they are small, half that distance might do, for the ground must be pretty well shaded to get the best results. The sun hurts them. The way they grow in a dense thicket in woodland where no stock is permitted, tells us pretty plainly what kind of treatment they need.

WHAT SHALL WE PUT OUR HONEY IN?

PAILS, BARRELS, TIN CANS, ETC.

SOME one has said, that the package for holding honey ought not to exceed one cent per pound, either in large lots or small; and a good many have decided that they do not want it in barrels at all, although barrels are probably the cheapest package that we can have, and the railroad companies will carry honey in barrels cheaper than in any other shape. The iron-jacket cans have answered beautifully for shipping honey. We have received and sent off several tons in them, and have had no leakage and no breakage, and the honey is as pure and sweet as the day it was taken from the hive. I am very much inclined to think that barrels are very apt to give a slight taste of the wood. Well, the iron-jacket can costs \$1.10 for the 10-gallon size, while the can we show in the figure below,

THE WOOD-ENCASED SHIPPING HONEY-PAIL.

10-gallon size, costs only an even dollar, and in quantities of ten, only 90 cts. each. This can, however, is not protected by iron, but by wood, and as it is a rather pretty pail, quite handy for many purposes, it may prove a favorite. It has a large-sized nozzle, so that thick honey may be poured out rapidly. I do not see why they do not put a screw cap over it. This reminds me that we have shipped some large amounts of honey in the screw-cap cans, and have never had a report of leakage; so it seems to us, the improved Jones honey-pails, with the screw cap, are going to be the thing. We can put a large-sized screw cap on either the iron jacket or the above style of cans for 10 cts. extra.

LETTER FROM W. F. CLARKE.

FRIEND ROOT:—I was quite disappointed that I did not get more talk with you at the Toronto Convention, but it was a very hurried time. "There were many coming and going, and there was no leisure, so much as to eat." Most of my life has been that way, but I have now settled down as a quiet "country parson," and begin to realize what Miss Havergal describes in the inclosed lines, which are good enough to publish in GLEANINGS, or anywhere else, for that matter,

Boes? Yes, of course I must keep some. Though the "pesky critters" (I can't call them "little pets," they won't let me) sting me unmercifully, and the stings swell, and the virus goes to my head, I can't let them altogether alone. W. M. F. CLARKE. Speedside, Ont., Can., Jan. 24, 1884.

A LULL IN LIFE.—MARK 6:31.

[Affectionately commended to Bro. Root, who needs "a lull in life" about as badly as any man I know.]

Oh for a desert place with only the Master's smile!
Oh for the "coming apart" with only his "rest awhile"!
Many are "coming and going" with busily and restless feet,
And the soul is hungering now, with "no leisure so much as to eat."

Dear is my wealth of love from many and valued friends,
Best of the earthly gifts that a bounteous Father sends:
Pleasant the counsel sweet, and the interchange of thought,
Welcome the twilight hour with musical brightness fraught.

Dear is the work he gives in many a varied way,
Little enough in itself, but something to every day,
Something by pen for the distant, by hand or voice for the near,
Whether to soothe or teach, whether to aid or cheer.

Not that I lightly prize the treasure of valued friends,
Not that I turn aside from the work the Master sends,
Yet I have longed for a pause in the rush and whirl of time,
Longed for silence to fall instead of its merriest chime.

Longed for a hush to group the harmonies of thought,
Round each melodious strain that the harp of life hath caught,
And time for the fitful breeze Eolian chords to bring,
Waking the music that slept, mute in the tensionless string.

Longed for a calm to let the circles die away
That tremble over the heart, breaking the heavenly ray,
And to leave its wavering mirror true to the star above,
Brightened and stilled to its depths with the quiet of "perfect love."

Longed for a sabbath of life, a time of renewing of youth,
For a full-orbed leisure to shine on the fountains of holy truth,
And to fill my chalice anew with its waters fresh and sweet,
While resting in silent love at the Master's glorious feet.

There are songs that can only flow in the loveliest shades of night,
There are flowers that can not grow in a blaze of tropical light;
There are crystals that can not form till the vessel be cooled
Crystal and flower and song, given as God hath willed.

There is work that can not be done in the swell of a hurrying tide,
But my hand is not on the helm to turn the bark aside,
Yet I cast a longing eye on the hidden and waveless pool,
Under the shadowing rock, currentless, clear, and cool.

Well, I will wait in the crowd till he shall call me apart,
"Till the silence fall which shall waken the music of mind and heart,
Patiently wait till he give me the work of my choice,
Blending the song of life with the thrill of the Master's voice.

FRANCES RIDLEY HAVERGAL.

SOME ITEMS FROM DR. MILLER.

VENTILATION OF CELLAR.

HERETOFORE I packed my bees in the cellar, with the hives piled up solid, like so many bricks. Of course, I could get at the outside ones only, and they received very little attention the winter through, having only the doors and window open on warm nights. A sub-ventilation pipe of 4-inch bore runs under ground a distance of, 100 feet, and enters the bottom of the cellar, thus supplying ventilation when the weather is cold. Some may not know that this pipe under ground does not supply ventilation at all times alike. Suppose a warm spell comes, and the temperature outside is about the same as in the cellar, ventilation ceases, and I have known times when the temperature outside was warmer than that of the cellar, when the flame of a lighted match showed the current of air actually to be flowing out of the pipe, instead of in. At such times I open the window and doors in the evening, and close them next day, sometimes in the morning, sometimes not till noon, for I find if they are well supplied with fresh air the matter of darkness is not essential. Perhaps, however, if they were too warm

they would not stand the light. I think if my sub-ventilation pipe were 200 feet in length, and 6 inches in diameter it would be better. Jan. 5 the mercury outside went down to 37° below zero. The next day the air came into the cellar, through the pipe, at 37 above zero, and that is the lowest it has been this winter. If I did not put a fire in the cellar, I think the temperature of the cellar would be all the time, during cold weather, nearly the same as that of the air coming in through the pipe.

But I intended, when I commenced, to tell how I was differing this winter in taking care of my bees.

CLEANING OUT DEAD BEES IN WINTER.

Last spring, on taking the bees out of the cellar, the entrances of many of the hives were badly choked up with dead bees; some of them so badly that not a single bee could get out. I thought it might be a good plan to try to avoid this in future; so last fall, when the bees were put in the cellar, two rows of hives were placed back to back (they were piled 5 high), then an alley-way left, then another two rows back to back, and so on. This leaves it so that I can get at the entrance of each hive in the cellar. I have twice already cleaned out the dead bees from the entrance of each hive, and for several inches back in the hive where possible; for in many of them the cluster of live bees extends down to the bottom-board, and in some of them clear out to the entrance. There is a great difference in the number of dead bees in different hives. In some of them, during the first two months of their imprisonment, I have found two or three pints of dead bees; in others, not as many tablespoonfuls. I also sweep up the alley-ways, and I can not help but think the bees will be the better off to be free from the smell of so many decaying bodies of their dead companions.

FIRE IN BEE-CELLAR.

For several years I have had a stove in the cellar, and have occasionally put a slow fire in it when the cellar appeared damp or very cold. Formerly when I put in a fire, a great hubbub was raised among the bees, which subsided after a time, and then they were quieter than before the fire was put in. If I put in a fire in the evening, and raised the temperature a few degrees, in the morning I found the bees all quiet, and at first attributed it to their being warmer; but the thermometer would show the same temperature in the morning as before the fire was put in, so they could not be quieter because warmer. Was it because the fire had increased the ventilation, and given them purer air, or did they take the chance while it was warmer to turn over in bed and settle down more comfortably? Much the same thing occurred if I opened window and doors on warm nights in spring. The bees made such a roaring that at first I was quite alarmed, for fear many were leaving their hives; but in the morning all was very quiet; and if the bright rays of the sun shone directly into the cellar, and on the hives, not a bee stirred. This winter I kept the cellar open nearly every night, and sometimes days, until the very cold weather came in the middle of December, and there was no excitement noticeable among the bees on opening the cellar. Since the cold weather I have put in fire nearly every day, and it is so dry that the ground of the floor is dusty on being swept. On putting in fire now, the bees pay no attention to it, although a thermometer laid on a hive nearest the stove shows a rise of 15 degrees. The noticeable feature in the case is, that whereas in former years the admission

of fresh air, or heating by a fire, roused up the bees, this winter it has no such effect. I do not know of any thing to make the difference, unless it be that the air is never allowed to become foul this winter, no disagreeable odor ever being present on entering the cellar. At present 201 colonies are in this cellar, the remaining 50 being in a new cellar, which is damp and not so well ventilated.

DR. C. C. MILLER, 172-251.

Marengo, McHenry Co., Ill., Feb. 12, 1884.

OBSERVATIONS

ABOUT BASSWOOD BARRELS AND HYBRID HONEY.

AS I have not bothered you for almost two years, I thought I would give you a "brief" of my observation during that time.

BASSWOOD BARRELS.

I have observed that we have something better in the line of packages for extracted honey than you advise in A B C. It is a neat basswood keg (or barrel, as you choose); it needs no waxing, and will hold *every time*. I first saw it in use to hold sorghum syrup. Its merits are simply these: Neat, light, tight, and sweet; no one will deny but that the acid in oak packages imparts a flavor that more or less damages extracted honey. It is also cheap. I had one hundred 32-gallon barrels offered me for \$100. I know you will object to it on the ground that it will use up all the basswood timber; but if you could see this *basswood country* you would think it would be a while before it would be gone; and I tell you, a few thousand pounds of pure basswood honey put up in nice white basswood kegs that *won't leak a drop* is pleasant to the sight.

EXTRACTED HONEY.

I have observed that extracted honey has made great strides in the past two years toward the tables of the working class; and 'tis here it must find its way, and in competition with all the cheap articles of food, before honey will become a staple article. A cheap but pure article of extracted honey need never interfere with the production of fancy comb honey any more than all the cheap articles of food and clothing interfere with the more fancy articles. There will always be a demand for both.

ADVANTAGE OF EXPERIENCE.

I have observed that profitable bee-keeping is born of study and experience; for six years ago I could not make bees pay in a good season, while this season I have made 43 colonies produce 5000 lbs. of honey, and it is conceded by all to have been a poor season; but I am well satisfied with the result.

HYBRIDS AND HONEY.

I have hesitated some about writing this observation, for fear it might be one of those truths that should not be told, and I can see the slowly passing finger of scorn pointed at me by hundreds of our fancy breeders for saying it, that the best general-purpose bee is the hybrid. If I could have my bees what I wish, I would say, increase their tendency to longevity; increase their energy, and give greater wing power; and if the hybrid (produced close up to the importation) of the Italian queen by drones of the German brown bee does not have these qualities, then I don't believe you can find them.

I had ten of these queens this season that gave me 2200 lbs. of honey; the one on the scales gave 268 lbs. of surplus; on the 22d of July they gathered 18 lbs. of basswood honey after 2 P. M. I had 33 colonies of

blacks and Italians in the same apiary that gave only 2800 lbs. of surplus. The hybrids in question seemed to live nearly all summer, and their colonies became immense. The queens, of course, were no more prolific than my other Italians; but I believe it is a fact, these American-Italians have greater wing power to bear their load against the wind than either race in its purity.

I have been forced to these conclusions, for no man ever thought more of his gentle bees with their golden rings than I; but I have found out that those pestiferous hybrids wear only one and two rings; but they are 15 karat fine. I wish 'twere not so, for I do not like them; but while they fill my barrels with honey and my pockets with money, I will put up with their dirty complexions and dyspeptic dispositions. I have at present 120 colonies under my control, 80 of which are my own. They have wintered thus far without the loss of one, and are in fine condition, all in cellars.

A GOOD CELLAR FOR WISCONSIN.

I was going to close, but will supplement another observation, and that is, that a well-arranged cellar "gets away" with any other system of wintering, anywhere on the 45th parallel. M. A. GILL.

Viola, Rich. Co., Wis., Feb., 1884.

HALF-HEARTEDNESS, ETC.

IS IT ONLY GOOD PEOPLE WHO ARE WHOLE-HEARTED?

FRIEND ROOT:—Some people have a queer way of thinking over things that they see in print, and have to ventilate once in a while. "That is I." I have thought about that piece which you call "Half-heartedness," and as I have noticed lots of people that way, and some of them good people too, and other people just the reverse, and some of them you would call very wicked, I have come to the conclusion that the organs of "order" were omitted in their make-up to a very large extent, and they need to go through a course of training to give strength to that faculty, and it makes very little difference with many whether they are converted or not, as it does not change their organization.

Friend J., you are right about the matter of half-heartedness. There are half-hearted good people, and half-hearted bad people, as well as the reverse. Energy does not always belong to godliness, although godliness should give us energy. I have often mused, and mused sadly, too, on this fact that you so clearly bring out. You say that conversion does not change a man's organization, but that he needs to go through a course of training to strengthen that faculty. You are correct there too; but when you say that it makes little difference whether they are converted or not, I should want to put in a word.

Conversion ought to be a starting-point of the training you have just alluded to. If a man should say before his friends, that he had given the matter much thought and study, and had deliberately decided that he would not have a weedy garden any longer, he might be likened to a man who is at the point of conversion. He has decided to make a change of purpose, or has made a change of purpose. Now, if this change is not lasting, it does not amount to much. If he does

not roll up his sleeves and pitch right into that garden, and stick to it, his friends would be very likely to decide there was no change in the man—nothing but talk. A man may change his purpose in a minute; but to change *himself* is a matter that takes long weary months and years.

WHAT CONSTITUTES A FRAUD?

Another thing on my mind is the reference to Mrs. Cotton, as charging more for her fixtures than what you call regular dealers, and that she has a patent on them. Now, people need not buy if they do not like her prices; and about patents, I notice you tell us that the publishers of the "Story of the Bible" oblige you to sell the book for more than what you had deemed a fair profit, and I can not see any more harm in a patent bee-hive than a patent Bible, and some have expressed themselves as well pleased with her goods. DANIEL H. JOHNSON.

Danielsonville, Co., Feb. 11, 1884.

You say that people need not buy things at high prices, if they do not want to. Suppose a man should get some eggs at your country store, and recommend them so highly, as being the product of a new breed of fowls, that he sells them all over the neighborhood for a dollar apiece. You might claim that people need not buy, if they don't like the price, and it is true too; but for all that, what does the world generally think of men who do such things? I believe they call them frauds. Mrs. Cotton gets \$3.00, as I have explained on another page, for what is printed on one single sheet of paper, or a leaf of paper, if you choose. She gets it because she claims to have something new in the way of bee-hives, and vastly superior to any thing in common use; whereas all intelligent bee-keepers admit, that her special method is not new, nor unknown. Is it right or is it wrong for her to take people's money in this way? If the price she charges for this leaflet were 10 or even 25 cents, probably no one would complain, even if he found that hives made in the same way were described in books on bee culture. The point in question, you see, is the price she charges, and the amount of information she gives. Some little time ago, friend Alley claimed to have a valuable secret in regard to rearing queens. There was talk of having it patented, and selling the process for a dollar or such a matter. I urged vehemently that he put it in the form of a book, and add enough other matter to it to make a fair-sized book, such as is usually sold for a dollar. He has done so, and nobody complains who buys the book. I think, too, he is making a good deal more money than he would have done had he charged \$1.00 for the contents of a leaf or two, or perhaps for a little pamphlet. In our November number, friend Fletcher wrote pretty vehemently in regard to selling recipes for preserving eggs. In the December number of the *Bee-keepers' Magazine*, friend Quinby, of White Plains, N. Y., takes GLEANINGS to task for what is said there, and declares that he can preserve eggs six months so that it would be hard to tell the difference between them and eggs a week old. Now, with such authority as friend Quinby, we shall have to conclude that eggs may be preserved, and that profitably, with a reason-

able degree of freshness. He adds, that the process is not and never has been for sale. We shall have to conclude, then, one of two things: That he is going to give the process to the public, or else withhold it. If it is valuable, what would be the proper thing to do with it? What would mankind in general deem a fair way of disposing of such a recipe, if the owner wanted to dispose of it? If it could all be printed on a single leaf of a book, it seems to me it ought to be sold for something like 10 or 25 cents, but the latter price usually pays for a pretty fair little book, on almost any of our industries. If that would not pay the owner of the secret for spending his time with it, I would suggest he write a nice little book on the care of eggs, and perhaps something about poultry-breeding; and if the secret were a valuable one, the book would probably have a large sale, and we all know that a good book is a good thing to have.

You might say that I am dictating in this matter. Well, the matter has been pretty well discussed, and most people have made up their minds in regard to selling recipes. Did you ever pay a dollar or five dollars for something printed on a single bit of paper, say the size of a common book-leaf? If so, how did it turn out, and what do you think of the man who sold it to you? Is valuable information sold in that way on any subject whatever? or is it in accordance with the spirit of this day and age, when knowledge on any subject is so freely given and as freely received? Now just a word about the Story of the Bible:

I have never meant to dictate what people ought to charge for their own property; in fact, I believe I have always stopped selling any thing at a low price when I found the manufacturer objected to my so doing. I have protested against selling recipes, or charging great prices for a small amount of information, in the way I have told you above. But in these cases the prices were so extravagant, it seemed to me they approached nearly to the character of a fraud, if not quite a fraud. The Story of the Bible is a book of 700 pages and 274 illustrations, and would ordinarily be considered very low at a dollar. The publisher gave me a very low rate to jobbers, because I used so many of them. But he felt hurt when he found I was selling them at 75 cents singly. He did not say I should not sell them so, but he said he should be very sorry to have me continue doing it, and gave good reasons. Is the case parallel with that of Mrs. Cotton's? It is true, quite a good many have expressed themselves as pleased with Mrs. Cotton's method of management, and I have taken pains to publish every such expression I could find, just as I have been pleased to publish reports from those who had tried Doolittle's method, or friend Heddon's method, with lots of others. Doolittle sells a little pamphlet, telling how his hives are made and used, for 10 cents, if I am correct. In Mrs. Cotton's case, you pay \$1.00 for a rather small-sized book, and \$5.00 for a sample hive, or \$3.00 for directions for making it. Perhaps I should add, that I am not posted in the matter of preserving eggs, and am

glad to be corrected when I make mistakes; but I am pretty well posted in the matter of buying recipes, for I have tried buying them with the view of getting something valuable for GLEANINGS; and ever since the time when I was a boy, when I gave my watch, and all the money I could scrape up, for a recipe for making a wonderful burning-fluid, up to the present day, I have never seen a recipe so sold, of any value; in fact, the more dollars I have paid for a recipe, the more worthless it proved on trial.

At one of our bee conventions, it was said a man had a secret for curing foul brood; that he would do it for \$5.00 or such a matter, but wouldn't tell it to anybody. Dr. C. C. Miller and Prof. Cook both declared that their invariable experience had been in horticulture and other industries that men who made such claims were ignorant or bad, and that no valuable information ever came to light in that shape. This seemed to be the sense of the convention; and, dear friends, is it not the sense of this enlightened age of the world.

The "Smilarity."

THE Florida Dispatch is guilty of the following:—

WHY PEOPLE SHOULD EAT HONEY.

Thousands and tens of thousands of children are dying all around us, who, because their ever-developing nature demands sweetness, crave and eagerly demolish the adulterated "candies" and "syrup" of modern times. If these could be fed on honey instead, they would develop and grow up into healthy men and women.

Children would rather eat bread and honey than bread and butter; one pound of honey will reach as far as two pounds of butter, and has, besides, the advantage of being far more healthful and pleasant-tasted, and always remains good, while butter soon becomes rancid, and often produces cramp in the stomach, eruptions, sourness, vomiting, and diarrhoea. Pure honey should always be freely used in every family. Honey eaten upon wheat bread is very beneficial to health.

The use of honey instead of sugar for almost every kind of cooking is as pleasant for the palate as it is healthful for the stomach. In preparing blackberry, raspberry, or strawberry shortcake, it is infinitely superior.

It is a common expression, that honey is a luxury, having nothing to do with the life-giving principle. This is an error—honey is food in one of its most concentrated forms. True, it does not add so much to the growth of muscles as does beefsteak, but it does impart other properties no less necessary to health, and vigorous physical and intellectual action. It gives warmth to the system, arouses nervous energy, and gives vigor to all the vital functions. To the laborer it gives strength—to the business man mental force. Its effects are not like ordinary stimulants, such as spirits, etc., but it produces a healthy action, the results of which are pleasing and permanent—a sweet disposition and a bright intellect.

If it is not all true, it is a good deal true; and besides, it is very pleasant reading for bee-keepers. If the last paragraph does not provoke a smile on your face, I am inclined to think that you do not smile very often. By the way, I want to add that honey is food for me, and a pretty good kind of food also; especially when good bread and butter are alongside, and a good-sized pitcher of milk and a large goblet in immediate proximity.

Heads of Grain, From Different Fields.

SHALL WE TAKE THEM OUT OF THE CELLAR, AND PUT THEM BACK AGAIN?

I HERE send my report for 1883. Started in the spring with 15 colonies; increased to 35, and got 937 lbs. extracted, and 286 lbs. box honey (in sections). I sold my honey at 20 cts. per box, and 12½ cts. per lb. for extracted; that is what I retailed it at; to the stores, 15 to 17 cts. for boxes, and 10 for extracted. I sold honey to the amount of \$123, and have about 100 lbs. to sell. Besides this, we used about 275 lbs. in a year. I wintered my bees in the cellar last winter; put them in Nov. 15, 1882, and set them out on the 5th of April, 1883. I lost 4 in wintering; three had the dysentery. All were bad. I think if I had carried them out and let them fly in February or the first of March, I might have saved them all. When I set them out in the spring, the first day flying cured them all of dysentery, and I had no dwindling. I carried my bees all into the cellar November 12, and they are all right yet. A few had a little dysentery. Do you think it best to give them a flight, when it gets warm enough, and carry them back into the cellar, or set them in until I can leave them out? DAVID K. KNOLL.

Salamanca, Ind., Feb. 14, 1884.

Friend K., this is one of the unsettled questions. I presume they would sometimes be better if left out, and sometimes better if left in. The trouble is, to guess what the weather will be. If you could get them out so as to have them have a thorough cleansing flight when the weather is warm, and no high winds, and then put them back until the cold storms and blustering windy days were past, it would probably be an advantage. But it is so hard to hit it just right, I believe most of the friends keep them in as long as they can, and not have them suffer, and when they are put out, leave them there.

HOW MUCH MONEY CAN A MAN MAKE WITH TEN COLONIES?

How much comb honey, or extracted either, can a bee-keeper expect (except one young swarm each year) from one good strong colony in a 10-frame Langstroth hive, one year with another, on an average, for five years, where there is an abundance of white clover and basswood bloom? Second: Can nucleus swarms be formed from young swarms after they have their hives filled with brood and honey, without injuring them? Third: Will it do to hive young swarms on combs where bees have died from dysentery? C. W. VANHOUTEN.

Smithfield, Ill., Feb. 1, 1884.

An inexperienced contemplator I am, and wish to have your advice on going into the bee business. If I am successful, what will be my profit on ten colonies of bees the first year, the second, and third? Can I make it a profitable business by following your instructions? I have 7 colonies of bees, and can get some more. J. H. TITUS.

Adams, Pa., Jan. 31, 1884.

I have had numbers of letters like the above, and those who accuse us of giving only the bright side of bee culture would perhaps expect me to give an encouraging reply.

Now, friend T., without knowing any thing about you or your surroundings, I could not even guess what you would make with ten colonies. You may lose \$50.00 in a single season, besides wasting your time; and then, again, you might do nicely. Bees are very uncertain property. I might, for an illustration say, "How much money would a man be likely to make from an acre of strawberries?" But the strawberries would probably be more sure of giving some kind of return than the bees would. I really do not know how I could make any kind of an answer; but I could tell you this: That you might look over the reports from those who started with a similar number, and see what they did. But even then you would perhaps find reports only from the successful ones. Such questions can not be answered, as I see it. Great numbers *have* made a success of it by the instructions in the A B C.

SHALL FARMERS KEEP BEES?

The farmer can, with a few colonies of bees, raise enough honey to supply his own family, and have a surplus to sell, which will more than pay the expenses of his apiary. Farmers, as a rule, do not buy honey; they either raise it or do without—at least, this is the case in my neighborhood.

There is also another feature in bee culture which should by no means be overlooked; that is, the amount of knowledge one may obtain by carefully studying the natural history of the honey-bee, which will tend to elevate our thoughts to the Creator of all things, and make us exclaim, "Why was such a small insect made, with such a mysterious nature?"

As I keep bees in a small way in connection with farming, I will give you an outline of what I have done since 1877:

1877.		1880.	
Total receipts.....	\$15 85	Total receipts.....	\$54 25
" expenses.....	5 70	" Expenses.....	12 40
Net.....	\$10 15	Net.....	\$41 85
1878.		1881.	
Receipts.....	\$23 45	Receipts.....	\$40 40
Expensrs.....	2 95	Expenses.....	11 25
Net.....	\$20 50	Net.....	\$29 15
1879.		1882.	
Receipts.....	\$24 50	Receipts.....	\$81 60
Expenses.....	7 35	Expenses.....	17 40
Net.....	\$17 15	Net.....	\$64 20

In 1882 my net profit was \$60.90. This does not include what honey was consumed by a large family.

A. T. MCLLWAIN.

Abbeville C. H., S. C., Feb. 13, 1884.

FLORIDA; HOW OUR FRIEND ILLA MICHENER LIKES IT.

I have just returned from a visit to Florida. I found the State just about as represented—a great deal of wet land, and a large amount of beautiful high, dry, rolling land, suitable for orange-growing. The climate is delightful. All the time we were there it was like one continued Indian-summer day, the most beautiful you ever saw. Orange culture is very profitable. But take away the orange and the glorious climate, and there would not be left any thing very delightful in Florida. I look with me a 4-frame nucleus for experiment. I released them at Brooksville, Hernando Co., and that same day they were gathering pollen. But I can not see where they are going to gather any large amount of honey. The friend I left them with will report.

ILLA MICHENER.

Low Banks, Ont., Can., Feb. 11, 1884.

A WORD IN FAVOR OF SEPARATORS.

I can't see that tin separators hinder, for last season I filled their hives, the hives of eight swarms, with comb, and left them there till fall. They did not fill every comb, for they had a few more than they needed, and those that I worked for comb honey did as well. One swarm put more honey in pound boxes than any one of the eight did in their combs. They won't work in the chaff hive with ten frames below the sections, for they have too much room below; that is, with a good many swarms you want to put wide frames below; they won't work in the outside boxes at the top. The frames ought to go the same way at the top as the bottom.

FUMIGATING COMB HONEY WITH SULPHUR.

I should like to ask Doolittle one question: Does his comb honey taste of sulphur? We sulphured some, and it spoiled the flavor of the honey, and it was not quite strong enough to kill all the moth.

Suffield, O., Feb. 12, 1884.

LEVI FAYLOR.

Friend F., I am glad to have your opinion that separators do not hinder the production of comb honey, but I am inclined to think it does make a difference, after all. Were not those colonies that had plenty of empty combs a little lazy, or was not their queen a little behind the one that had one-pound sections? I have myself sometimes thought that when bees got real animated (if that is the proper word to use), in filling one-pound sections they would do more work than some others that had so many empty combs they had no room or chance to build any.—I do not think the sulphur would give the honey a taste, unless you used too much of it. If I am correct, friend Doolittle has put in a caution in regard to this.—I have never been able to discover that it makes any difference whether the upper frames run parallel with or at right angles to the frames below.

ABSCONDING BEES, AND FIXING A LOCATION BEFORE THEY SWARM.

Last summer, just before dark, I took notice of a certain strain of bees. They came in very tired when there was no honey. What they were doing, was a mystery to me. Just one week after this, a neighbor came before breakfast with a wagon, salt-barrel, boiler, and pans, and wanted me to help him cut a bee-tree. We went and looked at the tree. The bees were working at three holes in the tree, and he asked me if I did not think it was a large swarm. I told him I thought it was, but it looked to me as if they were cleaning house, and it would be better not to cut the tree until evening, to save the bees. When we cut it down there was only one bee left in the tree. When the tree was cut down, I knew they were my bees; he thought I ought to give him a swarm of bees, for he had saved me one by cutting the tree. I did not lose any swarms last summer, that I know of.

Columbia, Mich.

ALMON ACHENBACK.

AN APOLOGY.

I do hereby wish to make the statement that I was wrong in signing the name Theo. O. Peet to the article which you published in GLEANINGS concerning the card which was written to me, which was signed Col. & Clery. It was written and signed in "signature" style, and any one at a glance would make it out as I did. I would have made this statement sooner, but I was positive that I was right, and I could not find the card at the time; but recently I

chanced to get hold of it, while looking over a heap of postal cards. I am sorry for having made such a blunder, and humbly beg pardon. A word in regard to the egg preservatives. I did not mean that they are a complete failure; I simply meant the costly receipts and impositions.

J. T. FLETCHER.

West Monterey, Pa., Feb. 11, 1884.

Friend F., I am glad to get your apology; but I must say that it is a rather serious matter, saying a certain document, or even postal card, was signed by a man who never saw it, and never had any thing to do with it. The fact that Theo. O. Peet did at one time have charge of the business, and was in the habit of signing postals and letters, might make it easier for you to make the mistake. I know their signatures were very brief and imperfect, and I was tempted to think sometimes that they were purposely made blind. In fact, orders came to us without any signatures, and I was compelled to write back and ask who was responsible for the goods ordered from this institution.

SWARMS THAT WE DON'T WANT TO KEEP OVER WINTER; WHAT SHALL WE DO WITH THEM?

Could we take away the queen in August, and keep queen-cells cut out so that they could not raise another, or would it be best to cage the queen and leave her in the hive, but prevent brood-rearing? or would either pay where we care more for honey than we do for young bees?

J. P. DUNLAP.

Lone Star, Neb., Feb. 14, 1884.

Friend D., my plan would be to sell the queens for something. You know we now have a department for those who have hybrid or black queens that they will furnish to others for accommodation, and we make no charge for notices in this department. Well, after you have sold the bees, take them and the brood to strengthen other colonies, till you get your colonies very strong. This will prevent the production of brood, and you know prevention is always better than cure.

MAMMOTH RED CLOVER, AND SOMETHING ABOUT ALSIKE FOR HAY.

Allow me to say a discouraging word about mammoth red clover for honey. On an average, my bees have had at least 200 acres within reach every year, and as yet have not given one pound of surplus from it; and on only one occasion any in the body of the hive—that was in 1881. I have raised it on my farm for ten years, and am well acquainted with all its habits, and can say safely, I would rather have one ton of my alsike hay than four times the amount of mammoth clover.

For the improvement of land it has no superior; but if any man sows it purposely for honey, I fear he will find himself mistaken in its qualities.

Thorn Hill, N. Y., Feb. 11.

C. M. GOOSPEED.

Well, friend G., you give us a heavy testimonial in favor of alsike for hay, even if you don't speak so well for mammoth. Speaking of alsike, I notice it is now regularly quoted in our market reports, and it seems to have become a staple seed. From present indications, I presume the price will this year run up to \$15.00 as it did last. What are the farmers about, that they don't raise more alsike, with such prices as these offered? Our honey farm is at present seeded to

alsike, and we expect to get a splendid bloom this coming season.

UPWARD VENTILATION, ETC.

Please let me speak my piece. I am an A B C scholar, and enjoy my studies very much. I went into winter quarters with 7 good swarms — 4 in chaff hives, and 3 in cellar. I examined those out of doors yesterday, and found them in fine condition. One of my hives in the cellar had no upward ventilation; I noticed the bees were spotting the entrance, and supposed, of course, they were dying with dysentery. I tried your suggestion on page 69, A B C, by taking the hive into a warm room, and fixing a square frame covered with thin cloth over it, and letting the bees out. They came out of the hive, but did not empty themselves. The hives right by the side of this one are all right. They have good upward ventilation.

Last fall I noticed that a strong colony of Italians were killing off a rather peculiar-looking bee. The abdomen was small and black and glossy. What were they? and why did the other bees kill them?

TO PREVENT BEES BUILDING COMBS BETWEEN THE UPPER AND LOWER FRAMES.

Paint the lower side of the upper frame, and the top side of the lower frame. J. F. ORWICH.

onia, Mich., Feb. 9, 1884.

Friend O., I think that those small and black glossy-looking bees were some affected by the disease I have mentioned in the A B C book, toward the close of the article, page 63. I believe it is well known that painting the frames will prevent the trouble you mention, or, at least, to a certain extent. The only objection that I know of is the trouble and expense of doing it.

SEPARATORS OR NO SEPARATORS.

This is one of the leading questions of the day, and perhaps one that some would like to hear about, as much as any thing. I have had some experience with sections without separators. I have tested many things as soon as I heard of their invention, and some of my own invention that pertain to bee culture, and the most profitable way to get money from bees. During the year 1877 I had something over 1500 5x6 sections in use without separators; some were filled full of foundation, others partially, and others with natural-comb starters. I used four different kinds of boxes that season. I have experimented with boxes holding 80, 40, 30, 25, and down to 2-lb. sections; and when I got there I stopped, and I do not think I shall go below this size, before next season opens, and then slow.

There is no doubt but that better results can be obtained in regard to straightness, with a 1-lb. section, than with a 2-lb. section, without separators. But I would not use either without separators. It is true, beyond a question, we can get more honey without separators than with, for we approach nearer a large box; and the nearer to a box of the capacity of the surplus of the colony we get, the more surplus.

But, there is another side to the question: I find the net profit is on the side of separators, to say nothing of the disgust of bulged combs, leaky packages with many combs bruised, and more mutilated that have to be extracted. The grocerymen growl about flies, ants, and careless clerks taking off the profit. The middle men complain, vow, protest, and curse the poor bee-keeper for educating the consumer to small unglassed sections, and tell us that

where a man buys a 2-lb., he would, three times out of five, have bought a 6 or 8 lb. box, if the sections had never been introduced, and they could handle more honey in a season. The groceryman would buy as in former times, and more honey be consumed, though perhaps by a less number of persons. It is not the largest amount that we are after at the present day, but that in such shape that it will bring the best price and a ready market. Go cautious, if you are a beginner, and have had but a little experience; the older ones, as a rule, will take care of themselves. WM. H. BALCH.

Oran, N. Y., Feb., 1884.

A CHEAP AND EFFICIENT PASTE FOR PUTTING LABELS ON TIN OR ANY OTHER SUBSTANCE.

I herewith send you directions for making a paste, which I value very highly for fastening paper or cloth to tin, etc. I knew of a New York firm that gave another considerable for this recipe. I wish you would carefully make paste by this formula; and if you find it worth publishing, do so.

I have often seen the labels on extracted honey, earned goods, etc., broken by a very light pressure, thereby destroying the neat appearance of the goods. This is often, I think, the result of using a paste that does not adhere firmly to tin. If a paste is made according to the directions I herewith give, I think it will be found worth the extra trouble in making.

Make a very thin batter with flour and cold water (not more than half as thick as for pancakes), taking care to rub out all the lumps. A pint of this batter is enough to make a four-quart pan as nearly full as will work conveniently. Set this on a moderately hot stove, and at the same instant pour from a teakettle boiling hot water till three-fourths full, stirring rapidly at the same time, to prevent burning. I hold the dish with one hand and stir, or, rather, *scrape*, the paste with a putty-knife with the other hand, while another person pours in the water. If great care is not taken, the paste will burn, or become lumpy. Cook 5 minutes. So far, this paste is simply a good paste for papering walls. Now add about one-eighth as much of the cheapest, darkest-colored Porto Rico molasses that can be got, and cook for 10 minutes longer. It may be that any cheap molasses will answer, but I was particularly cautioned to use none that was adulterated, so I have never tried any other than the above named. I get it at a grocery that has a large low-class trade. If carefully made, the paste is now ready for use, rubbing out smooth and free from lumps. If lumpy, squeeze through cheese-cloth or a thin linen towel. If too thick, I thin with hot water. This paste, if made with the right kind of molasses, will be found to adhere firmly to tin, glass, or any other substance used for packages for honey. ELLIS MEAKER.

Owaseo, N. Y., Feb. 6, 1884.

HOW SHALL WE PREVENT INCREASE OF COLONIES?

How shall we keep our bees together, and thus control the business? We don't want to keep making hives, to accommodate additional swarms after we have enough for the territory. Friend Root, I think this a very important point, to decide the best plan for keeping our bees together. Will it do to move the bees and brood that remain in the parent hive, in with the swarm just cast? I should like to hear about this question, before swarming-time.

New Providence, Ia.

A. LINDLEY.

I think your best way, friend L., is to sell your surplus stock. Selling bees is generally

found to be as profitable as selling honey, and a bee-keeper can not very well get along without it, after a certain limit.—Putting the brood in with the swarm is the plan recommended by our old friend Adam Grimm, and it works nicely, provided the swarm does not get a swarming mania, and swarm so much the quicker for having such an increase in numbers.

LAZY BEES.

With your permission I will relate my experience in battling with the world, the flesh, and the bees. I didn't say honey-bees, for my bees have had very little to do with honey as yet. I struck in last spring with five colonies of black bees in old box hives. They have now increased to 18, six of which I put into home-made Quinby hives, and the rest into box hives and nail-kegs. The kegs are full, and the frames are partly full of comb, built crosswise. I have taken about 5 lbs. of honey in sections.

Some of the swarms have hung out of the hives all summer, doing nothing with boxes in the hives. We put two small swarms together; they killed or lost both queens, and are now a mere handful, with as many worms as bees. What should I have done? Basswood, white clover, goldenrod, motherwort, and catnip, all grow within bee distance of us. What makes my bees so lazy?

M. E. G.

Ogden, Mon. Co., N. Y., Aug. 20, 1883.

Friend G., I really do not know what makes your bees so lazy, unless it is those colonies with the combs built crosswise. Give them some nice new hives with one-pound sections, and may be you can raise a little enthusiasm in their little heads or hearts to get up and "dust," and do something instead of hanging outside.

ABSCONDING WITHOUT CLUSTERING.

June 10, 1882, I stood near a hive and heard the piping of the queen in said hive. Presently, out rushed a very large swarm, and started immediately, a little east of north; they rose very high, as they had to pass over a grove of Lombardy poplars about 20 rods distant; after passing that barrier they lowered to the usual height. There being a large lake about 70 rods from the apiary, they came quite low, near the margin of the lake. There being a gravel walk, I ran ahead and met them with handful after handful. They did not seem to like that kind of treatment, and turned south-east and went to an island in the south part of the lake, and clustered in the top of a very tall second-growth white-oak. I got an ax and hive, my son accompanying me. We went and cut the tree, my son taking the boat, I staying on the island. The bees flew about half an hour over that part of the island, then over the lake several times, and alighted on a low limb where we soon had them in the hive and apiary, where they remained satisfied.

About ten days later I hived a large swarm. Before they all got in, another swarm came out close by, and went in with them. They remained about half an hour, when they all came out and separated, as near as I can tell, about equally; the one clustering, the other going for parts unknown.

The first of July following, another swarm absconded without clustering. In every case I was there and saw them come out of the hive. The last was a second swarm too, and a large one. I have kept bees a number of years, of late quite extensively.

These are the only cases of absconding I have any personal knowledge of; but there was no mistaking them.

W. K. VANSYCKLE.

Drayton Plains, Oakland Co., Mich., Feb. 4, 1884.

FROM 15 TO 40, AND 600 LBS. OF HONEY.

I commenced the season with 15 stands, all in good condition, strong enough to swarm in April; but I prevented it by giving plenty of room. They commenced swarming the 5th of June, and they increased from 15 to 40 stands, with plenty of stores for winter, all alive at the present date, and in good condition. I took over 600 lbs. of comb honey—500 in one and two lb. sections; did not extract any.

NO SEPARATORS.

What I wish to notice is this: That in the 500 lbs. in sections, no separators were used—nothing but half-inch strips of worker fdn. for starters; the sections were 1½ inches wide, as you make them. Result, every comb was built straight, and in no case was there a comb built between. My reason in the first place is, that bees delight to work on nice yellow fdn., and if kept supplied with sections and starters, will have no inclination to work on any thing else.

LARGE ENTRANCES TO THE SECTIONS.

I make my sections with ¼ inch space, so that when two are placed together it leaves ½ inch opening, giving them no chance to build between, and at the same time making a nice-appearing comb, with the outer edges rounded.

H. HOMERIGNS.

Royalton, O., Feb. 18, 1884.

MRS. COTTON.

Mrs. Cotton, of West Gorham, Me., found out that I wanted to get some bees, and she sent me a big offer. I paid her \$20.00 for a full colony. They came, and I put them on the stand, and when I came to examine the bees I don't think there was over a handful in the hive, and there was no queen with them; and it was but a short time before they were all dead. I was cheated out of \$20.00 by Mrs. Cotton; but I shall try again.

JAMES H. DUNLEVY.

Adrian, Mich., Feb., 1881.

I am sorry to hear such reports, friend D. I suppose, of course, you notified Mrs. Cotton of the condition in which the bees were received, although you do not say so. From the great number of similar reports from her customers, we can not help but conclude that she is not in the habit of making good the colonies that are received in such condition; and as she advertises quite extensively, inquiries are coming almost every day, as to whether we would advise purchasing of her. We have such inquiries about other supply dealers, as a matter of course; but all who now advertise, so far as I know, are reliable, and make good all dissatisfaction. If Mrs. Cotton proposes to do this, I will cheerfully give space for her to say so.

MODERN SEPARATORS.

I notice complaint is made that wooden separators warp. Having used them many years, made of what is here called poplar, the tulip, or whitewood, of some sections, and liriodendron botanically, I find no trouble. I use them now as thin as 1-16 of an inch. If taken care of, and not left to the weather, they keep true and dry. They become slightly coated with wax by use. I should prefer them to tin, which I have used, if the latter were furnished without cost.

J. W. PORTER.

Charlottesville, Va., Feb., 1884.

SPEAKING IN ANOTHER LANGUAGE THAN YOUR OWN.

I hurt often of your bees. I would like to know how you are fixed in bees. Please and write me about your price list of your books or hive boxes. I start over two years with bees, and I got plesner with them. And my address is in Reading postoffice.

Reading, Pa., Dec. 30, 1883.

ERNST DRUETE.

I wonder how many of the friends have tried telling something they wanted to tell, in a language foreign to their own. How quaint and odd the ideas sound! Here comes a little note from a friend who loves the bees; and although his words sound oddly and strangely to us, yet we know that it is a kind heart that prompts them. I am glad to know, my good friend, that you find pleasure in working with bees. But I do not believe there is one among us who could have told it much better than you have done, even if you are evidently not very familiar with our language.

THE CONTROLLABLE HIVE.

I have had some circulars sent to me, and I thought that they would make you smile if you could see some of them. I know that Mrs. Cotton would not send you one, so I will do so; but I think there must be much exaggeration in her circular; and if it is not in the circular, it is in the bees she sends out. I have one of her hives. I put a swarm of bees into it, and they did not do well. I transferred them in August, and put them in a chaff hive, and they did more work in a week than they did in six weeks in the Controllable hive. If I were to have my choice, give me a good half-breed. I began last spring with three swarms that I wintered. I now have 13 good strong colonies, and I took from the three, 100 lbs. of good comb honey, made in boxes. I have made up the 500 sections that you sent, and I broke only six of them, and I thought that was good.

Taunton, Mass., Jan. 28, 1884.

E. W. STAPLES.

MRS. COTTON AND HER ADVERTISEMENT.

HONEY BEES.

THE NEW SYSTEM OF BEE-KEEPING.

EVERY one who has a farm or garden can keep bees on my plan with good profit. I have received one hundred dollars profit from sale of box honey from one hive of bees in one year. Address MRS. LIZZIE COTTON, West Gorham, Me.

I inclose an advertisement clipped from the Providence (R. I.) *Daily Journal*. Is there no stopping the fraud? Now, it would be impossible to tell how many poor people, hoping to increase their income, have sent to Mrs. C., to their sorrow. The inclosed advertisement has appeared several times; she also had an advertisement in the *Journal* last year.

A. C. MILLER.

Barrington, Bristol Co., R. I., Feb. 14, 1884.

Friend M., I know that many are disappointed in sending to Mrs. Cotton, but there are others who have succeeded very well with her hive and instructions; in fact, I have aimed to give both sides of the matter through our columns. The point under discussion is, whether it is a fraud to charge \$4.00 for a sheet of paper giving drawings and directions for making a hive, or not. I should call it a fraud, but others think differently. As the book which she includes with the \$4.00 is sold for a dollar, the purchaser really pays \$3.00 for one sheet of paper. It is well known that her process is nothing particularly different from what is already known and in use.

Blasted Hopes,

Or Letters from Those Who have Made Bee Culture a Failure.

I THINK I can give you a good report for Blasted Hopes, as mine have been blasted from the beginning. In 1876, I think, I bought a swarm of black bees in box hive; 1878 I bought 4 more of same description. I have bought lots of Italian queens, and raised more from pure stock; bought an 8 or 10 dollar imported queen of you, which was of no use to me, as queens raised from her were all poor things, no matter how raised or used. Her stock has never given more than a few pounds of honey, and was never very strong (and is now dead). But don't think I blame you for this. I have spent hundreds of dollars in different ways for my bees; have had as high as 35 swarms, but now have lost all but 7, and those left are in poor condition, and I guess will go before spring. I have never sold \$1.00 worth of bees, and not honey enough to pay for a tenth of the sugar I have fed them. I have spent a very large part of my time on them, hoping to reap some reward after a while. I don't think my failure due to poor management, for I had hives running over, full of pure Italians of different strains, all through the honey season of each year, time and again. I have used every thing possible to aid the bees, but no honey, and I am convinced that the trouble, and the only trouble, is that this region does not produce any honey, and that even Doolittle, if placed here, would not raise 200 lbs. of honey per year. I am sick of keeping bees here for profit, and will sell my combs and fixings in spring. I am not robust, so I had hoped to make something from bees, but it has been the opposite, with a vengeance.

And now I will tell you something about my troubles in selling honey this fall, as you know I sent to you for labels, tumblers, etc. Well, I got some of the finest extracted honey from a friend in Vermont; also some from two bee-men in Ohio and Wisconsin. It was splendid pure honey. I put it up in 1-lb. tumblers, labeled it nicely, telling all about it, guaranteeing it to be pure and of superior quality, wrapped each tumbler in nice paper, and started out. I left a tumbler at each house, stating that I would call again in a few days. I sold for 22 cents in tumblers, and 18 cents loose. I worked hard for 6 or 8 weeks in trying to sell, but, no; people would not buy, do what I would. I lost none of the tumblers, which I left, but nobody seemed to want honey, and I don't believe would have taken any to speak of, even if sold at 10c. per tumbler, and this in lively towns of 8000 inhabitants, without competition either. I sold, perhaps, 200 or 300 lbs. in all in this way. I shipped 500 lbs. in kegs to Boston, after getting discouraged, and got 2c. less per lb. than I paid. I have 100 tumblers full on hand, and am likely to keep them, as nobody likes honey hereabouts.

Now, friend Root, tell me why I failed to sell, if you can. Comb honey did not sell any better. It is a mystery to me, as I had not the least doubt but that any thing so fine as this honey was would sell like fun.

F.

Worcester Co., Mass.

Friend F., I am inclined to think your worst trouble was, you had not built up a trade on extracted honey. Friend Hutchin-

son's piece in our last journal, it seems to me, covers the ground.

ONLY \$15.00 PER POUND FOR HONEY.

Perhaps you would like my report for the last two years, but you would put it in Blasted Hopes. My hives are as bright as ever, and the honey that I have taken from the bees has cost me but \$15.00 per lb., and I can stand that, unless I have to take too many pounds. When you want something *not profits* from bee-keeping, let me know.

Pittston, Pa., Jan. 21, 1884. R. H. GRIFFITHS.

Why, friend G., your letter is a treasure for this department; but it seems to me that you ought not to be so happy and smiling about it. I suppose all that worries you is the fact that you may get too many lbs. of honey. Sad, isn't it? Don't you think you could figure that honey down so it would not cost more than about \$14.75, if you tried hard?

from alsike clover; did not get any fall honey. My bees are all on the summer stands; the most of them in double-walled hives. I sold my honey all at home, at 10 cts.; could have sold more, if I had had it. It has been very cold here — 22° below zero.

NORMAN GOODNOE.

North Lansing, Mich., Feb. 4, 1884.

DR. LAY HOPEFUL — HORSEMINT.

Our bees are in fine condition. Only one cold spell, ther. 24°, Jan. 1; 18°, 2d. Warm and fine again. I think we have enough supplies for this season. Horsemint is abundant. We had very light honey-yield last season, but we are hopeful for the coming one. You will not find us in Blasted Hopes, for we are arming for the fight. Wishing you much success this year, I remain yours truly,

J. E. LAY.

Hallettsville, Texas, Jan. 3, 1884.

FROM 18 TO 54, AND 1160 LBS. OF COMB HONEY.

In the fall of 1883 I went into winter quarters with 20 colonies packed in chaff. All came through nicely and strong, with the exception of one which did not swarm. From the other 19 came over 50 swarms, which I doubled, so I had 34, making me now 54 colonies in all. Now for my report:

To 34 colonies increase, at \$5.00 per colony..... \$170 00
 1100 lbs. in sections..... 154 00

Total, \$324 00

I think if I am correct, that is \$16.20 profit, per hive, spring count, which I think not a bad investment. All that my expenses were was for sections and foundation.

HARLEM C. WELGAR.

Monterey, N. Y., Feb. 10, 1884.

FROM 10 TO 24, AND 10 LBS. OF HONEY TO THE HIVE.

I began the season near Vistula, Indiana, with 10 weak stands, most of them nearly "played out;" had to commence feeding in February, and as I had not the means to buy plenty of feed I gave them just enough sugar syrup and candy to keep them from starving until they could shift for themselves. Many in our neighborhood lost all their bees last winter and spring, and others who saved a part complained of the poor honey season. Of course, my success was nothing compared with the big reports you get from other localities; still I do not think that you will put me *quite* at the foot of the class. My 10 stands averaged a little over 50 lbs. of surplus honey to the stand, and increased by artificial and natural swarming to 24. As I was making preparations to move, I sold the honey for just what I could get at that time, and also a part of the increase at a sacrifice. Sold some of the finest one-pound section honey for 15 cents per lb.; and rousing big swarms, with \$5.00 worth of honey, for \$5.00; yet my account shows as follows:

Net proceeds from sale of honey and bees (deducting cost of sugar feed, hives, fdn., etc.)..... \$87 10
 Honey used in family (low estimate)..... 10 00
 Growth of apiary, 8 stands at \$5.00..... 40 00

Total, \$137 00

In October we moved to this place, bringing with us 18 stands of bees; shipped them in an ordinary freight car with our household goods. I examined them a week ago, and found them in fair condition, some of them having sealed brood which must have been started when mercury was away down below zero. I winter out of doors, packed with clover chaff. Now I will see what they will do for me in the Buckeye State.

S. P. YODER.

East Lewistown, Mahoning Co., O., Feb. 12, 1884.

Reports Encouraging.

FROM 5 TO 19, AND 1354 LBS. OF HONEY.

HERE is my report for the season of 1883; I have tried to raise bees for honey, but never got as much as I could eat till after I read the A B C, and took GLEANINGS, which is two years ago. I commenced last spring with five colonies, and increased to 19; bought 1, which made 20. I commenced to extract June 14, and got 155 lbs.; June 23, 190 lbs.; July 5, 202 lbs.; July 17, 181 lbs. Total extracted, 728 lbs. I commenced to get box honey the 15th of July, and closed up Sept. 26, taking the boxes as soon as capped, so as to have it white as snow. The total amount of box honey by weight was 626 lbs.; adding the extracted, 728 lbs., it makes a total of 1354 lbs. from six stocks in the spring. How is that? I have also 40 lbs. of unfinished sections to commence next year. The mercury was 34° below zero in January, and I lost only one colony. The rest are all right. I use the Simplicity hive and 4¼ x 4¼ sections, and get 10 cents per lb. for extracted honey, and 18 for comb. My bees are mostly Holylands of I. R. Good's stock.

ROBT. S. GIBERSON.

Roodhouse, Ill., Feb. 6, 1884.

FROM 8 TO 41, AND 300 LBS. OF HONEY.

I began last spring with 8 swarms; increased to 41, all in good shape, all by natural swarming, and got about 300 lbs. of honey; that is, comb and extracted all together.

LOUIS WEINER.

Edwardsville, Ill., Jan. 15, 1884.

FROM 8 TO 14, AND HALF A TON OF HONEY.

I had eight swarms of bees last season, which gave me 1000 lbs. of box honey, and six new swarms. I think I can afford to take GLEANINGS this year.

Geddes, N. Y., Jan. 22, 1884. M. C. DARROW.

FROM 2 TO 8, AND 300 LBS. SURPLUS.

I started in the spring of 1883 with two colonies; increased, during the summer, to 8. At this writing they are all right yet. Got about 300 lbs. surplus honey. We are using the chaff hive.

S. M. SMITH.

Campbell, Mich., Feb. 4, 1884.

FROM 7 TO 18, AND 600 LBS. HONEY.

I commenced the season with 7 colonies in fair condition, and increased to 18, and all are in splendid condition up to date. Extracted 600 lbs., mostly

"Remindery."

Or Department for duties to be attended to this month.

FRIEND ROOT:—I see by Feb. GLEANINGS of the 15th that your bees are light of stores. Probably there never was a year when there were so many in the United States; and probably you could not do a greater favor to your many readers than to tell how the candy is made, and give a description of the Hill device in your next issue. I have not the A B C, and thousands of others have not.

GEO. W. BATTEY.

Selpioville, Cay. Co., N. Y., Feb. 23, 1884.

Making candy is a very simple matter, friend B. Just put some granulated sugar into a tin pan; pour on a little water, just as you would to make molasses; then boil it until it sugars off by stirring in a saucer. When it grains nicely, and gets hard when cold, take the pan from the fire, stir it until it gets about as thick as you can spoon it out, then ladle it into small pans or basins, greased a little so the cakes will come out readily, and let it cool. If you are a new hand at the business, try say one pound until you are sure you won't burn it, and know how to cook it just hard enough. Lay these cakes right over the cluster. There is no particular need of any Hill device so late in the spring as this; but you will see a picture of this in the price list, if you do not understand it. Maple-sugar cakes may answer just as well; but if we should have severe cold weather yet, it might produce dysentery, if the quality were not very nice and pure. Granulated sugar is always safe for cold-weather feeding. We have not lost any bees yet; but we do not mean to hurrah before the first of May.

CONVENTION NOTICES.

The spring meeting of the Progressive Bee-keepers' Association will meet at the residence of J. B. Haines, Bedford, Cay. Co., O., on Saturday, May 3, 1884. All are invited. J. R. Reed, Sec. L. E. Brown, Pres.

There will be a meeting, Mar. 15, at 10 A. M., in the Council Rooms, in Vassar, Tuscola Co., Mich., for the purpose of organizing a County Bee-keepers' Association. M. D. York.

Millington, Mich., Feb. 18, 1884.

The annual meeting of the New Jersey and Eastern Bee-keepers' Association will be held in Room 24, Cooper Union, in the city of New York, on Wednesday and Thursday, March 12 and 13, 1884. The meeting on Wednesday begins at 10 o'clock A. M. J. HASBROUCK, Sec.

The Iowa Central Bee-keepers' Association will hold their semi-annual meeting in the Court-House, on Friday, April 18, 1884, at 10 o'clock A. M. All are cordially invited to attend. All visitors from abroad will be hospitably cared for. Members of the association are requested to bring their baskets well filled, and we will have a general good time. Any one having any new apianian implements, or any thing that will advance the interest of the association is requested to bring them for exhibition. J. E. PRYOR, Sec.

Maple Grove, Iowa, Feb. 12, 1884.

Well, now, friends, that is hospitality in good old backwoods style. I wonder if they will have any honey for their lunch. If they have some as nice as that which Mrs. Culp

brought to our Columbus association, with some good nice bread, such as our bee-keepers' wives know how to make, and plenty of milk by the "jugful," I think I should like to be there about dinner time. Wouldn't you?

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.

MEDINA, MAR. 1, 1884.

Shall any teach God knowledge?—Job 21:22.

SPIDER-PLANT seed has advanced from \$1.00 to \$1.50 per lb., or 20 cts. per oz., selling price.

BEESEX is about one cent higher than we last quoted. But as we have a pretty good stock on hand, our prices for the present will remain unchanged.

We rejoice in being able to tell you that our subscription list stands at 6278—a gain of 456 since last month. In December we were 6788, but we shall doubtless be beyond that before April. Thank you.

We are buying No. 30 tinned wire in such quantities now that we have been enabled to reduce the price to 20 cents for a single pound; or in coils of from 5 to 10 lbs., as it comes from the factory, for only 16 cents per lb. No. 36 wire, one-half more than the above prices.

SUNFLOWER SEED.

We are all out of mammoth Russian sunflower seed. If anybody has any for sale, will he please send a sample and give price? We had a great bin full, but it went all of a sudden. Our friend "Lu" suggests that Oscar Wilde is to blame for this sudden mania for sunflowers.

ALSIKE CLOVER.

JUST as we go to press we have secured by telegram a lot of 25 bushels of beautiful clean alsike, which we will sell, as long as it lasts, at \$11.00 per bushel; \$6.00 per half-bushel; \$3.50 per peck, or 25 cents per lb. The above includes bags. If wanted by mail, 18 c per pound extra, for bag and postage. We can ship it by first train to any who may want it.

SPEAKING of Alley's drone-trap, I omitted to note that the machine will make it a very easy matter to get a boxful of choice drones from any hive we wish to breed from, and introduce them to any queenless hive we wish. Several times during the last summer we had orders for a cage of drones, and it was quite a job, I tell you, to catch and cage one hundred or more.

PEA-VINE, OR MAMMOTH RED CLOVER.

We are having quite a brisk trade in the pea-vine, or mammoth red clover; and if you have never seen any, it might pay you to send for a 5-cent package. A great deal is sold for mammoth pea-vine clover, but it is not the genuine. We once purchased enough seed for several acres; but when it came into blossom we were chagrined to find it was only the common red clover.

I SUPPOSE many of the boys and girls who take GLEANINGS are fond of magazines, like Blue Eyes and Caddie. What magazine ought a wise parent to give them? My wife asked me that question, and I replied, "Arthur's Home Magazine, by all means." Every time I pick up a number I feel more satisfied I was right about it. For more than thirty years I have found pleasure and profit in looking over its bright pages.

ONE THOUSAND SIMPLICITY BEE-HIVES AT A SINGLE ORDER.

OUR enterprising friend C. M. Dixon, of Parrish, Ill., has just sent us an order for 1000 Simplicity bee-hives, with other things to match. The goods were dispatched in less than a week. Little did I think, when I first invented the Simplicity hive, that we should manufacture them at such a rate as to sell 1000 at a single order.

CHEAP INK.

I WAS just led to smile by noticing that our proof-reader used for his shorthand writing a bottle of Oldroyd's bluing. When I asked him about it he said it was better for his work than any ink he could find, because it does not spread on the paper as most ink does. As we sell a great big bottle for only five cents, it has the merit of cheapness, besides the other quality. Friend O., what is the reason you never said before, that your bluing makes the best kind of ink?

CHEAP PAPER.

WHILE speaking of cheap ink, I am reminded that we have also some very cheap writing-paper, used in the various departments of our factory, as well as by the shorthand writers. It is simply the GLEANINGS paper which we advertise elsewhere at 15 cents per lb. In order to have it ruled just as we want it, we do the ruling on the printing-press, and we can furnish it to you in sheets the size of this page, or a little larger, already ruled on one side, for 20 cts. by the single pound; 18 cts. in 10-lb. lots, or 15 cts. in lots of 100 lbs. In quantities of from 10 to 100 lbs., we will print on a letter-head, without any additional charge.

CHEAP MATCHES.

NEXT to a good smoker is a good match to light it with. As the largest match-factories in the world are in the neighboring city of Akron, we are enabled to give special rates. We have now the best drawing-room or parlor matches in boxes of 200 each, for only 3 cts. per box. The box is a neat little case arranged so as to hang nicely against the wall. On counting the matches we found 240 in a box, instead of 200. We can send you one gross of these boxes, packed in a neat case, for an even \$3.00, which will be only a trifle over 2 cents per box. If you can not use the whole case, your neighbors will probably be glad to take a part of them at this extremely low figure.

PUT ON YOUR COUNTY.

WE are now receiving so many letters without the county, that we are obliged to employ a clerk to take the letters as fast as they are received, and hunt up the county from the Postal Guide. Even with all the helps we can get, we are liable to make a mistake, because no one knows what county you live in, as well as you do. No one can put on the county as easily as you can. Will you not try to help us, friends, by having it written in, or printed in, especially where you order goods by freight or express.

SENDING MONEY.

YOU may think it is strange when I tell you that a great many people, when they inclose money, neglect to say how much they inclose. Now, if you don't say so, how are we to notify you promptly that it was not all there? Quite a number of jangles are now under way on account of this very omission. Always tell how much you send; and I would recommend a postal order or a draft where you can get it. Even with registered letter, or money by express, we have had quite a few troubles, because the amount claimed to have been inclosed was not all there when the package reached us.

In speaking of Mrs. Cotton's book, I omitted one important point, I notice. It is this: You pay her a dollar for a very small-sized book on bees—much smaller than any of the bee-books before the public, for the money. Now, when we buy a bee-book we expect to find in it full directions for making the hive the author recommends. Not so with this, however. The book gives a picture of the hive, it is true, but informs you that you must send \$12.00 for a complete hive! But you can have diagrams and measurements for \$4.00. As the book is "thrown in" for \$4.00, her real charge is about \$3.00 for "diagrams."

TESTED, OR DOLLAR QUEENS.

ORDERS are already coming in for these, and there are friends in the South who want to furnish them, but I am afraid to undertake mailing them so early in the season. Now, friends, please listen to reason a little. Why not send directly to those in the South who are advertising them, instead of sending to me, to have them go through two shipments? I know, with our facilities, and the experience we have had, we can oftentimes get them to you more promptly, even if they have to go double or treble the distance. But still, it seems too bad to send the poor little insects away up North, and then right back South again, as we often do. If anybody in the Southern States has dollar queens ready to ship now, please tell us so on a card, and we will give his name in our next issue, free of charge.

REVERSIBLE FRAMES.

OUR friends may be aware that we send out nuclei and frames of brood in little boxes having the ends of the boxes grooved like the spacing-board shown in the price list. They are made just right for 1, 2, or 3 L. frames to slide down into the grooves. We have sometimes used them in the apiary in this way; and although it is a little more trouble to slide the frames out of these nucleus hives, where the grooves fit about the frames pretty loosely it is not so very hard after all. Well, now, if you leave off the projecting arms of the frame, they will go in one side up just as well as the other. To prevent them going clear down to the bottom, a nail may be driven part way into the bottom-board at each end of the frame. This stops it, and supports it with scarcely any danger of killing a bee. The objection is, of course, that the bees would, during a heavy honey-flow, wax the frame so fast in the grooves it could hardly be moved. And besides this, the frames could not be moved sidewise; in other words, we should have them fixed at the exact distances, which, I believe, would be tolerated by very few apiarists. For all that, the idea keeps haunting me that the coming frame is to be all alike all around, with no projecting arms.

CIRCULARS RECEIVED.

M. C. von Dorn, Omaha, Neb., sends out a 4-page price list.
F. A. Snell, Milledgeville, Ill., sends out a nice 20-page catalogue.

Butler & Luther, of Poyntette, Wis., send us a very pretty 6-page circular.

C. H. Hicks, Fairview, Md., contains out a 4-page price list of queens and colonies.

J. D. Goodrich, East Hardwick, Vt., sends out a 6-page catalogue, nicely gotten up.

A. W. Cheney, Kanawha Falls, W. Va., sends us a 4-page list of Italian bees and queens.

Dr. G. W. Young, Lexington, Mo., sends out a 4-page circular in regard to hives and bees.

E. Kretschmer, Iowa, sends out a 20-page catalogue; new pictures and new matter.

We have just printed for Chas. D. Duvall, Spencerville, Md., a 7-page list of bees and queens.

Miller Bros., who were burned out last year, have risen up again, and send out a very pretty 8-page catalogue.

S. C. & J. P. Watts, Murray, Pa., have sent us their annual price list of apiarian supplies. It is tastily gotten up.

J. W. K. & A. G. Shaw, Loreauville, La., give notice on a postal card that they are now ready to fill orders for nuclei.

The Apianian Supply Co., Wilton Junction, Ia., send us a 22-page catalogue, containing also a list of beekeepers' names.

James B. Mason, Mechanic Falls, Me., sends us a pretty little catalogue of over 40 pages, much of it being quite interesting reading matter.

The Berlin Fruit-Box Co., Berlin Heights, O., send us a 4-page circular, mentioning some important improvements they have made in making one-piece section boxes.

C. F. Muth, whom everybody knows to be a good man, sends out a 24-page catalogue, and interesting reading matter. It will do business, and much interesting matter. Among the pictures is Blanton's Simplicity hive.

Chas. H. Lake sends out a 4-page price list, descriptive of his new one-piece sections, at only \$5.50 per 1000. It is a pretty neat section for the money; but as it is shaved from the log, it will hardly equal those sawed and planed.

The Ontario Bee-Keepers' Supply Co. send out a 40-page circular, full of pictures, and interesting reading matter. It will do business, and much interesting matter. Among the pictures is Blanton's Simplicity hive.

J. V. Caldwell, Cambridge, Ill., sends out a 4-page price list, including that of 1000, but he leaves the price blank, and writes it in with a pen. I don't know but it would be a good idea for a good many of us to do that way at this time of year.

Will Ellis, St. Davids, Ont., near Niagara Falls, sends us a very nice 4-page catalogue, and interesting reading matter. It will do business, and much interesting matter. Among the pictures is Blanton's Simplicity hive.

The printing was done by our good friend George Cork, of Canada, with whom I stopped at the time of my late visit. When any of the bee-friends visit the Falls, they can remember to call on our friend Will.

E. M. Hayhurst sends out his postal-card price list once more, and concludes with the following sentence: "I do not know that I have a single dissatisfied customer; but if there are any such, and they will write me in regard to the matter, I will do the best that I can to render satisfaction." I wonder if anybody besides Hayhurst has grace enough to stick to that little text. If I am correct, I have never heard a complaint against friend H.

From A. H. Duff, Flat Ridge, Ohio, we have received a list of bees and supplies for 1894; 11 pages. As many of the friends are complaining that the bee-journals are putting the best side of apiculture to the front too prominently, we copy a few words from the first page of friend Duff's little pamphlet: "A person can realize more clear cash, from a few dollars invested in bees, than ten times the amount in acres. One-fourth or one-half acre is all you need. Stock it with bees, and you will realize more profit from your fraction of an acre, stocked with bees and properly handled, than you would from 100 acres. We have farmed and we have kept bees, and have found the difference in favor of the bees. Just let our friend Duff go on: "We have reports, and reliable ones too, of 200, 400, 500, and even 1000 pounds of honey from a single colony. Just think of it! One thousand pounds from one colony!" As we often sell honey at 20 cts. per lb., this would be \$200 the proceeds of one hive of bees. Now I think I can see you toss your prophesies up in the air, and say it can't be so. Well, I wish to give you some little idea of how it is done." Now, you see it is not the fault of the bee-journals at all: it was just these folks who send out circulars who have done all this mischief in getting everybody to go into bee-keeping.

Last, but not least, Robert George Raynor, Rector of Hazleleigh, Malden, Essex, Eng., sends us a copy of his second edition of a little pamphlet of 24 pages on queen introduction. After these 24 closely written pages he closes with the following remarks: "Mr. A. I. Root and the other excellent writers of the B. C. of Bee Culture, remarks on Mr. Jones's plan of 'Direct Introduction.' It is my impression that 100 queens may be turned loose at the entrances of 100 queenless hives without losing more than five per cent on a good average, if it is done during the honey season, and toward the close of a day that has furnished abundant forage. Where queens are plentiful, and apiarians pressed for time, I should recommend this plan of introducing; but if resources, as a friend, Jones wisely remarks, "considerable experience to know just the circumstances under which she will be accepted." These words exactly express my own views and experience; and so far from advising the inexperienced to try the method recommended, I would say: "Successful," to their almost certain chagrin and loss, I would say: "Purchase queens at the head of small nuclei, and endeavor to build up, by paying a little more for them, rather than run a certain risk of losing."

Now, friends, we have given quite an array of catalogues and price lists; and if any of you have spare time rainy days and evenings, I think it will be a good idea to drop a postal card to every one of them, look them over, and compare notes, and keep posted.

ITALIAN BEES.

Full colonies for sale now; four-frame nuclei, or by the pound, later in the season.

E. A. GASTMAN, Deatur, Macon Co., Ill.

200 COLONIES

ITALIAN AND HIGH-CLASS HYBRID BEES

FOR SALE I

THESE bees are in first-class movable-frame hives, with sufficient stores to carry them through the season. I guarantee these bees to be as good or better than those sold by other dealers for double the price, as hundreds of letters in my possession will testify. I have more bees than I can manage, is my reason for selling.

Delivered on board cars during April in good condition. Italians, \$6 50; Hybrids, \$5 50.

QUEENS.

I will sell a limited number only, of choice queens for breeding purposes, at a very low price, considering the quality of stock. Satisfaction guaranteed.

Address, GEO. W. HOUSE, Fayetteville, Onon. Co., N. Y.

ALLEY'S

Drone-Excluder, Queen & Drone Trap Combined.

Sample, by mail, 65c.; express, 50c. In the flat, per dozen, including one made for model (13 in all), \$3 00. Those who purchase a sample can get one dozen in the flat by remitting \$2.50. Drone-excluder, without trap, by mail, 30c.; by express, 20c.; in the flat, not less than one dozen, 15c. each. For description see page 151, GLEANINGS.

Send for our 23d annual circular and price list of four races of bees, queens, and supplies.

517d HENRY ALLEY, Wenham, Essex Co., Mass.

REVERSIBLE-FRAME HIVES.

WHITE BASSWOOD SECTIONS.

SEND FOR CIRCULAR AND PRICES.

5-7-9d O. J. HETHERINGTON, East Saginaw, Mich.

HOLY-LAND & ITALIAN QUEENS.

I shall this season be better prepared to furnish superior queens promptly than ever. Please order early. Satisfaction and safe arrival guaranteed. Tested queens of either race, before June 1, \$5 00; in June, \$2 50; after July 1, \$2 00. Untested, before June 1, \$1 25 each; six or more, \$1 00 each; after June 1, single queen, \$1 00; six, \$5 50; twelve, \$10 00.

I. R. COOD, Tullahoma, Tenn.

At Kansas City, Mo.,

I raise pure Italian bees for sale.

Dollar queens in May, - - - - -	\$1 50
" " " June, - - - - -	1 25
" " " after June, - - - - -	1 00

Tested queens, double the above prices.

Bees per 1/2 lb., same prices as dollar queens. For discounts on large orders, see my circular.

I warrant my dollar queens to be purely ma'cd. I do not know that I have any dissatisfied customers; but if there are any such, and they will write me in regard to the matter, I will do the best that I can to render satisfaction.

517d E. M. HAYHURST, P. O. Box 1131.

1884. For Sale. 1884.

Pure Italian Queens and Bees

FIVE-FRAME (Langstroth Frame) COLONIES

A specialty. Five bright new combs, wired in, covered with young bees, filled with brood and stores with a pure young fertile Italian queen. My queens are carefully bred from best imported and homebred stock. Bees gentle, industrious, and beautiful; better than a natural swarm. I was awarded first premium at St. Louis Fair last fall over quite a number of worthy competitors for best Italian queens and bees. Send for circular and price list.

WILLIAM LITTLE,
Marissa, St. Clair Co., Ills.

5-7-9-11-13-15d

SIMPLICITY B-HIVES,

with 10 frames and cover. 50 cents. The same in flat, 40 cts. Double-story Langstroth hive, with 20 frames, all complete, \$1.00. 1-lb. sections, per 1000, \$3.75.
T. A. GUNN,
Tullahoma, Tenn.

FOR SALE CHEAP.—Bee-keepers, before purchasing standard hives you will save money by writing for prices of my large stock of second-hand hives and double nuclei boxes, which I will sell very cheap; hives as good as new. Order soon. Address ADIN A. SMITH, St. Johnsville, Mont. Co., N. Y. 5-6d

ALBINO & ITALIAN QUEENS

Those desiring to secure pure Albino queens will best accomplish their object by purchasing of the original producer of this valuable and beautiful race of bees. For circulars, address D. A. PIKE, 5-7-9-11-13-15d Smithsburg, Wash. Co., Md.

ALLEYS Early Deep Head CABBAGE.

Every one who has raised that magnificent Cabbage the **Fottlers** or **Brunswick**, has regretted that fine cabbage did not make a thicker head. The **Alleys Early Deep Head** is the successful result of years of careful selection and high cultivation to obviate these defects. As early as **Fottler**, it is as large, is thicker and heavier, bulk for bulk, and brings more in market than any other drum-head; per package 25 cts.; per oz. 75 cts.

Early Etamps Cabbage (new) earliest of all; 10 cts. per package **Guerrande Carrot** (new), remarkably thick at the neck; per package, 10 cts.; per oz. 20 cts. **Perennial Onion** (new), lives in the ground without protection all winter and is ready for use weeks earlier than any other kind; per package 15 cts.; per qt. 80 cts. **Solid Ivory Celery** (new) nearly self blanching; per package 15 cts. **White Bonnieul Cucumber** (new), a mammoth white variety of extraordinary diameter; per package 15 cts. **Dwarf Green Early Lettuce** (new) from France; per package 15 cts. **Banana Melon** (new), it resembles in color and form a huge banana, and has strikingly the same fragrance; per package 15 cts. **Kentucky Wonder Pole Bean**, I have not found in 60 varieties one so prolific, a capital string bean; per package 15 cts. **Marblehead Early Horticultural**, probably the earliest of all beans, and yet a true horticultural; per package 15 cts.; per qt. 80 cts. **Marblehead Early Sweet Corn**, the earliest of all, giving growers a complete monopoly of the early market, original stock; per package 10 cts.; per qt. 60 cts. **Sea Foam Cauliflower**, decidedly the finest variety of all; per package 50 cts. To those taking packages of the entire collection, I will present a copy of either one of my four books on the raising of **Onions, Cabbages, Squashes, Mangold Wurtzels and Carrots**. THE PURCHASER TO MAKE THE SELECTION.

I OFFER \$1000 IN PREMIUMS, for vegetables raised from my seed. Please find details in my seed catalogue; sent **FREE** to all. **FLOWER SEED**—I offer one package each of choice mixed selection from the following varieties, for 45 cents, the retail price of which would be 90 cents: *Asters, Balsams, Nasturtiums, Dahlias, Drummond Phlox, Salpiglossis, Sweet Peas, Hollyhocks, Petunias, Abronia Umbellata*, (very beautiful.)

JAMES J. H. GREGORY, Seed Grower, Marblehead, Mass.

E. BREITENBER, COBURG, MONTGOMERY CO., IOWA.

Honey. ✱ Honey.

Great quantities of it, and great quantities of choicest fruit from new Cuthbert raspberry. I have really found a good thing at last. It is the largest and best red raspberry grown; so say those who have tested it, and so say I. Will stand heat or cold, wet or drouth. Have tested it now for two years, and am really surprised at the quantities of honey gathered from the blossoms; and that, too, when but little is gathered from any other source: bees continue to work on them four weeks.

I make more money from the crop of berries alone, than from any crop grown on the farm. A limited quantity of fine plants for sale; 1½ doz. for \$1.00 by mail, or \$3.50 per 100 by rail.

4-6d DR. B. F. KINNEY, Bloomsburg, Penn.

KIND WORDS FROM OUR CUSTOMERS.

I am very much pleased with my A B C. It is a beautiful book, nice in every way. You are certainly deserving of the prosperity you are enjoying.

ABBIE C. HOLDEN.

Norfolk Cr., Mass., Jan. 9, 1884.

We are very much pleased with the fountain pump, and the Clark smoker is called a wonder by our bee-king. Our bees are bringing in pollen lively today. I am sorry Virgil is finished. The last was the best.

MRS. K. HILTON.

Feb. 2, 1884.

The goods you shipped me Jan. 11 arrived O. K., Feb. 15. Freight charges were reasonable, packing good, marking well done, and that is important; full count, good quality, all satisfactory.

CHAS. WATERHOUSE.

Bayou Chene, La., Feb. 18, 1884.

SOME KIND WORDS FOR OUR PRINTERS.

We wish to say that the price lists you printed for us are a tiptop job. When we first got them we thought them a little large; but I like them first rate now. I can say to all who want job printing done, that A. I. Root is the man to do it.

SMITH & SMITH.

Kenton, O., Feb. 25, 1884.

A BIBLE-MEETING IN THE WOODS OF FLORIDA.

Here in the woods we have started a Bible-class—we call it a Bible-meeting. I am the teacher. We have two Gospel Hymns, and want more.

REV. J. H. WHITE.

Georgiana, Brevard Co., Florida, Feb. 20, 1884.

[May God bless the Bible-meeting, friend W., and all who do there attend.]

TO THOSE INTERESTED IN SILK CULTURE.

I notice in the last GLEANINGS, Mrs. Ashmead's offer. I have at least 120,000 silkworm eggs which I will sell at 10 cents per 1000 to the readers of GLEANINGS, if they will send to me before the first of April. I had them tested by the New York Silk-Culture Association, and they pronounced them "fine and healthy." They are annuals, and Pyrenean race. If you care to give your readers the benefit of this offer, I shall be glad to favor them. Such as I offer, the Silk-Culture Association sell for 25 cts. per thousand. I can not take stamps.

MRS. ANNIE WILLIAMS.

Slick Rock, Barren Co., Ky.

MAILING QUEENS IN FEBRUARY.

The queen you sent me has arrived all safe and sound. I introduced her as directed. She stayed in her cage about 24 hours, when she kindly walked out and made herself at home. I tell you the bees received her gladly. How glad they seemed to be when they found that they had another mother-bee in the hive! She was a beautiful large queen. There were but two dead bees in the cage when she arrived. By the way, bees are busy at work here gathering honey from the maple, and pollen from the alders. My brother brought me the bees from the postoffice. The cage, queen, and bees have created quite an excitement among my neighbors. They never saw the like before. Some of them come just to see the

cage. I think you will get several orders from my neighborhood this spring for Italian queens. I tell my friends you have them to sell, and that you guarantee their safe delivery.

JOHN D. A. FISHER.

Salisbury, N. C., Feb. 25, 1884.

ALLEY'S

Drone-Excluder, Queen & Drone Trap Combined.

Tested queens of either race, before June 1, \$3 00; in June, \$2.50; after July 1, \$2.00. Untested, before June 1, \$1.25 each; six or more, \$1.00 each; after June 1, single queen, \$1.00; six, \$5.50; twelve, \$10.00.
5tfd b I. R. COOD, Tullahoma, Tenn.

Strawberry Plants, \$1.00 per 1000.

The three best early berries—Col. Cheney (early); Chas. Downing (medium); Kentucky (late). Wilson and Crescent, \$1.50 per 1000. 1 doz. of any of the above free by mail, 30c. Send money with order.

Address A. FIDDES,
5-6-7d Centralia, Marion Co., Ill.

EARLY AND GOOD!

TESTED AND UNTESTED QUEENS, raised from the best and purest stock. Price list on application. Send orders at once to

W. J. ELLISON,

6-7-9-11d Stateburg, Sumter Co., S. C.

CLEOME, OR ROCKY-MOUNTAIN BEE-PLANT SEED. Fresh, can be had of C. A. Flory, Hygiene, Boulder Co., Colorado. Sent by mail for 20 cts. single oz., or two oz. for 30 cts. It is the best honey plant in the world; after first sowing, seeds the ground itself. Blooms from June to frost. 5fd

FOR SALE CHEAP—Bee-keepers, before purchasing standard hives you will save money by writing for prices of my large stock of second-hand hives and double nuclei boxes, which I will sell very cheap; hives as good as new. Order soon. Address ADIN A. SMITH, St. Johnsville, Mont. Co., N. Y. 5fd

Dadant's Foundation Factory, wholesale and retail. See advertisement in another column. 3btfd

Vol. XII.

MAR. 15, 1884.

No. 6.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

KINDNESS TO DUMB ANIMALS.

PROF. COOK TALKS TO THE JUVENILES A LITTLE.

ON page 203 our friends will notice an inquiry from one of our ten-year-old juveniles. As soon as the matter was in print, I sent a proof to friend Cook, and for once in my life I did a wise thing. After you read the following, see if you do not agree with me:

Friend Root:—Thanks for the kind compliment you pay me in the note. You know, the merciful man is merciful to his beast, and the boatitude reads thus: "Blessed are the merciful, for they shall obtain mercy." I like the following, which has clung to my memory since I first read it in boyhood. Referring to our dumb animals, the stanza runs thus:

And if to us, one precious thing
Not theirs—a soul—is given,
Kindness to them will be a wing
To bear it up to heaven.

You know, friend Root, that a gram (to change to our modern measure) of prevention is worth a kilogram of cure. Now, I commence to train my calves and colts to milk and be driven kindly, as soon as they are born. If from the very dawn of their existence they are treated as less-gifted brothers—all the more kindly *because* less gifted, they will fairly blush at the thought of refusing any thing we may ask, or resenting any treatment we may offer, as maturity comes on. Will the juvenile readers of GLEANINGS laugh when I tell them that, a few years ago, having to drive a mare with her young foal—the latter highly bred and spirited—too far for the strength of the latter, I picked it up and took it with my own

two children right with me in my carriage? Twice that day I lifted the wee thing out to nurse, and then again into the carriage. How grateful the little thing looked! I have my own notion that the act has never been forgotten by that colt. The other day, when I first drove that same colt, it went so well, and looked so wise, that I could not but think the dear little thing was all the time cogitating as to how it could best please me. Talk of its kicking! That is a fruit that never grows on such treatment as my colt has always received.

My Jerseys are spirited, and full of life; but we commence our playspells as soon as they are well righted up, so that my Jersey cow, as I milk her, will fondle me with all the show of affection and thankfulness of a true friend, which I think she is.

So, Brother Root, you see I have had no experience in breaking unruly animals. The treatment I give makes it unnecessary. Had I such a one, I should expect that good oats, corn, and abundant caresses, would change the bad heart, which, by petting and handling, should have been kept right from the start.

I am sure that animals should be kindly treated and petted from birth. This doeth the owner good, like medicine; will be appreciated by the animal, and will make it perfectly docile and tractable from the very first.

A. J. COOK.

Lansing, Michigan.

Friend Cook, you do not know how glad I am to get just such an article, and I suppose you will not object when I say that I feel *sure* that bees can be made gentle in just the same way. Of course, many things are to be

taken into consideration, and we are to study carefully the habits and disposition of the little insects. But I know I have made cross bees easy to handle, by managing just right; and although there have been sometimes unkind words said in regard to our metal corners, for me they are absolutely indispensable for handling cross hybrids, and teaching them to be gentle. I have before mentioned, that my brother, M. S. Root, of San Diego, Cal., is president of the society there for the prevention of cruelty to animals, and it makes my heart bound when I think that there is a great organization in our land to this end, and that they are doing a great amount of good. When you have love in your heart for your cows and horses,—such a love that makes it a privilege to minister to their wants,—very soon you will find a love has grown in them also, and they, too, will soon think it a pleasure and a privilege to do your bidding. Oh that all mankind could learn this! I do believe, friend Cook, that that little colt was actually “cogitating” in his mind how best he might please you, for you have been his best and kindest friend so far back as he, with his poor little “horse sense,” can remember. Another thought: Knowing your dear children as I do, I can readily imagine their delight in being permitted to have the colt in the carriage as one of them. May God help us to remember these dumb brutes are HIS creatures!

THE FLOOD.

FRIEND DYKE'S LETTER.

NOT Noah's flood, but the great flood of modern times. The residents of the Ohio Valley have seen hard times during the past three weeks, and there will be much suffering and destitution for months to come. The river at this point began rising on Monday, Feb. 4, and on the following Thursday it had invaded nearly all the business houses of Pomeroy. It still continued to rise until Monday, Feb. 11, when it ceased. The water then stood 7 ft. 5 in. above the mark of last February, which was considered the highest water we had known since 1832.

This is a mining town, and many of the mines are flooded, and it is estimated it will take from six to eight months to pump them dry. In the meantime, one-third of our laboring population depends upon mining for a livelihood, and will hence be without means or work. A great many buildings floated from their foundations, some going away and others total wrecks. The call for relief met with prompt attention, and we do not know of any who have suffered. My shop was flooded to the ceiling, and my loss amounts to considerable in material, etc.

BEE-KEEPING

In the ascendancy, in spite of the warnings of W. Z. H., Heddon, and others. We have some very successful farmers who take a lively interest in bee culture.

CLIMBING BEE-TREES

Is spoken of by one of your juveniles in GLEANINGS for Feb. 15. Perhaps a little account of mine will be interesting in this connection. In June, 1878, I put a very large swarm of hybrids into an L. hive, but did not shade. They remained all right for several days; but in about a week they swarmed in my absence. My wife tried to settle them, but they re-

fused to cluster, and made directly for a tall poplar-tree about 100 yards distant, the top of which they entered. I left them alone until August, when I took a notion to see if I could not save the swarm. So I climbed the tree, took up a rope to get down by, and draw up tools, etc., and first smoked the bees out of the comb, then cut the top off, which was about 15 inches in diameter, and 60 feet from the ground. It fell to the ground, carrying with it bees and honey. The bees would not come clear out of the hollow, but went into the upper part of it above the comb, so that I was able to save them; but the honey was in bad shape. The top came near taking me along. I have often thought of my escape since, and have never felt desirous of trying such an operation again. The tree was a valuable one, and I could not get the privilege of cutting it down.

THE REWARD FOR AN IMPROVEMENT IN CHAFF HIVES.

Do you still offer a reward to the one who will invent that chaff hive, of which both stories will be the same? I have an idea it is possible. It certainly would be a great improvement, if we could have a hive that would admit of hanging the frames of both stories the same way. I know I should like such a one better than the other way. S. A. DYKE.

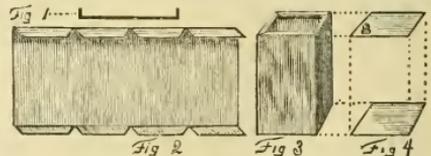

Pomeroy, Ohio, Feb. 25, 1884.

There is no standing offer that I know of friend D., for that desirable feature for chaff hives; but I am willing to pay anybody who will give me an idea that would be as simple as the chaff hive in its present form, and yet admit of taking out lower frames without removing all, or nearly all, of the upper ones. Perhaps this reversible frame which is now being considered may solve the problem.

HOW TO MAKE SQUARE HONEY-CANS.

FULL DIRECTIONS SO PLAINLY GIVEN THAT ONE WHO IS NOT A TINNER CAN, WITH THE AID OF OUR SOLDERING IMPLEMENTS, MAKE THEM.

FOR 10-lb. cans, take a sheet of tin $9\frac{1}{4} \times 20$ in.; fold both edges of the 20-in. way $\frac{1}{4}$ inch at right angles, so it will look like Fig. 1, when looking

at it endwise. Now snip out 4 notches in the folded edges, Fig. 2, 4 15-16 inches apart; measure from the same end for both edges. Now fold it up; have the folded edges come on the inside. The ends lap $\frac{1}{4}$ inch. Solder them together from the outside, and you will have a can like Fig. 3, without top or bottom. Cut two pieces $4\frac{1}{2} \times 1\frac{1}{2}$ inches; in one piece punch an inch hole near one corner for screw cap; solder the piece with hole in first; let the folded edge of the can come on the outside of the piece, and solder, and you have got the top. You can hold the bottom to its place while soldering, by putting a stick up through the inch hole in the top. Now solder on your screw cap, and you will have a square can that will hold 10 lbs. of honey, costing about six or seven cents. Any boy can make them; and with a little pains they look nice. W. W. TURNER.

Oak Hill, Greene Co., N. Y., Nov. 24, 1883.

OUR FRIEND D. A. JONES.

THE GREAT CANADIAN BEE-MAN.

FOR some time many of the friends have been asking for pictures of noted beemen, and many have wanted to know why they were stopped so suddenly. Well, friends, the reason is, I think, that they won't send me their pictures. I asked Doolittle for his, and he said he had not time to get one taken. Others had their excuses, and finally I got discouraged. Friend Jones, however, has finally let me have his, for I asked for it a second time, and here he is.

D. A. JONES, BEE-TON, ONTARIO, CANADA.

So much has been said about friend Jones already, that it seems almost idle for me to attempt any sort of history or biography. He is a whole-souled, good-natured kind of man, who generally does as he pleases. If folks don't like it they can go somewhere else. He sometimes runs against people's prejudices; and where they go through the world with sharp corners sticking out, as it were, friend Jones might give them a brush occasionally. There may be times when friend Jones is not courteous, but I have never yet seen such a time. When you want any assistance he is always ready, and will do for you all in his power. But where he has a great amount of business on hand, he has sometimes a sort of off-hand way of giving replies that many people might consider reckless; and if you should be inclined to take him to task for his small discrepancies, especially if you did it in a fault-finding sort of way, very likely he wouldn't trouble himself much about it. I do not know but I admire this very trait in him. One must know him altogether to appreciate the greatness of his character. I say *greatness*, for he is one of nature's noblemen. The way in which he has labored for the good of the bee-keeping world, and especially for the bee-keepers who live here in the States, where he can have but little hope of reaping a reward in the shape of any thing he might

have to sell, to offset the time and trouble he takes, is really wonderful. Although I know pretty well in regard to what people call his faults and failings, after having studied him well I feel the more sure that there are few in the world like him. He is emphatically a man who loves his fellow-men, and who loves to do mankind a service; and under the term "mankind" he would include all men and all nations. Mr. Jones has an unusual perception of the ridiculous in this world, as well as of the sublime, and it were almost worth a lengthy trip to see him in his happy way take off occasionally some of the laughable things that we oftentimes meet in this world of ours. I hardly need say that he holds, and has all his life held, a warm place in the hearts of his countrymen; and I am glad to see, as the years pass on, that he is getting to be esteemed by bee-keepers in the same way almost the world over.

TWO SYSTEMS OF SURPLUSAGE.

SOMETHING GOOD FROM FRIEND HUTCHINSON ON THE SUBJECT.

SINCE the invention of section honey-boxes there have been in use two systems of surplusage; the case, or crate method, and the wide-frame system. Nearly all of the crates, or cases, have been more or less complicated; some had movable bottom-boards, others movable sides; and in others, the sections were held in place or clamped together by wedges or wires; hence the more simple wide-frame system was very generally adopted. The greater adaptability of the wide frames to the employment of separators is probably one reason why that system has been so popular; but recent developments, however, have demonstrated that, if certain conditions are complied with, separators are not needed. This fact, combined with the late improvement in cases, has led many bee-keepers to discuss the advisability of discarding their wide frames for the improved cases.

Briefly stated, the objections to the wide-frame system are as follows: *Both edges of each piece composing the sections are propolized where the sections touch each other or the sides of the frame; the difficulty of removing the sections when filled; an upper story filled with wide frames the same size as the regular brood-frames is too much room to give at one time in the surplus department; the lower tier of sections being finished first, and becoming travel-stained before the upper tier is completed. With the tiering-up method allowed by the case system, these two troubles are entirely avoided; but with wide frames containing two tiers of sections, travel-stained honey is usually the result, unless the sections are looked over quite often, and removed as soon as finished. Of course, wide frames only one tier of sections high can be used; but the method of manipulating them is necessarily more complicated. Wide frames also admit of side-storing; but how much more simple and better it is to annihilate this side space; make the hive so small (not more than eight frames, and I am not certain that six would not be better) that an ordinary queen would keep it full of brood; then if honey is brought in, it must be carried up stairs. As Prof. Hasbrouck says in his article, "Bee-power or Man-power,*

Which?" "Bees are the cheapest help to lift honey from the lower story to the upper." This article of the professor's is in the January No. of the *American Apiculturist*; and although I am wandering from the subject, I wish to say that I consider this article as the best of all the good things that friend H. has ever written; and I wish, friend Root, that you would copy it, even if you have to leave out—well, some of my own articles.

Last winter, when I visited friend Heddon, I was prejudiced (if that is the word) against the raising of comb honey. I had tried the wide frames, those the same size as the regular brood-frames, and those containing only one tier of sections; I had also tried different kinds of crates or cases, but I had laid all aside for the more simple, and, to me, more profitable extractor. When I saw friend Heddon's case, hive, honey-board, etc., I was very favorably impressed; and, as he says, I scanned closely, and asked many questions, until at last the whole arrangement so appealed to my reason that, although I had nearly a hundred Simplicity hives with American frames, I decided to lay them aside for the Langstroth frame and friend Heddon's case, hive, and surplus arrangements, and make a specialty of comb honey. I did so, and the experience of even the poor season of 1883 confirmed me in the belief that I made a wise decision.

In a back number of GLEANINGS a correspondent remarks, that wide frames are "doomed;" and in reply, you, friend Root, say that you had not yet heard of it. Now, if you could read the letters that I receive since the apiarian world has become aware that I am using the Heddon case, I think you would begin to think that wide frames are at least *going to be* "doomed." The following is a fair sample of the inquiries that I receive:

STEDMAN, N. Y., Jan. 23, 1884.

W. Z. Hutchinson:—Will you be so kind as to answer the following questions?

1. What kind of a rest is used for the sections in the Heddon case?
2. Is the Heddon case taken to pieces to remove the sections?
3. Could the half-story Simplicities, as figured on pages 226 and 284, Vol. X., GLEANINGS, be arranged to answer the same as the Heddon case?
4. Do you think Mr. Root's exceptions to the above articles are well taken?

L. D. GALE.

From an experience of one season, with 150 Heddon cases, I will, with your permission, answer the above.

1. To the bottom of each division-board in the case is tacked a strip of tin, one-fourth of an inch wider than the boards are thick; the edges of the tin thus project one-eighth of an inch, and furnish a support for the sections.

2. No: the Heddon case is *not* taken to pieces; the sections being removed as follows. The case is inverted $4\frac{1}{2}$ inches above a bench or table, and supported at each end. A piece of 4 x 4 scantling, one-half inch shorter than the width of the case, inside measurement, is laid upon one row of sections, and both hands brought down upon it "ker slap." The sections of this row are thus loosened and started, all at the same time, upon a *sliding* journey downward, the block and the hands involuntarily following. As the sections alight fairly and squarely upon their feet, so to speak, they sustain no injury. The block is drawn up by inserting the fingers in holes bored in the upper side, and placed upon the next row, and that "slapped" out, and so on and so forth, until all are out. In order that no pressure be

brought to bear upon the center of the bottom-bars of the sections, the block of wood is hollowed out along the center of its under side. The same result can be obtained by tacking small strips of wood to the outer edge of the lower side. I can not help wondering if friend Miller adopted this method of removing the sections (I *presume* he did), and if so, *why* he succeeded no better. Friend M., if you don't succeed any better another season, I shall be tempted to come out to your place, and show you how to remove the whole 28 sections—well, *almost* as soon as you can remove the first section from a wide frame. In removing our 2800 lbs. of honey last season, my brother and myself did not break more than half a dozen combs, and those were only partly finished ones; and the lot of honey in which they were had been left in the cases off the hives, during a cool night near the close of the season, and I attempted to remove them early in the morning.

3. No: not unless smaller sections were used, as the divisions would occupy some room.

4. In my opinion, some of them are exceedingly well taken, others are not; but to review those two articles and the editorial comments, and do the subject justice, would make this article too long, hence must be deferred until the next time I write.

Just one word of caution or advice: To get a perfect idea of the Heddon system, one should not only *see* the case for holding the sections, but the hive and honey-board, as each is complementary to the others, and a slight mistake might change success to failure.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., March, 1884.

Friend H., it seems to me there is some misconception or misunderstanding among us. The first objection you mention to the wide frame is, that the sections get covered with propolis where those in the cases do not. I can not understand you here, unless you have used your wide frames separated a little from each other, as you use the brood-frames. If the wide frames are close together, and wedged up, as we always intend to have them used, it seems to me they are the best protection against propolis of any system. With Heddon's arrangement, as you state it, I should suppose the bees had access to the bottom-pieces of the section, unless friend H. uses a honey-board made of slats to prevent this; and in that case it seems to me the division-boards occupy space unnecessarily. The plan you give for removing sections will answer as well for wide frames with a little different follower to crowd them out all at once. I think friend Miller once told us about this. At Toronto I saw them removing sections from all sorts of cases and wide frames, by a follower that pushed out the whole set at once. My argument in favor of cases would be, that they are cheaper than wide frames. Of course, we can dispense with separators with wide frames, as well as with cases. You may be right about a hive made so narrow as to hold 8 frames, or even 6, yet it seems to me during a heavy yield of honey the bees would work in boxes put at the side of the hive, about as fast as they would work in those on top, and that a much larger amount of honey would be secured by having sections at the side, as well as above the brood-combs, especially where the hive is contracted to 8 or 6 frames. The great results obtained by

Jasper Hazen, Mrs. Cotton, and Mr. Quinby, are, if I am correct, secured by having honey-boxes completely surrounding the brood-nest. Now, when we have a powerful colony and a wonderful yield of honey, I am pretty sure this arrangement will give a larger crop than can possibly be obtained with surplus arrangements only, above the brood-nest. Of course, Doolittle would agree to this, and I should be very glad indeed to have the opinion of Capt. Hetherington and L. C. Root in the matter, as they doubtless use side-storing boxes, and I know they have tested all these things pretty thoroughly.

“WE BE BRETHREN.”

BEE CULTURE IN THE DARK (?) AGES.

WHILE considering a prominent point in our Home Papers for this month, the following was received from one of our bee-men, which he says was clipped from the *Statesman*, of Concord, N. H.:

WRITING ABOUT BEES.

The honey-bee has been the subject of curiosity for ages, and many books have been written about them. Virgil in his day gave to the world some very absurd ideas, and the more we read about bees, the more we are convinced that much penned is mere nonsense. It would take a lengthy article to put down all our doubts respecting the theories advanced by different writers. We will run over a few. We want more evidence to induce us to believe that the “queen,” so called, is a queen, a real female, and that the drones are all males. The opposite would harmonize to the general principles of nature. We can't help thinking that the queen is a king; that the working bees are also males, and that the drones are females. This would balance the community much more in accordance with nature's laws, as displayed in all gregarious animals. Again, we call for more evidence to convince us that the killing of drones by the workers in the fall is a matter of malice or calculation. Question: Do not the drones begin to die off, as many other species of insects do, after having laid their eggs for new swarms? The females, dying, are thrown out as useless or foreign matter, and in their hurry to clear the hive, many are helped out while living.

What about bees' eggs? Who ever saw them? We think they are viviparous, or as nearly so as some flies. More facts and less guessing would put the bee business into a more reliable shape. And on the subject of hives, what lots of hives are presented to the public, all the best! The most of them are merely gotten up by Yankee speculators, who fleece the farmers out of five or ten dollars for one that is not one whit better than a flour-barrel. Bees put in them linger one or two years and die off, and the hive and its wonders are thrown among the old rubbish. The old box hive was good enough for years, and bees did well; but in this age of progress, bees, to keep up with the times, must have new hives with as much machinery as a cooking-stove, and the bees just come out of them and go for the woods and select one of nature's hives, a hollow tree, and there store up their sweets, and are happy.

Tuftonborough. J. L. HERSEY.

As the above article was warmly commended by the agricultural editor of the above it would seem that he, too, didn't see any thing wrong about it. The thought I would call attention to is this: The sad want of charity shown by the writer. Does he think that bee-men are working and talking and writing about something of which they know nothing? that they are blind leaders of the blind? or are they really brethren, who, like himself, are honestly and earnestly striving for truth? Again, why did he not, before writing about bees, go and see some genuine bee-man, and find out, by using his

own eyes, whether “these things are so”? He innocently asks the question, “What about bees' eggs? who ever saw them?” I wonder if it is indeed true, that we are as uncharitable and as foolishly ignorant about other people's industries as the world seems to be of our own. If so, it is a burning shame and a disgrace to this 19th century, that we should be so shockingly *innocent* of what is going on in the world; and, saddest of all, so contracted and narrow (I am taking a part of it myself, dear friends) that we can not open our hearts and take in the great thought that “we be brethren;” and as brethren, are seeking alike for truth and wisdom, and looking upward toward the great Father over us all. Let us have still more fairs, conventions, and expositions, and let us get Bro. Hersey and take him along.

THE REASON WHY HONEY DOES NOT SELL.

BY MRS. L. HARRISON.

I HAVE always been surprised at the low price bee-keepers were willing to take for their extracted honey. My partner formerly opposed its production, saying that honey lost its flavor, when not sealed up in the comb. When I was in attendance at the National Convention at Cincinnati during the fall of 1880, I purchased a pound jar of Muth's extracted honey, and took it home with me. I heard my partner say, while eating some of it, “How very nice it is!”

During the convening of the convention at Lexington, Ky., in 1881, the ladies in attendance, and a goodly number of gentlemen, were entertained in a princely manner at the residence of Mr. Williamson. Upon their table, at different times, was a bowl of extracted honey, the like of which we had then never seen equaled, and rarely since. It was white clover, of delicate flavor, very light and thick. Ever since then we have been asking Lucinda Harrison why she could not produce honey like Mr. Williamson's, and last spring we told her she had *got* to do it. So after white clover was fairly under way, the honey was extracted from some combs, and given to the bees to be filled with white clover, and nothing else. The result was very gratifying. Whenever I wish to sell any of that honey, I select a person whom I judge would be a good customer, and give him a jelly-cup as a sample, wasting no words, merely saying, “Will you please try a sample of our extracted honey?” The proof of the pudding is in the eating; and when we have a customer, no one need “poach on our preserve,” for it will do no good; he is ours, as long as we have a supply. This honey we sold at 15 cents per pound, while choice white clover, in pound sections, was retailing at two pounds for 35 cents. Buyers furnished jars or buckets, and it was delivered to them in liquid form, ten, twenty, or thirty pounds at a time. It seems as though retailing half-pound sections was very little business, compared to this.

Last fall I inquired of a groceryman if he wanted to purchase honey. His reply was, “Oh, no! I've six buckets I bought two years ago.” I requested to see them, and found that he had tin buckets holding five pounds apiece, and had sold only a very little out of one. It was not very nice. Another dealer said he would as soon sell “soap-grease” as a neighbor apiarist's honey.

A farmer who has fifty colonies of bees, and runs them for extracted honey, sells all the product to his neighbors, and could sell more if he had it. He does not go out of his gate to do it, either. They come with their pails and jars, and carry it home with them. By the way, this farmer's wife can talk, and work as well. There is not a bee-keeper in the land capable of estimating the demand of his home market until he develops it. MRS. L. HARRISON.

P. S.—Dear Brother Root, I thought you had seen the error of your ways as to the wrong of selling honey mixed with glucose; but on reading your comments on the way Thurbers do it, I feel as though we would have to have a day of fasting and prayer over you yet. If you will tell me where I can buy some corn syrup, free from any poisonous acid, you will oblige me very much indeed—such syrup as the mother of little Huber is willing to give him day after day, for instance, as freely as mothers used to give their little ones New Orleans molasses.

Peoria, Ill.

L. H.

Now, Mrs. H., I am not nearly so bad as you think I am. I only proposed selling corn syrup, or glucose, to anybody who wanted it, labeled with his own name. Then you know the manufacturers would have an opportunity to dispose of it through a legitimate channel. I do not know where I can get any corn syrup such as Mrs. R. would be

willing to feed little Huber. By the way, Huber likes honey immensely. It is just fun to see him smack his lips over some that is good. Well, a few days ago a friend sent us a sample of honey to taste. The color was good, and it was very thick; so I took it down to the lunch-room and put it on our family table; and without thinking to taste it myself, I gave Huber a good taste of it. To my great surprise, he didn't smack his lips nor act pleased, and I could not think what the matter was until I tasted it myself. What do you think? Why, it was some bitter honey that somebody down South had sent, and the poor little chap could not see the point, and so he wisely kept still and said nothing. By the way, I want to add emphasis to the point you bring out, Mrs. H., that clover honey, to bring a good price readily, must be pure, and free from the slightest taint such as any old honey remaining in the combs over winter would be likely to give it. Either give the bees a new set of combs when clover blossoms, or else extract all the old honey, and put it away by itself, then let the pure clover get thoroughly ripened by putting on two stories, or more if need be; then extract it, put it into clean tin buckets, and you can make a market just as you tell about doing, every time.

HONEY-JARS.

SHALL WE PUT OUR HONEY IN GLASS OR TIN?

WHILE friend Jones has been working so earnestly in devising tin pails and boxes for retailing honey, our stalwart and solid friend, C. F. Muth, has been sticking closely to the Muth honey-jars, which are known almost the world over. For years we have had one and two pound jars in the market, but now friend Muth gives us his half-pound, and a still smaller one, which he calls his "Dime" jar. This dime jar is to be sold full of honey for an even 10 cents; and it has the advantage over our dime tin boxes or dime jelly-tumblers, that it can be packed and shipped safely. The dime jar holds about five ounces. Price of these is \$3.25 per gross, shipped from Cincinnati, which would be a little over two cents each. Corks and labels would make them toward three cents each. Counting the five ounces of honey worth five cents,

(putting the honey at 16 cts. per lb., for such small quanti-

ties), your dime jar would cost you eight cents, allowing two cents profit to the retailer. One great trouble with honey in glass is its candying property; but as a great many like it best in a candied state, this offsets a part of the objection. Another is, that these small jars may be very quickly melted by setting them on a thin board laid on the stove where it is not very hot.

SMILERY AND BLASTED HOPES.

BOTH SIDES.

FRIEND ROOT:—I commenced three years ago with two nuclei of Cyprians, and have now 40 colonies of hybrids, all strong and vigorous, as their active house-cleaning, some days since, demonstrated. Lost none. All well supplied with stores. The cap is roof-shaped, thoroughly water-proof, with a space above the frames, averaging $2\frac{1}{2}$ in. filled with dry leaves. Two short sticks lie across the frames, under the enameled cloth, so that the bees can cross over. With the mercury for a long time below zero, and at one time more than 30 degrees, they remained all right. As they have an incomprehensible method of making wax out of honey, and of reducing sweet water otherwise than by evaporation, so, also, they have a process, unknown to man, by which heat is generated, amply sufficient for all emergencies. The study of their wonderful and incomprehensible performances is extremely entertaining, to say nothing about the fun of hiving, taking out sections, extracting, etc.

The yield of honey last season was large, but alas! I have still the most of it on hand, and this takes me out of the "Smilery" over into the other place. The honey market here is hopelessly glutted. My merchant in Kahoka occasionally sells a few pounds for me, and we occasionally sell a little at home. Price, comb honey, 10 cts.; extracted, $6\frac{1}{4}$ cts. Hence the outlook for profit is extremely gloomy, and I should be in a sorry plight had I to rely exclusively upon this business for a living. I would say to all who contemplate making it a specialty, *don't*.

I thought for a time that, when honey ceased to be a luxury, by reason of the reduction of the price, a taste for it would be cultivated by the masses; and in this I was mistaken. *The more of it used, the less it is desired.* Its rank and pungent taste soon cloy upon the palate. My family liked it much at first, but it now remains upon the table, and is seldom touched. Honey is used for many purposes, and doubtless in the future will have a certain market, but the figures will be low. Its actual value consists in the saccharine matter it contains. Take a lot of honey and analyze it. It contains so much grape sugar, so much manna, a certain amount of mucilage, and also pollen, acid, and other substances and juices. Now, the only thing about it of actual value is the grape sugar, and that is so tangled up with other things as, doubtless, to impair its value for some purposes. As an article of diet, though the manna itself may be "both a food and medicine," and the pungent vegetable extracts may have "rare virtues," yet it is useless to close our eyes to the fact that the American people eat, not for health, but for satisfaction. C. S. CALLIHAN.

Jem, Mo., Feb. 12, 1884.

Friend C., your article is certainly frank and fair, yet I am inclined to think you rather underrate the value of honey for food; and I believe your market can be worked up to a better state than you represent it, if your honey is of good quality. Last month I spoke about the basswood honey in the comb being better than our extracted honey. A few days afterward, a bee-keeper offered me about 1000 lbs. of nice basswood honey at 8 cts. per lb. He got a little discouraged in trying to sell it, and so offered it low. A sample of it was put on the table in the

lunch-room, and I asked how many would take some of it at 10 cts. per lb. It was ordered rapidly, and for the past ten days we have been doing the nicest retail trade in honey I ever knew. I put an advertisement in our two county papers, as follows:

HONEY FOR ONLY 10 CENTS PER LB.

Until further notice we will furnish our best quality of extracted honey, either white clover or basswood for an even 10 cents. Bring on your pitchers or pails and get them filled. Or we can furnish you neat and pretty packages of any size you wish, holding from $\frac{1}{2}$ to 100 lbs., at very reasonable prices. Now is the time to lay in a supply, for good honey will keep a hundred years, if you want to keep it so long. Nice comb honey at from 15 to 20 cts. per lb.

A. I. ROOT, Medina, O.

The very next morning, people came flocking in with pitchers, tin pails, and all sorts of utensils, and we have had a steady trade ever since, and Mrs. Shane informed me that the 1000 lbs. would soon be gone, at the rate it was going. Two cents per pound profit is not much, it is true; but as a great part of it was sold in 10 to 25 lb. lots, it was a pretty fair business after all. The secret of it is, the honey was sweet and pure and well ripened; it was never in barrels at all, and had no taste of barrel-staves about it. With a pitcher of milk, and some nice bread and butter, I could eat it three times a day, and feel happy too. Now, is your honey really good, thick, and kept in tin, so it has no unpleasant flavor, and have you got a honey market worked up on it? I want to see you not only smile when you work with the bees, but when you hand the honey over to your friends and neighbors during the winter, friend C.

OUTDOOR WINTERING.

POLLEN NOT NECESSARILY A CAUSE OF DYSENTERY.

AS you well know, I have been for years an advocate of outdoor wintering, and for the reason that I have been invariably successful in wintering my bees on their summer stands. This winter, that has been unusually severe, is no exception with me, as to-day I opened my hives and found every colony in good shape, with a large amount of brood, and very few dead bees.

The winter, I said, had been unusually severe; and when I inform you that for some eleven weeks the thermometer went no higher than 22° above zero, and for a number of days it ranged from 6° to 18° below, you can well believe I assert nothing more than the truth. My colonies are nearly all in Simplicity-Langstroth hives, containing 7 and 8 frames of comb, with division-boards on each side. I found the combs all dry, and without a particle of mold, showing that no moisture had condensed, and therefore there was no chance for ice to form inside the hive. But little honey had been consumed, owing, I suppose, to the extreme cold, which caused the bees to assume and keep in a semi-dormant state. Although the bees were flying freely, there was no spotting of hives or the little snow upon the ground, and this notwithstanding I left a large amount of pollen in the frames for the purpose of testing the pollen theory. I am more fully convinced than ever, that pollen alone does not cause bee-diarrhoea, or dysentery, so called (whether it is a factor in so doing in connection with other things I know not), and that we must look further still for the cause of that pe-

cellular plague of the apiary. I am also convinced that we must have a light warm porous covering over the frames; and as forest-leaves have proved a success in every instance with me, I shall stick to it that there is nothing better.

I do not believe in upward ventilation to the extent of causing a direct draft through the hive, but consider it indispensable for outdoor wintering, to allow a chance for excess of moisture to pass off imperceptibly from the tops of the frames. I consider the Hill device, or some substitute therefor, that will allow at least $\frac{3}{4}$ inch space above the frames for the bees to cluster in, and allow them to intercommunicate with every frame in the hive safely, indispensable also. A good strong colony, packed in 6 or 7 frames, L. size, with upper half full of scale honey, a Hill device over the frames, covered with a porous mat, with 6 inches of forest-leaves poured lightly into the upper story, and entrance contracted to about $1\frac{1}{2}$ to 2 inches, will, I firmly believe, withstand the severe cold of any Northern winter, on summer stands, and come out bright, strong, and healthy, in the spring; at least, such has been the case with myself for years, and I have no more fear of winter, so far as losses are concerned, than I have of any other season of the year. Perhaps as many say, the L. frame is too shallow for winter use; but I find in practice that my bees winter well on it, and what more can be desired?

Foxboro, Mass., Feb. 25, 1884. J. E. POND, JR.

We have wintered just about as you describe, friend P. Although we use chaff hives, I have, like yourself, been so far successful. I, too, am satisfied that pollen does not necessarily cause dysentery, although I believe I would a little prefer our colonies should go into winter without any, if I could have them thus. The Hill device (or some equivalent) and a porous covering seems to be the great important thing. We should remember, however, that bees have generally passed through this severe winter well.

UPS AND DOWNS OF BEE-KEEPING.

THE THORNS AND ROSES OF APICULTURE.

MY father-in-law gave me a swarm of hybrid bees in the spring of 1878. That begins at the commencement, so far as practical experience is concerned, with us. We quit the season with 7 swarms of bees and 5 gallons of honey. First winter, put bees in cellar; lost 3 swarms by May 1, 1879, so we had 4 left to work on; quit the season of 1879 with 18 swarms and a barrel of nice honey. We were in earnest. We made us a hay house, and packed our bees away in sawdust, but, alas! by spring they had all turned up their toes. We could have folded our hands, and said the business was a failure; but we had learned the lesson of the old adage, that eternal vigilance is the price of liberty, and that it was applicable to the success of any thing that is good; so in April, 1881, I sent to you for a nucleus of pure bloods, and ordered them sent at once. The 20th day of June they arrived in Logan. Of course, all I could do that season was to build them up into a good strong colony, and let them remain on summer stands all winter. In the spring of 1882 they were strong and nice. I quit the season with 7 swarms of bees and 22 gallons of honey; put our bees away in an old open house; came out last

spring with 4, only one of them in first-class condition; quit the season with 8 swarms, after selling 4 at \$10.00 apiece, and 65 gallons of honey.

DOES IT PAY TO KEEP BEES IN CONNECTION WITH OTHER BUSINESS?

Now, friend Root, Mrs. P. has had almost the entire control of the apiary for the last 2 years; she has 5 children to look after, and no help whatever, except what she gets out of them. I keep no hired help, preferring to do my own work that is necessary to run 160 acres of land, excepting a little in harvesting and haying. Since there is considerable being said just now about who shall keep bees, I thought I would tell what I think about it, and that is this: That any one with good natural sense and plenty of spunk, and who reads the journals, can, with little expense, have all the nice honey they can possibly use, and sell enough to pay expenses.

H. V. PECKENPAUGH.

Reeder's Mills, Harrison Co., Ia., Feb. 25, 1884.

DIPPING WAX SHEETS.

A METHOD SUGGESTED FOR GETTING SHEETS OF AN EQUAL THICKNESS AT ONE DIPPING.

USE a kind of dipping-board for sheeting wax, different from any I have ever seen described, which I think would be appreciated by those who, like myself, make their own foundation, and have to rig up the necessary apparatus as cheaply as possible. It requires no special dipping-tank—a common wash-boiler answering perfectly—and the wax can be used off until it is only an inch, or even less, deep on the surface of the water (which is used to fill up with). The board consists of a disc of galvanized iron, of the required dimensions, bent in the form of a half-cylinder, to which is attached a handle at each end, by means of wires soldered to each corner of the disc, as shown in the drawing. These

LIVINGSTON'S DEVICE FOR DIPPING PLAIN WAX SHEETS.

wires should be about No. 14, brass or steel, spring wire. To operate it, I take a handle in each hand, and give it a rotary motion (which takes a little practice to do properly) first through a very thin flour paste, then through the melted wax as often as desired, reversing the motion if dipped twice, so that the sheets will be of an even thickness, then dip into cold water, and peel the sheets off. I have used this method two seasons, and consider it in every respect satisfactory.

T. W. LIVINGSTON.

Ainsworth, Iowa, Jan. 28, 1884.

Many of our readers know, I presume, that we for years used sheeting plates made of galvanized iron. We abandoned them, however, for the wooden dipping-boards we now use, because the wood holds the water so much better than the iron. With the wood, however, we do not get an even thickness, even though we reverse the sheet, putting in first one end and then the other. The plan given above might be valuable for making sheets of an exact size, like those used by the Given press, for instance.

MRS. AXTELL'S REPORT FOR THE SEASON OF 1883.

Another Successful Honey Season.

ALSO SOME CAUTIONS IN REGARD TO DISPOSING OF A CROP OF HONEY.

WE began the spring of 1883 with about 184 fair colonies, after being doubled up, leaving about 50 very weak colonies, because of taking brood away to build up the others—only bees enough left to care for the queen until swarming-time; but care should be taken that they are not left too weak, as they will die. We had about 120 swarms, some of which were superseded; such were put back generally, and all the weak colonies built up with the brood the swarms came from. Every colony in the apiary should be made strong as fast as possible; yet wisdom should be used in building up nuclei and weak colonies, that more brood is not given them, than they can keep warm and feed, even in mid-summer. We have had brood lost in that way.

Late swarms and all second swarms were put back. From the 185 fair colonies, and 50 or 60 2-frame colonies, we increased to about 275 colonies, some of which were disposed of, and took about 15,000 lbs. of honey—1000 or more we are holding in reserve for spring feeding; 1800 was extracted honey, and the rest comb honey, making about 80 lbs. per good colony.

Had we not had strong colonies, our honey crop would have been short this year, as we had a good many empty brood-combs that we gave the swarms, so but little honey was used in building brood-combs.

Commission men used to tell us that they did not wish to haul the honey until the flies were nearly gone in the fall; but last summer they were willing to take it as soon as they could get it. We think it pays to get it on the market early, because then we have a longer time between seasons to sell it, and it looks nicer before cold weather. We had honey on the market in Chicago by the last of June. It did not bring so much per lb. as later in the season, because the fall crop was short.

BE CAREFUL TO WHOM YOU ENTRUST YOUR HONEY.

We came near losing about \$550 on our crop of the year before, sold by a commission merchant in Chicago. We could not induce him to make payments until it was about all sold. He then would keep the money and pay in small monthly payments, saying he was about broke up, and if we pushed him he could pay nothing at all, as his creditors would take all he had. He finally failed to pay what he had promised monthly, and tried to get Mr. Axtell to take his note, which Mr. A. thought would be worth nothing if he had nothing, and was advised to place it in the hands of a lawyer, R. E. Jenkins, 89 Madison street, who undertook the case, telling them they had committed a criminal act, and had laid themselves liable to punishment, in case they did not pay up promptly. They wrote to us begging leniency, but we referred them to our lawyer. We agreed to throw off about \$50 if they would pay the rest, which they did promptly. We felt we were favored in finding so good counsel, honest and straightforward in his proceedings, and would recommend him to others who might need counsel and help to collect their dues. He charged only \$30 for collecting the \$500; \$10 per \$100 is the usual price, I believe; but he being a Christian man, and we were

to give the money to foreign missions, he threw off \$20. Mr. Jenkins advised us never to take a note of a commission merchant, because that would prevent him being laid liable to punishment, if failing to pay when he uses the money for himself. It is a comfort to know there is such a law to protect farmers and bee-keepers and others in sales by commission, as it seems the only way to sell large crops. It is better to pay 10 cents on the dollar than to lose all, and it is well, too, to have some one we can trust to look after tardy commission men once in a while, to look in upon them and inquire after sales. I think he helped us in another case by simply asking after it. He made no charge for that.

We hardly think it best to make very large consignments of honey to anyone man, because it takes so long to get a settlement (if others' experience is like our own), and they change their firms so often, unless one could find a house that he or some of his acquaintances knew. The man who failed, and we came so near losing by, came to us as a member of the Mercantile Agency, and we were told if one of their members fails they agree to look after him and make him or help him to pay his debts; but I guess that is a mistake. He remarked to us that the Mercantile Agency knew nothing about his standing. They generally write us they would like to handle our whole crop, because they can do better by having all there is of a certain brand; but I don't believe it makes any difference as to that. If they have a large amount on hand, it takes a long time for them to get rid of it. If one could sell his honey outright at home, even at a lower price than they hear it is on the market, it would save considerable anxiety, and usually pay about as well.

Some seem to blame Mr. W. Z. Hutchinson for showing up the dark side of bee culture. No one can honestly deny but there is a dark side to it; but keep right ahead through both dark and the light, and success is sure to follow, especially if the *women folks* have a hand in looking after the bees, as their work pays as well as a man's work. As for a cure for dyspepsia, I know from experience there is no surer cure than bee-work for both the purse and the body; but I believe every one should have some other occupation linked with that of keeping bees, or else there will be years of suffering and disappointment, especially if one has a family to care for. I sympathize with such, rather than criticize them; but I would advise them to keep ahead, and not to lose the valuable knowledge already gained; put the children into the business, and make them helpers as fast as old enough, as Father Grimm used to do. Teach the girls to care for a few colonies, and put the honey into shape for market; and if there is an invalid in the family, carry his cot out among the bees, and let him watch the swarms; give him a queer-cage, and leave him there alone; and before he knows it, he will have flown around after the queen and the swarms, until dyspepsia and the other ills that flesh is heir to have for the time being disappeared. Invalids are just the ones of all others to keep bees, if they have kind and experienced friends who are willing to help when they need help, and are a little forehanded and can hire help; but above all, if they have the perseverance that can never say *fail*. Something depends upon the kind of hive we use. You all know I have been an invalid for many years. For 27 years I have kept my bed about three-fourths of the time, until I began bee culture, because I was an invalid. I could neither walk nor

lift but very little, and such is the case yet when I begin in the spring, as I always run down in the winter; but by having my girl always with me to take steps and do the light lifting (as there is no need of heavy lifting with our hive, as the sides are clamped together, and all parts, both top and bottom, are separate, and can be taken away, and combs left standing on the bottom-board), there need be no lifting of heavy hives; and if there are piles of unsealed honey on top, it does not need to be removed before you get into the brood-nest, but simply take off one side. I would strongly recommend the Quinby hive, holding about 10 brood-frames, for the use of ladies and invalids.

WHO SHOULD KEEP BEES?

The question is often asked through the journals, and answered, "Who should keep bees?" I should like to suggest that all Christians should, and give the half of the proceeds to home and foreign missions, and prove the Lord therewith, and see if they will not need to build larger houses to hold the honey. His promise is, if we will but bring in the tithes, that he will "open the windows of heaven, and pour us out such a blessing there will not be room to receive it." He is a promise-keeping God.

Friend Root, I was just reading that you sometimes sold GLEANINGS for waste paper; you did not like to give them away, because it would not be serving all alike. I should like to ask that you send a few numbers to Rev. S. R. Keam, of Caddo, Indian Territory, a very faithful and earnest missionary to the Choctaw Indians, and also a few to Rev. James Brewer, of Gladbrook, Iowa, who is father-in-law to Rev. Mr. Christy, of the Turkey mission. Sending to them would be *exceptions to the general rule*, as they both have a few colonies of bees, and would be very thankful for any such helps.

Those hymn-books your employes sent us went to Mr. Keam's Indian mission. I wish I had time and space to tell you of the great good he is doing, and of the help those books and hats sent him have been to him. He turns the hats into money, and uses it to help build Indian churches. Every little helps. He has four Sabbath-schools under his charge, and asks for Sabbath-school papers; asks for old ones, but of course new would be acceptable. He says he has his heart set on building two more log churches, and a parsonage for himself this next year, to save the A. H. M. Society paying rent for parsonage. He asks us to send him all the hats and bees we can, and he will do his best to convert them into money. Won't others help him too? Supt. Doe, of the A. H. M. society of the South-west, speaks very highly of him and his labors.

Roseville, Ill., Feb. 22, '84. MRS. L. C. AXTELL.

We are very glad indeed to know, my good friend, that you are still successful with the bees. But I must confess I had to smile pretty broadly when I got where you told about employing a lawyer to make your commission man come to time. So it is really true, that with all your zeal for Christian work and foreign missions, you at the same time think it right to go to law in order to save your property. I believe you are right, my good friend, but I am afraid some of our skeptical friends will think it a little queer to hear you talk of lawsuits and foreign missions almost in the same sentence. I do think there is great danger that we get into a way of going to law with neighbors, or perhaps fellow-Christians; though I feel satisfied, too, especially of late, that it is right

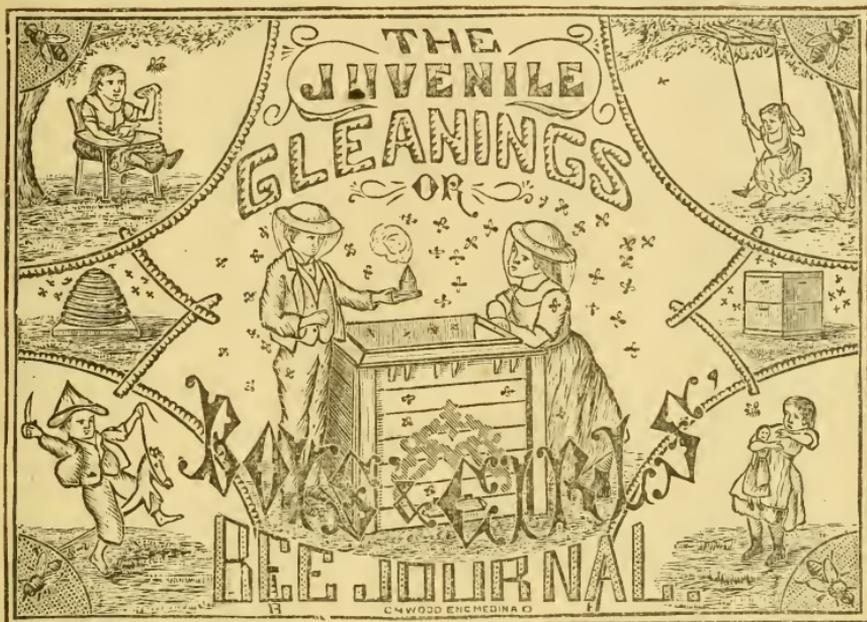

to *compel* unscrupulous, or even slack and heedless people, to pay us our just dues, though, of course, we should go about it with Christian kindness. I am glad to know of this point you mention in regard to the advantage we have in sending our honey to commission men. Will somebody tell us if this holds good in all the States? I confess that I should take a note, without thinking. And so, Mrs. A., you think all Christians should keep bees. While I am not quite prepared to indorse all that, I do most earnestly wish that all Christians would consecrate a part of their earnings to Christ's cause, and for the advancement of his work; and I do firmly believe that we should all be gainers instead of losers thereby.

DEPARTMENT FOR THOSE WHO SAY GOODS WERE NOT THERE.

THE comb starters that I missed are all right. My brothers were putting the frames together; and when they were putting the frames away they put part of a package of the starters away with them, instead of putting them into the box with the unfinished frames. Thus they were lost for a time, but are all right. *No mistake of yours.*
J. F. KERWIN.

Java, N. Y., Jan. 17, 1884.

You see, the friend above wrote us that we had not sent his starters. As soon as his letter was received, his correspondence had to be looked up, then a clerk hunted up the order for his fdm., and carried it back to the wax-room. After hindering several hands, as well as getting proof from the shipping clerk that the goods were certainly inclosed, we wrote back that he must be mistaken. The above card is the answer, if I am correct. Now, the moral is this: Do not let anybody else open your goods for you. Take your box on a clean bench or table, and then with invoice in hand go over each article. After you see that every thing is correct, then let your brothers or any other persons handle them all they please, and lay them around where they like. Another thing: Many business houses, as you know, print on the heads of their invoices, "No claim for damages or shortage allowed, unless made immediately on receipt of goods." I have often thought of doing so, but I disliked it, because it seemed hard. Those in the mercantile business very soon learn by sad experience the importance of inspecting and checking all goods before anybody can handle them. But I am afraid our bee-friends, many of them, have not yet learned this. In our establishment, sometimes new clerks think it pretty hard because I object to their touching a box of goods until the proper clerk has first inspected them, to see if they are all right. When I try to explain the matter, they smile at the idea that they are not capable of checking off a bill of merchandise. I have found that it takes a smart clerk to open goods and put them away, and not make mistakes. If you make an order yourself, you yourself ought to know whether you have got just what you ordered; but let another person undertake it, and there will almost always be misunderstandings.

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR?—LUKE 10: 29.

LAST month I talked something to you about avoiding quarrels and difficulties with your neighbors. I told you to try to be pleased with them, and not get into a fault-finding way. There is, however, another side to this matter, and a sad side, although perhaps our juvenile friends do not have much to do with it. We are sometimes obliged to be disobliging to our neighbors, and to give pain. You may wonder at this, children; but I think I can illustrate it to you. Several years ago Ernest had a little playmate of whom he thought a great deal. But this playmate would persist in swearing. I presume he had heard his father swear, and perhaps his mother had not been very vehement in rebuking him for swearing, so he got into a habit of swearing very badly. What should Ernest do? It was a pretty hard thing for the little fellow to do, but he did finally tell his little playmate that his mother said he must not play with him unless he stopped swearing. Now, Ernest enjoyed games as much as anybody, and he hated to seem uncourteous, or "stuck up," as some of the boys might express it. But he did drop their plays several times, and went home until his young playmate got so lonesome that he promised him not to swear any more, if he would come and play with him again.

As we grow older, we find hard and diffi-

cult things to do in this same line. I once promised, with four other men of our town, to make complaint of every case of drunkenness I saw on our streets; but when I gave the promise I spoke like this:

"My friends, it will be a hard thing for me to do, but I will do it on this condition: That I first go and see the man whom I find intoxicated, at his own home, and have a talk with him, when he is sober, and tell him what I have decided to do, in case he does not stop being seen on the streets in that condition."

Very soon after, I met a man whom I knew well, staggering through a busy street in the middle of the day. I went to see him, and had a neighborly talk with him; and before I left, he said if I saw him again in a state of intoxication on the streets, I might have him arrested. He kept sober a few weeks, but finally he forgot his promise, and I saw him reeling from one side of the street to the other. I was as good as my word; and as the other friends made similar arrests, in a little time it was pretty well understood that the town of Medina, at least, would not permit intoxication on the streets in open day. The result was good, without any question, but it has made me enemies among a certain class, and I presume they will be enemies till the day of my death. One can not be a *consistent* follower of the Savior, and go through the world without some trouble and hard feelings, and many times without making neighbors feel very bitter

and hard. I have often pondered on this, and I have watched the lives of great, strong, good men, to see how nearly they could go through life and live at peace with all men, as Paul advises. One may get along in the world by letting things go about as he finds them; but if he takes hold of the work of rebuking sin, he must meet trials and difficulties. I have often told you of the pleasant friends and neighbors we have here in our factory. I have told you, too, how many times I have thanked God for sending to me such pleasant neighbors and companions; but yet, dear children, it is not all pleasant. As a rule, those who have once worked here prefer to stay; and although occasionally a boy or girl wants to go away, as I shake hands with them in parting, I sometimes tell them that they will probably come back again after a while, and they almost always do. Even our girls after they get married, frequently come back and want to take their old places. We are rejoicing now in having our friend Ida with us again, although when she got married and went away last summer we hardly expected to have her among us again. Such things are a comfort to me, for it indicates that those who go out on the world and try getting work elsewhere seem to miss the pleasant associations and influences of our home here, as it were; and it always does me good to receive a letter from one of our former helpers, asking if he can not have his old place back again. Now about the unpleasant part.

Employing, as we do, over one hundred different people, of all ages and dispositions, it would be strange indeed if it did not happen now and then that the good of the establishment makes it necessary that some one of the number be suspended, or dismissed altogether. How shall this be done? How shall a Christian employer tell one of his helpers he can not keep him any longer? Of course, the first thing to do is to go to him as I went to the drinking man, and tell him plainly and kindly what he may expect if he does not amend. More than that, the employer should be patient and long suffering, and not until he is fully satisfied that there is no hope of amendment should he decide upon a dismissal. How can such a thing be done, and be done with kindness? or, indeed, can it be done at all so the one dismissed will take it kindly? With sadness and sorrow I have been obliged to decide there is no way. If the one who is reproved or rebuked is trying to do right, there probably will be no trouble; for a Christian will take reproof meekly and quietly, and without hard feeling, even though the reproof be undeserved and unjust. Do you know what Peter says?

What glory is it, if, when ye be buffeted for your faults, ye shall take it patiently? but if, when ye do well, and suffer for it, ye take it patiently, this is acceptable with God.—1. PETER 2:20.

One who deliberately proposes to do wrong, however, will usually take reproof or rebuke in a hard and revengeful spirit, and will lay up and cherish hard feelings, many times for years. I have often been called very patient, and in some respects I presume I am patient, especially since I have been trying to serve the Master; but yet there are few

things I have prayed more earnestly for than for more charity, more love, and more forbearance with my fellow-men. I have heard my mother say, that when I was but a wee child, busy with my playthings on the floor, I was remarkable for my wonderful amount of patience. The older children sometimes used to have sport with me by trying to see how far my forbearance would go. They would tear down my machinery and houses, and with great pains and meekness I would go to work slowly and build it all up again. If knocked down once more, I would probably let it go, and go to work and do it all over, and so on, till a stranger might be tempted to think I had no spunk at all. But my mother, who knew me better, said she always knew that my patience would hold out only to a certain limit: if tried beyond that limit, or until I was thoroughly aroused, I became a tiger, almost, with passion. I then frightened the whole household by the vehemence and unscrupulousness with which I grasped whatever might be at hand, and soon made my persecutors flee as if for their lives. Long and patiently did my kind mother strive with me through my earlier years, to beware of this bad temper; and in later years I have learned by the grace of God to keep down these feelings (even when I felt that forbearance had ceased to be a virtue, as the saying is) and, instead of breaking forth vehemently, to do what must be done, with meekness and gentleness, and I think I have been enabled to do the latter pretty well. But of late, God has been teaching me another lesson; and that is, to rebuke sin and wrong when it first commences; to speak out plainly and decidedly, although kindly, when things just commence to go wrong. And just now, dear friends, old and young, my most earnest prayer is for grace and wisdom and understanding in this very hard and difficult matter of protesting against sin and wrong wherever it comes within my province to do so.

Be not afraid, but speak, and hold not thy peace: for I am with thee, and no man shall set on thee to hurt thee.—ACTS 18:9, 10.

HOW I BECAME A BEE-KEEPER.

SOMETHING ABOUT BEE-KEEPING IN OLD TIMES.

WHEN I was quite a small boy, father took a colony of bees of a neighbor living about a mile distant, to keep on shares, each to have half of the increase and half of the surplus honey. I suppose the older readers, if not the juveniles, know that in the early days of bee-keeping the surplus was mostly taken by killing the bees in the fall, with the fumes of burning brimstone, and then taking whatever honey they had laid up for winter. Thus, when fall came, the neighbor and father would look over the bees, and decide how many and which colonies should be killed, after which the honey obtained was divided equally between them. If more was obtained than was necessary for family use, a portion was taken to our nearest village (this being always the best part), and exchanged for groceries, boots, dry goods, etc. I well remember the pails of beautiful snow-white comb honey father would carry to town, which was obtained from second and third swarms, thought to be too light to winter,

while all the darker combs, and those filled with bread, were left at home for our consumption, to be used in the shape of "strained honey," the straining of which was the part allotted to mother. This was done by chopping up the combs till every cell was broken, and then putting into a bag made of thin cotton cloth. This bag was now hung up close by the fire, and allowed to drain all it would into a vessel placed underneath it. The quality of this honey was pretty fair; and if no dark honey was in the combs it would approximate very closely to our white extracted honey. After all had drained out, which would do so by hanging by the fire, a large pan was placed in the oven, and several long sticks placed across the top, when the bag was placed on the sticks. The oven was kept as warm as possible and not melt the wax very much, and in this way quite a quantity of rather inferior honey was obtained, after which the bag and contents were placed in a kettle of warm water and worked till all the sweet was got out. This water was now boiled down, and, when as thick as molasses, stored away to make apple pies, etc., with.

To look back now to my boyhood days, it seems to me those pies, etc., sweetened with "honey water," as we used to call it, had a taste superior to any we now have, made with our best granulated sugar. Another thing I wish to say right here is, that we often read, where strained honey is being compared with extracted, that the latter is the clear nectar of the flowers, free from all impurities, etc., while the former is a mixture of filth and honey, obtained by mashing dead bees, brood, and bee-bread, together with the combs of honey, and squeezing the whole through a cloth. From all the knowledge I have, I would as soon risk the cleanliness of strained honey as that of extracted; for at our house, nothing looking like dead bees, brood, or filth, was ever allowed in the sack from which the honey was strained, while I have seen hundreds of disgusting-looking larvæ, together with the food given them, floating on a vessel of honey where extracting was being done from the brood-chamber of the hive. The killing of the bees to get the combs, the destroying of the combs, the mixing of light and dark honey, and the slight taste of pollen, was all I could ever see which was objectionable to strained honey. But, to return.

After a few years the bees from the first colony above referred to had so increased that a division was made, and the neighbor took away what belonged to him. I was now large enough so I could watch the bees; and during the months of June and July, whenever I was not at school, I was stationed near the apiary from 10 o'clock till 3, to look for swarms. I often got tired of being thus confined; but as father thought that all should bear an equal share of the burden of supporting the family, I was kept at my post instead of being allowed to roam the streets and fields with other boys. About this time, father concluded to try to get his surplus honey by placing large boxes holding from 15 to 20 lbs. of honey on the hives. These were placed on top of the hive, or at the side, as he thought best. On one occasion he hived two swarms (which clustered together) in one hive, placing thereon one 20-lb. box on top, and two 15-lb. boxes one at each side. To place them at the side, the hive was raised on half-inch blocks, and a slot was cut in the bottom of the boxes, $\frac{1}{2}$ inch by 8 inches, and these slotted sides placed next the hive. The result was, that he took four 15-lb. boxes at the sides, and cut the 20-lb. box

from the top, making 80 in all, $\frac{1}{4}$ of which was procured at the sides. After this he boxed most of his hives at the side; and from his success with such large side boxes, I took the idea of using the wide frames, interchangeable from side to top, as I now use them.

About this time, one morning when father was about leaving home on business, a small second swarm came out; and as he was in a hurry, I persuaded him to let me have the swarm, upon consideration that I should have it. Heretofore I had never hived a swarm, and it took some little courage for an 8-year-old boy to climb to the top of a tree to get a swarm of bees for the first time; so I thought, at least. Well, I hived them and watched them, going every day to the hive to see them work; and when fall arrived with cold nights, I used to tap on the hive for the "good-morning" answer, which was always sure to come. I went one morning, tapped on the hive as usual, but no response, and the hive sounded hollow and empty. I tipped it up and peered in, but no bees, and combs were there, as my eyes usually beheld. Only the box remained, for some person (I came near saying *villain*) had taken the hive to the woods the night before, and killed the bees, and taken the honey, as the charred and combless hive proved. Then my bee-keeping came to an end for some time. That dread disease, foul brood, got into the apiary, and in two years father had lost all his bees by it. After a period of 14 years, I started in bee-keeping on the improved plan, and in my next (April JUVENILE) I will tell you how I began. G. M. DOOLITTLE.

Bordino, N. Y., March 1, 1884.

Well done, old friend. It would seem from the above, that side-storing boxes are quite an old idea; and if your father was not the first inventor, he was at least one of the first. It does seem to me as if a large colony, one that is disposed to cover the whole outside of the hive in the height of the season for instance, would do more work with an opportunity to store at the side of the brood, than it would if they were obliged to work altogether in boxes placed above. I suppose the size of the frame has something to do with this, however, and that a very shallow frame might give almost as good results with the boxes all above, while a tall frame, or even a square one like yours, might require surplus room at the sides to get the same advantage.

EXTRACT FROM AN OLD BEE-BOOK.

HOW THEY TAKE HONEY FROM THE APIS DORSATA.

A LARGE swarm of bees had fixed their abode on the ceiling of a verandah, and when their honey was deposited, we wished to collect it, but were for some time at a loss for the means. Hearing, however, that there was a gardener who possessed a peculiar art of doing it unhurt, he was sent for, and desired to bring down the honey. I watched him, and believe he used no other precaution than the following: He took some of the plant called toolsey, and rubbed it over his body, face, arms, and hands; he then chewed a little, and held a sprig of it in his mouth; and with no other than this apparently slight defense he mounted a ladder, a large dish in one hand, a sharp knife in the other; and although very thinly clad, with thousands of bees swarming around him, he with the greatest coolness cut through the upper part of the comb where it was suspended to the roof, receiving the whole of it in the dish, and brought it down without having received a single sting.

This is copied from "Indian Reminiscences in the Bengal Moofussue," that same old book published in 1838, in England.

ROSEY SMITH.

New Hamburg, Ont., Can., Feb., 1884.

LITTLE AH SID.

A LITTLE CHINA BOY'S EXPERIENCE WITH THE AMERICAN HONEY-BEE.

Little Ah Sid
Was a Chinese kid,
A cute little chap, you'd declare;
With eyes full of fun,
And a nose that begun
Right up at the roots of his hair.
Jolly and fat
Was this frolicsome brat,
As he played through the long summer day,
And braided his cue
As his father used to
In Chinaland, far, far away.
Once o'er a lawn
That Ah Sid played on,
A honey-bee flew in the spring.
"Melican buttefly!"
Said he, with closed eye:
"Me catchee and pull off um wing."
Then with his cap
He struck it a rap,—
This innocent honey-bee,—
And put its remains
In the seat of his jeans:
For a pocket there had the Chinese.
Down on the green
Sat the little sardine,
In a style that was strangely demure,
And said with a grin
That was brimful of sin,
"Me mashee um buttefly sare."
Little Ah Sid
Was only a kid:
Nor could you expect him to guess
What kind of a bug
He was holding so snug
In the folds of his loose-fitting dress.
"Ki-ya! ki-yip-ye!"
Ah Sid cried, as he
Rose hurriedly up from that spot.
"Ki-yi! yuk-a-kan!
Shame on Melican man—
Um butteflies velly much hot."

THE DISCOVERY OF SILK.

COMPILED AND WRITTEN BY NELLIE LINCOLN ROSSITER.

Continued.

AT a later period, Spain and Portugal received from their Arabian conquerors the art of fabricating silk. It was in 711, under the Caliphs, that the Saracens conquered Spain; and they soon taught the inhabitants of that country to improve their agriculture, their manufactures, and their arts. "With the same vigor," observes Professor Dresch, in his *Universal History*, "with the same earnest zeal with which they fought for more than a century, they pursued the cultivation of science, under the auspices of the great Caliph Haroun al Raschid," the contemporary of Charles, and his son Al Mamun. These sovereigns regarded it as a maxim of policy, that the welfare of a nation consisted in its civilization. The Koran had classed agriculture, industry, and commerce, among the good deeds of the believer. Like the Roman senators, who took their surnames from the plants which they had principally cultivated, as, for instance, the Fabii and Lentuli, the Arabian chieftains were fain to adopt, in the quiet of their private lives, names alluding to their skill in some manual industry; though at that time, Central and Western Europe knew of no other pleasure than that derived from war, from wine, and from the chase. Charlemagne was the only sovereign who made any provision for the cultivation of the mind; but the bene-

fits he conferred terminated with his life; and, from that time, the Arabian empire was the only seat of science, industry, and civilization. We owe them much in regard to agriculture; we are indebted to them for the manufacture of paper; for the expression of quantities by figures; and for many improvements in the art of dyeing; nay, our language bears numberless traces of the inventions transmitted to us by the Arabians. The historian and bishop, Otto de Freysingen, speaking of the great progress which silk manufactures had made in Spain, relates that, after the siege of Milan, Frederick I. held a diet of the empire, in 1158, in the fields of Roncaglia, at which were present, in magnificent attires, the ambassadors of the Genocse, who recently had conquered from the Saracens two important cities, Lisbon and Almeria, both famous on account of their manufactures of silk, and had made a rich booty. The later wars, and the defeat of the Saracens, might have been the cause that this species of industry did not pass the limits of the Spanish Peninsula, and fell partly into decay; for it can not be doubted that the rest of Europe received it from Greece." Greece remained for a long time in the possession of the silk culture, and it seems that the Saracens were never acquainted with the breeding of the worms, and were skilled only in the art of manufacturing beautiful stuffs from the raw silk, which they received from the great emporium of Bagdad. The war of 1146 introduced that culture into Italy. According to historical authority, Roger I., the Norman king of Sicily and Naples, hearing that the great Emperor Manuel Comnenus was negotiating an alliance against him, with Conrad III. of Germany, resolved to send an embassy to Constantinople, in the hope of averting the danger which threatened his power, and to propose a matrimonial alliance with one of the daughters of the Emperor; but Manuel threw the ambassadors into prison, and Roger, having accordingly collected his land and maritime forces, was so fortunate as to conquer successively Corfu, Cephalonia, Negropont, Corinth, Thebes, Athens, and several other cities and islands of Greece: from whence he carried with him into Sicily an immense booty, and several thousand captives. Among the latter were a great number of persons acquainted with the culture and fabrication of silk. Roger gave orders to treat them with much kindness, and persuaded them to settle in Palermo, offering them the most advantageous conditions. They introduced there their useful industry, and opened manufactures which soon acquired great celebrity; and from thence it was transmitted to the Calabrians, and at length propagated through the rest of the kingdom of Naples.

MR. LANGSTROTH.

MRS. HARRISON TELLS US ABOUT HIM AT THE CONVENTION.

DEAR JUVENILES:—When I was at the bee-meeting at Chicago, I looked around for you; and, sure enough, two of you were there. No girls, but one boy in petticoats, and another in knickerbockers. The little one will not remember being there, but the one in knickerbockers will; and when he is an old man, and a grandpa, he will tell how, when he was a little boy, he went with his father and mother, in 1883, to Chicago, to a bee-meeting, and saw Mr. Langstroth.

Some of you will say, "Suppose he did see Mr. Langstroth, and we didn't, what of that? And what makes bee-keepers talk so much about him?" Well, children, when my grandfather, and your grandfather, and their grandfathers before them, kept bees, they kept them in hollow logs, and they didn't get nice white honey as we do. In the fall they would lift their "gums," as they called their hives, and see if they had honey enough to winter upon; and if they thought they had not, they "tuk them up," as they called it. They first dug a hole in the ground, and dipped some dry sticks in melted brimstone, and put the sticks into the hole; set it on fire, and placed the gum over it. In a few minutes the bees were dead, and then they cut the honey out. Sometimes they got a little nice white honey; but most of it was dark comb and bee-bread. What a time the grandmothers had straining the honey! They kept a bag of it before the fire for days, so it would drain out.

When Mr. Langstroth was a boy he watched insects and ants, to see what they were doing, and thought a great deal about them. And when he grew to be a man, he taught my father, and your father, and everybody's father, how to keep bees in movable-frame hives, like those we all use now. Don't you think it makes Mr. Langstroth happy now, when he is an old man, and a grandpa, to know that people all over the world are made happy by him? And will you not all try to do something useful, even if you are little children?

Peoria, Ill., Feb., 1884.

MRS. L. HARRISON.

A TALK ABOUT ALASKA.

BY ONE OF OUR FORMER OFFICE GIRLS.

DEAR MR. ROOT:—Taking such a deep interest as I do in every thing juvenile, I can't resist telling your little ones some very interesting facts that I learned from a missionary sermon yesterday, on Alaska. The speaker, Dr. Sheldon Jackson, an eminent missionary, illustrated by maps that almost God-forsaken place. I say "God-forsaken," because our government has never taken the trouble to establish schools there, so the majority of inhabitants know nothing about the Bible, and have no one to tell them about their Savior.

In the extreme south-eastern section, some few missions have been established; and here, too, the Russians have built a few Greek churches. Where the few missions have been founded by our church they are crowded, and the glad tidings of salvation they disseminate flies from village to village, until chiefs with their entire tribes forsake their comfortable homes and come flocking to these missions to hear about the "man who came down from the skies to take the bad out of men."

But first I must tell our little friends about the people of this desolate region. The entire coast line of Alaska is inhabited by a peculiar people called the Esquimaux, about whom you have doubtless heard so much—a hardy race of people, strong, and many of them over six feet in height. If only civilized and educated, they would be of great use to us in our marine service. Further inland we find tribes of Indians with awful names, which, if I even made out to spell, I am afraid you could not pronounce, so I will not try it. And here it is where schools and missionaries are needed so badly. What do you think, my little friends, of a man when he

comes to die, having a female slave killed first, so her soul shall penetrate the "dark region" and prepare a place for him? Yet such is the case; and here, in direct defiance of our own laws, in this land of the free, slavery still exists, and men and women are yet in bondage—in Alaska. What do you think of old women, in this enlightened age, under the stars and stripes, being burned for witchcraft? When a man gets tired of his own mother, he leads her out of her own home, kills her, and leaves her remains for the dogs. Mothers take their offspring into the woods and leave them to the mercy of the wolves, in preference to their living and suffering the degradation they endure; and to this day, when these poor people wish to avert some threatening disaster, such as glaciers, etc., they offer up human sacrifice. Generally, female slaves are used for this purpose. The government has forbidden the importation of liquors here, so it is smuggled up from San Francisco in bottles labeled "Jamaica Ginger," "Florida Water," etc. Why! but a short time since, the inhabitants of one of those small islands off the coast of Alaska traded all their furs for liquor, and spent the entire summer in drunkenness; and so, when the winter season came on, having no supplies laid in, hundreds of men, women, and children literally starved to death. Isn't this terrible? And yet for sixteen years the great men of our nation have permitted these things; and even now, while they talk of so much money in our Treasury that even they know not how to expend it, no thought of establishing schools for the enlightenment of these poor people, who are still away back in the Dark Ages, ever seems to occur to them. An effort is now making to brighten their intellects a little, and a bill will soon be brought before the House for the establishment of schools in Alaska.

Dr. Jackson closed his able discourse with the prayer that every effort we all could make, either in work or prayer, would be to the effect that speedy relief might soon be given these poor people who are living and dying so, in sin and ignorance.

Washington, D. C., Feb. 4, 1884.

BESS.

RECOLLECTIONS.

NOT ALL ABOUT BEES.

I DON'T think, like some old men, that children and grown-up people don't enjoy themselves as they used to in olden times. I think human nature is the same now that it was when old men were boys. Years upon years have made individual changes. Boys now delight in the same sports boys did fifty years ago. Empty a boy's pocket then, and what would you find? A perfect Noah's ark of articles—broken knives, marbles, leather strings, rusty nails, pin hooks, and fishing-lines, old buckles, pieces of flint, and all sorts of other articles, of no value whatever.

They would then go out to mud-puddles, and make mud pies and images, and set them on bark in the sun to dry; gather hickory-nuts and walnuts in their hats; yes, and pack rocks, too, in their old wool hats to throw at squirrels.

I am pretty sure the hats in those days were better made than they are now. A hat then went through a whole season. I have left mine out over night when a rain would come up, and in the morning I would find it full of water to the brim, and holding almost equal to a tin pail. By such usage they

would lose their shape, and "go to seed," as they then called it, shaping themselves like the loaves of white sugar of the long ago, that were wrapped in stiff purple paper. They lengthened and strengthened.

Boys had dogs then, and but few boys were so poor as not to have a dog they claimed as their own property. During the summer months, on Saturdays, the boys of the neighborhood, by previous arrangement, would collect together and go through the woods with their dogs, hunting snakes, turning over old rotten logs and stumps for field mice and moles, and climbing partly decayed trees in search of flying-squirrels.

One of the favorite sports at that season of the year was in breaking up the nests of bumble-bees. Armed with a clapboard paddle and bunches of pennyroyal or elderberries, they had fun, and many an eye has suffered in darkness for two or three days on account of an evening's sport with the bumble-bees.

The dogs were generally put in on the first charge. The bees were first stirred up and out, and then a general throwing of chunks, sticks, and rocks, at the rest, with "sick him, sick him, sick him!" and a clapping of hands. Not knowing what was up, the dogs generally were prompt to obey, and rushed in to where the sticks were thrown.

Dogs are like men and boys in this—they have different dispositions. When the bees commenced to alight upon and sting them, some would stand their ground, and whirl round and round, snapping at the bees until they would be almost covered before retreating. Others would lie upon the ground and roll over and over, and keep on rolling. Some others would go straight to their masters, covered with stinging bees, and try to rub against them to rid themselves of the bees, while others would tuck their tails and make a bee-line for home. It was fun for the boys, but it was a very foolish young puppy that could be coaxed into a second charge.

Murfreesboro, Tenn., Feb. 18.

UNCLE BILL.

BROTHERLY KINDNESS.

IS IT AS COMMON AS IT OUGHT TO BE?

DEAR JUVENILES:—Mr. Root was telling us how it pleased him to be called "Brother." I often think what a beautiful thing brotherly love is—not alone as shown to all mankind, but such as I have seen manifested between two brothers of one family. True love between brothers and sisters has been seen so often as to hardly cause comment; but *strongly* manifested love between brothers is rare.

I knew two brothers, now grown up, who always seemed to think so much of one another that, no matter how often they met through the day, they always had a pleasant greeting for each other. A favorite greeting, when not near enough to speak, was a peculiar whistle, which was always responded to, under all circumstances. Once when the younger had been away from home for several months, the elder had business in the same city, and so without telling Charley he was coming, he inquired for him at his boarding-place, and was told that he had gone to the park, near by. So he started out to find him. As luck would have it, he saw (or thought he saw) Charley among some people several rods away. Giv-

ing his greeting whistle, you should have seen Charley jump, said my informant merrily. The sound came so unexpectedly to him that he jumped two feet, and you may be sure that he was not long in reaching his brother's side. Other instances I could cite, but that always made a warm spot in my heart for those two boys. Some think it foolish to show love; but honest love is lovely, and some may laugh when love is shown; but in their hearts they would like just such love shown them. So, children, do not be ashamed to show your love, and cultivate the feeling for God and all mankind.

About 20 miles from here is a lovely falls called the Najoqui, pronounced *Nah-no*. We went up there last Sept., and I am sure you all would like to see it. One of our party said he did not believe it would pay to walk a quarter of a mile up hill to see some water fall over some rocks; but we persuaded him to go with us. So he hitched his horse with the rest of them, to some sycamore-trees, whose white bark was literally covered, as far as could be reached, with the names of those who had come to see the falls. The path is a gradual ascent, often crossing the brook made by the water of the falls. After going up about a quarter of a mile we came to a sheer wall 160 feet high, and about 50 wide, whose entire face is covered with lovely ferns and moss. Down the center, like a lovely silver ribbon, the water falls. Even our indolent friend exclaimed, "How beautiful!" Beautiful indeed it is, causing feelings of thankfulness to God for making such beautiful things. Then the cry came, "Oh! I must have some of that moss and those ferns." For about 5 feet the wall has been dug away and taken away little by little, but the moss and ferns keep covering up the broken places, making it lovely, in spite of vandals. A sign is placed near the falls, telling the height, and asking visitors not to deface the walls. The water comes from a spring close to the wall.

MRS. HILTON.

Los Alamos, Cal.

I have often thought of what you say, my friend; and as I look back to my own boyhood, I feel rebuked to think that I was sometimes cross and short to my brothers. I had one older and one younger. One little incident comes back very often to my mind as I look back through the years. It is a trifle, but it will help me to illustrate what I wish. One morning we were awakened rather early, to go to work in the hay-field. I do not know but we all felt a little cross for being broken of our slumber. As we came down the old stairs, "Jess," my younger brother, remarked:

"Ame, your suspender is twisted."

Of course, I ought to have thanked him for it by looks, if not by words; for even if I did not notice it then, it would probably feel uncomfortable after a while. What do you think I did do, my little friends? I replied gruffly, "Well, that is *my* business." He did not say any thing, and we went out to our work; but I have thought of that speech many and many a time; and since I have grown up to manhood I have written to Jess and asked his forgiveness. But for all that, I would give ever so much to have the privilege of taking back that rude, coarse speech. Speak gently, boys, even if you *are* awakened at unseasonable hours, and you will thank me for this little advice in after-years.

ONE OF THE JUVENILES WHO ATTENDED THE TORONTO CONVENTION.

HOW I MADE A MISTAKE OF 12,500 BASKETS OF PEACHES.

WELL, Mr. Root, I am pretty much interested to-night—so much so that mother sent me after a pan of flour and I brought her a pan of meal, and then I had to go back. I was looking over some of the back numbers, and I came across the October number, in which was the report of the Toronto Convention, in which you told us what you saw from Medina to Toronto. Pretty good it was too; but it made me feel a little bad when you told us about that man in Buffalo who made the remarks about his family when he drank that poison whisky, for I am all temperance.

Well, now, about Niagara Falls. You got only a small view of the Falls on the cars, for I think if you would stop and look around you would change your mind when you see what nature has done. Now about Niagara, and that 15,000 baskets of peaches that that fellow told you there were. Well, he was just about 12,500 out of the way, for the captain said there were about 2500 baskets, and about 700 passengers on board, which makes a good load for that boat. A few of those nice peaches on the boat were from our orchard.

Well, you will like to know how I know. I was there, and friend Moon too, for we were bound for the convention, for we live just across the river. I said friend Moon, and so it was, if it was a man and boy, for we both keep bees. When the train came down, I looked to see if I could see any one who had a ribbon on his coat, with a bee on it, but could not. I think it would be a good plan if A. I. Root would wear something different from other folks (when he goes to conventions), so we could tell him; but the next day I made out to get a sight of him; for when I first went into the apiarian building, I looked around to see Mr. Root, but could not. Pretty soon a man says, "Where is Root? I want to give him a taste of this honey;" and another fellow standing by him says, "Oh! Root is like bad weather." But pretty soon up he comes, and gets a taste. "Pretty good," he says. Well, I should judge it was, by the looks of it. It was wonderfully clear.

Now about my bees and honey. Started in with 4 stands; increased to 13, all in good condition; got only about 100 lbs. of honey; bought lumber to-day to make my hives.

AUGUSTUS MORRIS.

Youngstown, N. Y., Feb. 12, 1884.

Friend Augustus, you ask why I did not tell who I was, or wear a badge with a bee on it. Why did you not tell me who you were? or, in other words, why didn't you come right up to me and say, "Mr. Root, I am Augustus Morris, a boy bee-keeper, and I have wanted to see you?" That would have been just what I wanted to hear when I was away up in Canada, away from my own people. Some of them did say so, it is true, but I presume there were a good many others who, like myself, felt a little bashful and backward about making themselves known. On some accounts I should like to wear a badge, and then, again, it makes one look a little conspicuous, and I always dislike to crowd myself anywhere. I found some very warm friends indeed in Canada, and especially do I remember some bright-faced boys

whom I should long to get better acquainted with, so I might remember them when they write to me.

AN INGENIOUS SUGGESTION BY A NINE-YEAR-OLD JUVENILE.

REMOVING DEAD BEES WITH THE EXTRACTOR.

ON the 2d of February, the sun shone bright, with a light warm breeze from the southwest; thermometer at 59°. Bees were flying at 11 A. M. as if in the height of the clover season. While looking at them and rejoicing, I noticed that there was something the matter with colony No. 16. On opening it I found the bees dead—queenless—and that the bees leaving and entering it were robbers. I closed the entrance until evening; then I examined it, and found that they had about 20 lbs. of capped honey yet, and that the bees, about one pint, were all in the cells of one comb. While I was picking out the dead bees with a pin, my son (the only one) 9 years of age said, "Pa, why don't you put the comb in the extractor, and throw them out?" I told him the wire would prevent it. "Well, can't you fasten it on the outside of the wire?" The idea was a good one, so I told him we would try. I tied the comb to the outside of the comb-basket, so that in turning, the top-bar of frame (Langstroth) would follow the bottom-bar, and, to my astonishment, about ½ of the bees were slung out of the comb against the can, rattling as if shot were thrown against it; but the rest would not come. I put the comb in a warm room. A few days after, I tried again. This time it cleaned the comb. Did you ever try it? I wish that those who lose bees, and which stick in the comb, would try to report. The reason it did not do its work effectually the first time was the bees were swollen by the dampness of the hive; but after the dampness was gone, they could be easily ejected, because they became smaller by shrinking.

JOHN W. STURWOLD.

Haymond, Ind., March, 1884.

Friend S., tender my thanks to your 9-year-old hopeful for his very ingenious idea. Many years ago one of the friends invented a pair of pincers with which to pull dead bees out of the combs. I presume that more than one of our friends have tried the job, and gave it up in disgust. If you get hold of a dead bee's wing, you can usually pull him out; but, oftentimes, off comes the wing, and then half of the body, and he is not out yet; and, worse still, even if they come out nicely, it is a pretty big undertaking to pick a swarm of bees out of the combs with one's fingers, or even with the pincers. The boy's idea is away ahead of it, especially after your improvement of drying the bees so they will come out easily. Perhaps if they were dried enough they would jar out. But now after all this talk about it, why not just hang them in the hive and let the bees do it? They work cheap, and seem to have the knack already learned, for I have known an active swarm of bees to clean out and fix up and scrape off the mold from an old comb, and get it partly filled with honey, in just one afternoon. Circumstances, however, might make it quite handy to do it with the extractor.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Out, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chief's amang ye, takin' notes;
An' faith, he'll prent it."

WELL, children, here it is spring again. Very likely the bees are flying some with many of you. I notice your letters are flying briskly, for my drawer, labeled "Juvenile Letters," has got so full that "Kitty" (she is the clerk who distributes the letters, you know) can hardly get any more letters into it, so you see I shall have to begin again picking out the most valuable letters. That seems a little hard, but I guess it is a good thing. It is a good old maxim, that "competition is the life of business," and sharp competition does us good in almost any kind of work. In your case you will find that, in order to see your letters in print, they must be good ones: that is, they must be something new and something valuable. Yesterday one of the juveniles wrote a short letter, and commenced: "I thought I would take my pen in hand to drop a few lines to let you know that I am well, and hope to find you the same," etc.

Now, little friends, there is not any need of telling me that you take your pen in hand; because when I see your writing, I should know that already; and besides, it is an old hackneyed phrase. I would try to avoid hackneyed phrases. Don't try to copy other folks. Just be yourself. In a letter just now before me, an 11-year-old chick starts out: "I thought I would write you a few words about the bees." Now, do not think that I am scolding, or finding fault; but such words do not tell us anything. They only tell us you thought of writing, which we know already, if you write. If you do not write, of course we don't care any thing about it. I have had to talk quite a considerable to some of the older ones, because they were inclined to tell more about what they *thought* than what they *did*. Now, then, would it not be better to tell us more about what you have done, or seen somebody else do, than to tell what you have thought? Thoughts are good, of course; but they are seldom worth putting in print until they have been worked out practically into ac-

tions. When we get new clerks in the office I have sometimes told them when they write to anybody, to pitch right into business, and not stop for formalities. You will notice our postal cards and letters to you go right into the business before us all at once, without any "Dear Sir," or prefaces of any sort. And where room is crowded, and there is so much to be done, I think it is the better way. Of course, I refer to letters on business. When you are writing to friends, it is a different matter. Another thing: Some of the juveniles seem to think they must write a long letter. Never try to make your letter long, unless you have something valuable to write. In fact, it takes a great amount of my time to cross off a great part of what many of you write.

Now let the little letters come like the snowflakes flying outdoors, if you choose; but let us have them short and bright. I think, as a rule they ought to be a little larger than a snowflake; but one side of a small sheet of paper will be enough, as a general thing. Now, then, go ahead.

NO TOBACCO.

We have 14 hives of bees. Papa does not use tobacco, and I aim to always let it alone. Will you please send me the Giant-Killer?

JOHN MITCHELL, age 8.
Poplar Grove, Ind., Feb. 16, 1884.

SAMUEL'S LETTER.

I am a little boy 8 years old. My pa keeps bees. He has 40 stands. I like honey. I go to school, and read in the Second Reader. I have a pig, and I have one sister and three brothers. SAMUEL HAMM.
Kingston, Mo., Feb. 13, 1884.

Pa keeps bees. He has 98 colonies. He has them all packed for winter. He is going to put them in the cellar. Two years ago last spring we had only two. Pa made a litter, I will call it, to carry the hives with. EDDIE STOUT, age 12.
Brighton, Iowa, Nov. 30, 1883.

STELLA'S LETTER.

Our bees were out all day Sunday. I would like to know what they were doing. Our bees are all blacks. I have a little pet lamb; her name is Julia; she is the prettiest little thing I ever saw. She will come whenever I call her. STELLA HOWERTH.
Pin Oak, Ill., Jan. 15, 1884.

A SWARM OF BEES IN AN OLD HOUSE; REPORTED BY A 7-YEAR-OLD FRIEND.

I should like to see your little Huber. I have six brothers and one sister. Papa has 18 colonies of bees. One of my twin brothers, Jonathan, has one, which he found in an old house. I will send flower-seeds for Blue Eyes. If you think this is worth a book, send me one. LIZZIE STUTZMAN, age 7.
Girard, Ill., Feb. 19, 1884.

FRANCIS HUBER: BY ONE OF THE JUVENILES. François Huber was born at Geneva, July 24, 1750. When he was young he lost his eyesight; and some years after, he married Mlle. Lullin. Huber's first work was entitled, "Lettres à Ch Bonnet." It was reprinted in 1796 and 1840, under the title of "Nouvelles Observations sur les Abeilles," which means in English, "New Observations on Bees." Huber died at Lausanne, Dec. 21, 1831.

MARY M. GRAHAM.
Homer City, Indiana Co., Pa., Feb. 23, 1884.

100 HIVES OF BEES, AND ALL IN THE CELLAR.

I am a little boy 7 years old. My uncle, John Meyer has nearly 100 hives. They are all in the cellar now. But it will be fun to see them in the spring when he takes them out. JOHNIE WOODWORTH.
Wyandotte, Kansas, Jan., 1884.

EDWIN, THE BEES, AND THE DUCKS.

Pa has 41 stands of bees; all wintered very well. The queen that he got from you last summer died. He was afraid that the other bees would rob them, and told me to move the blocks back to contract the entrance; but just as I went to put it back, one of the bees stung me. My big white Pekin ducks are nearly as large as a goose, and have yellow bills and short yellow legs. Did you ever see any Pekin ducks?
EDWIN F. GRUBB, age 10.
Key, Belmont Co., Ohio, Feb. 21, 1884.

HOW TO COOK TOMATOES; BY ONE OF THE JUVENILES.

My mamma keeps bees. We have 6 stands. We got 40 lbs. of honey. I will tell you how to cook tomatoes. Put some hot water on them, and scald them, and then peel them. Put them in a kettle, and let them boil awhile, and then salt and pepper them; butter them, and then put bread in it.
Feb. 20, 1884. CARRIE DARISSOUR, age 9.

Now, Carrie, I know that recipe is a good one, because I have seen my wife do the same thing—at least, as well as I can remember, and I should call you a pretty good 9-year-old cook.

HOW SHALL WE CURE A KICKING COW?

We have 7 horses and 4 cows to feed, and I have to go about a quarter of a mile to feed the sheep. Can you tell me how to break a kicking cow? We had one, and she kicked so that we had to sell her for twenty dollars. She was one-half Jersey, and she was a good butter-cow. I should like to come out there and see your bees, and see all your things.
FRANK MITCHELL, age 10.

Poplar Grove, Ind., Feb. 16, 1884.

Friend Frank, I am sorry to say I am not posted in regard to the most intelligent, humane, and Christian way of curing a kicking cow. While I think of it, I should be very glad to have Prof. Cook tell the boys just what to do in such cases. Now, friend Cook, won't you come out of the "harness" just a minute, and do some good by answering Frank's question?

CUTTING A BEE-TREE.

Papa has 9 swarms of bees, and I have one, and mamma has one. Last summer we went to cut a bee-tree, and we did not get the bees all that night, and we went back next day to get them, and they were not there. Papa looked around and found them on a tree, 50 feet from the ground, and I climbed up and cut the limb off with a knife, and carried it down, and got stung but once. Papa can't climb better than a cow.
LENNY L. LUCAS, age 11.
Jewett, Ohio, Feb. 23, 1884.

Seems to me, my little friend Lenny, your illustration about your papa's abilities in the direction of climbing trees is not very complimentary. However, we suppose he is a grand good papa in other things, even if climbing trees is not his especial forte. I am glad of one thing, and that is, you got down safe without getting hurt.

FROM 2 TO 14, AND ONLY 30 LBS. OF HONEY.

My pa had two hives of bees in the spring, and increased to 14. He got only 30 lbs. of honey. But he is working for increase more than for honey. He has hauled sawdust to set the bees on.

Perrysburg, O. SHERIDAN E. HOWER, age 13.

Why, Sheridan, if two colonies were increased to 14, and they lived through the winter, I should think 30 lbs. of honey was a pretty big lot, especially if the younger swarms (poor little dears!) did not any of them starve outright.

EDDIE'S COMPOSITION ON BEES.

Bees are a very useful insect. They make nice honey and wax. On cloudy days they make their wax, and on nice days they gather their honey. They are busy all the time. In the summer they swarm; and if the folks do not watch them they will take a shoot; and if they have no place to go to they will alight on the fence-rails and other places till they die. That is all I can say about bees. If you send a book, I will take "Harris on the Pig."

EDDIE SHERER.

Inwood, Marshall Co., Ind., Feb. 21, 1884.

That is a pretty good composition, Eddie, providing it were all true; but I am afraid some of it is not. We should be glad to send you the book you ask for; but "Harris on the Pig" is worth \$1.50, and we give only 5-cent books for little letters.

CHARLIE'S REPORT.

One summer I found a swarm of bees on a black-berry bush, and my papa said I might have it; and from that one I got another swarm, and in the fall I sold them to papa for \$5.00, and in the winter his bees all died but one swarm. My sister had four swarms of bees, and she sold her bees and honey, enough to amount to about \$37.00, and papa put money enough with it to buy her an organ.

CHARLES GILMORE, age 12.

Georgetown, Wis., Feb. 20, 1884.

Well, Charlie, I should think you sold out to your papa in just the right time, did you not? Your sister's case illustrates how any young miss who wants an organ may get one; and if I am right about it, Charlie, I believe your sister appreciated it a great deal more for having worked for it, than if her papa had paid for the whole.

MYRTLE AND SADIE.

Pa has 23 hives of bees. He winters them in the cellar. We got about 1000 lbs. of honey. The bees did not do very well last year. I wish you would put your baby's picture in GLEANINGS, so we could look at it. I wish you would send me the Giant-Killer.

MYRTLE SCARLETT, age 9.

Papa says he is going to have me for his bee-girl. I used to catch bees, and play with them. Once I caught a black bee, and it stung me.

SADIE SCARLETT, age 7.

Anita, Cass Co., Ia., Feb. 22, 1884.

Why, Myrtle, I should be very glad indeed to have Huber's picture in the journal, but the engravers say they can not make good pictures of babies. Babies are so bright and sparkling and vivacious, that it would be like picturing a bird on the wing, almost, to get a good picture that would do them justice. May be I will try, however, when he gets a little older.

HOW TO RAISE TOMATO-PLANTS.

It is a better plan to raise early tomato-plants in small paper boxes than egg-shells, for the roots will have more room to grow. Cut a piece of stiff paper (a paper flour-sack is good) 5 in. square, then double up one inch all around. Double the corners in and tack with a needle and a thread, then fill with good rich mold, and one seed of any kind in a box; set them on a board, and keep in the sun, and water well.

LULU E. GORDON.

Melvin, Ford Co., Ills., Feb. 21, 1884.

IRA'S EXPLANATION FOR THE CAUSE OF ABSCONDING.

Grandpa and I had 10 colonies of bees; but one of them came out yesterday, and united with one of Uncle Billie Sistrunk's, as ours and his are in the same inclosure. I think their mamma must have died and left them, and they couldn't keep house without her. Our bees are busy working on the alder-blooms.

IRA MITCHAM.

White Sulphur Springs, Ga., Feb. 11, 1884.

Your explanation is quite ingenious, friend Ira; but if I am correct, bees as a rule never desert their hives unless the queen is with them. Don't you think it was because they got out of stores and could not keep house?

5-YEAR-OLD CORA'S LITTLE LETTER.

I HAVE A LITTLE SISTER, AND I HAVE TO ROCK HER TO SLEEP. I WILL PUT THIS IN WITH MY BROTHER'S. IF THIS IS WORTH A BOOK, PLEASE SEND ROBY FAMILY. SEND MY BOOK WITH MY BROTHER'S.

CORA.

To be sure, your letter is worth a book, Cora, but you did not tell us where you live, and I am afraid our clerks were so careless that they let your letter get away from your brother's, and now we do not know where to send the book. Will you please tell us where you live?

My pa has three stands of bees. I will tell you how we got the first one. Ma and I stopped it as it was flying past our house one year ago last summer. It swarmed four times last summer; three we hived, and one got away, and one of them has since died. It was a small one, and the moths got in it; but my pa says if he had had his A B C book sooner, he thinks he could have saved it. Since he has it he reads in it nearly every night. He says he did not know the first thing about bees, and would not part with his book for any thing, if he could not get another. I should like to see little Blue Eye's. I have a little sister with big blue eyes too.

ANNA M. GARBER, age 10.

Cazenovia, Ill., Feb. 13, 1884.

I am glad your papa likes his A B C book, Anna. I suppose this next little letter is from the little blue-eyed girl you tell about.

LETTER FROM ANNA'S BLUE-EYED SISTER.

I am going to school, and have been going ever since I was three and a half years old. I have a spelling-book and slate, and my teacher says I must get a Second Reader. I wish I could draw Huber around in his little wagon.

NORA M. GARBER, age 6.

Why, Nora, do little girls go to school at three and a half years of age in your State? I wondered at such a nicely written letter for a girl six years old. Here in Medina they will not let them go till they are fully six years old, and Caddie is just commencing to

go to school this spring. Does it not make you tired, my little friend, to go to school and study, as young as you are? Your little letter is written better than half of the letters we get, and we receive hundreds every day. Now let Uncle Amos advise you and your parents. Do not study too much, nor very long at a time. Go out and run around and play with the bees and the flowers, and take care of that little body of yours, and those precious blue eyes that God gave you.

HOW TO MAKE GINGER-SNAPS; BY ONE OF THE JUVENILES.

We have no bees. Mr. Ames has about 8 stands. He gets about 60 lbs. of honey. I will tell you how to make ginger-snaps. Two cups of molasses, one teaspoonful of ginger, one of soda, and a little milk. Put the molasses and ginger in a pan, and set it on the stove until it boils, and then put in the soda, and put enough flour in to make it stiff. Roll the dough thin, and bake in a quick oven.

Feb. 20, 1884.

MARY RHOADES, age 11.

Well, Mary, very likely that recipe is a good one; but if you had managed some way to have some honey in it, it might have been a little more appropriate for a bee-journal. It is all right, however, and it is very well well done for a little girl only 11 years old.

A JUVENILE PEN-PICTURE OF A HOME CIRCLE AWAY DOWN IN TENNESSEE.

Brother received his wire and expansive bit on the 9th. Neighbor R. brought our mail. It was dark when he called at the gate for brother to come and get a hoop and a rattle-box he had for him. Last summer he told brother he had a coffee-pot somebody had sent him by mail. It was a smoker. Well, papers, letters, and all were laid by to see the bit. Brother opened the box carefully, putting the extra bit in his vest pocket. Now, to try it we had queen-cages at hand, so down on the carpet we went, mother to hold the lamp; brother, papa, and I each must bore a hole. Then we must try the other bit; brother felt in his vest pocket; no bit, but a hole. Brother's eyes are black, and way in his head; but, Uncle Amos, they looked mighty white and close by just then. Such a hunt as we did have on the carpet, in his pockets, in his boots. Papa went for the sand-sieve to sift the ashes in the fireplace, when brother happened to see he had a watch pocket, and in it a bit. If you could have seen us, and not heard us, it would have been a funny sight. Brother has lost 3 stands; 2 were queenless. Bees stay outdoors all winter about here. Brother's bees are raising brood; will soon have young bees flying. It has been very cold this winter. The thermometer stayed 12° below zero almost two days. Lots of people had ears, toes, and fingers frost-bitten. One man had one side of his nose bitten.

LOUIS E. TRICE.

New Providence, Tenn., Feb. 11, 1884.

AN ESSAY ON BEES, BY A JUVENILE TEN YEARS OLD.

Bees are divided into swarms, or families. Every swarm must contain one queen, several thousand workers, and a few drones. The queen-bee is the mother of the family. She is longer than any of the other bees, but in other respects her size is between that of the drone and worker. In shape she resembles the worker more than the drone. She has a sting like the worker, but she uses it only to kill other queens. She has a very little hair about her

head and trunk, which gives her a dark shiny appearance. Her wings are about the same length as the workers. She seldom leaves the hive without leading the swarm.

WORKERS.

All the labor for the family is done by the workers. They are provided with a sack in which to carry honey. On their legs are little baskets, in which they carry the pollen to their house. They are provided with a poisonous sting. They will not use it when not disturbed; but when you bother them they will be sure to make you feel the sting. They fly over fields to gather honey and pollen. They secrete wax, build combs, prepare food, take care of the young, bring water for the use of the family, and they seal up all the crevices about the hive, and they act as guards to keep away the robbers.

DRONES.

The number of drones in the swarm depends on the size of the family and the yield of honey, more than any thing else. Where there is a large family, and lots of honey, the drones are numerous; but as the honey gets scarce they are killed by workers. They have large clumsy bodies, covered with short hairs. When they fly, the buzz of the wings is louder and altogether different from that of other bees. Bees are very industrious. When there are flowers, and the weather is nice, they always do their part in gathering the honey. When they fill their hive, and we give them more room, they will fill it too. Rather than to be idle, they build combs outside of their hive.

HINDS SWIGGETT, age 10.

Allerton, Ia., Feb. 12, 1884.

ESTHER'S APPREHENSIONS.

Pa has not gone into the bee business yet, but I wish he would. He gave me a bed of sage last season, and I think the proceeds will get me one stand of bees. They (that is, pa and ma) make light of my apiary. But we will see; time will tell. Suppose I can, with my apiary, get more honey than I can sell, I do not know what to do with it then, unless I could find some person who would purchase it at wholesale.

ESTHER A. FREDLEY.

Silver City, Iowa, Feb., 1884.

Why, my little friend Esther, did you never hear about counting chickens before they were hatched? You have not only been counting yours, but you have been worrying about what to do with them, and yet you have not any chickens at all—or, rather, you have not any bees or honey. Our good old friend Abraham Lincoln used to say that he always made it a point never to cross a bridge until he came to it. If I am correct, one of the smallest troubles bee-keepers have is to know what to do with their honey after they get it.

LETTER FROM A LITTLE GERMAN FRIEND.

I feed the little birds still with crumbs; but if it is too cold and snowy to feed them, they come to the windows and say, "Why don't you give us our dinner?" but, of course, in their own language. If I were there I could talk with your Dutchman. I can read German, for my aunts taught me. I am reading the Bible through. I am in the second book of Moses.

EMMA E. MILLER, age 8.

Lewisburg, Union County, Penn., Feb. 11, 1884.

Well, Emma, if you were to come here now, I suppose you would find a great many to talk to. We have now five all together,

who could not talk English at all when they came here. Two little boys came last summer, and wanted work when our garden got to be pretty weedy. I set them at it, and they looked as glad as could be while they lifted their little German caps and thanked me. And then how they did go to work! When school commenced they worked for us only nights and mornings. But last week they were looking sad about something; and when asked, said their father could not send them to school any more, they were so poor, and he had no work. I told them to go right off to school, and tell their father to come down here; and I tell you, he does work, too, as only the German people know how to work. Yesterday our pastor was inquiring who the two little boys were who sat right before him, and were so attentive, and behaved so nicely. "Why," said I, "they are my little German boys, and they can hardly understand a word of English!" Now, children, although they could not understand, they were more attentive than most children who knew every word the minister spoke. I wonder if some of the good friends over in Germany could not teach us (Americans) some good lessons, if we were willing to receive them.

LEORA'S EXPERIENCE IN SCRAPING OFF THE SECTIONS.

I often clean the sections for papa. On page 100 you say the section is as clean as when it left the saw-table. If they are, the Medina bees are more cleanly than Suffolk bees, for here they always have the sections waxed around the edge. A good many bottom-bars will sag, and they will be waxed to the center. Papa built a bee-house, made a door in back end, and two swing-doors to prop up on each side—one for the lower row of bees, and one for the upper row.

LEORA FAYLOR, age 10.

Suffield, Ohio, Feb. 14, 1884.

Thank you, my little friend. You have struck on a point of considerable moment just now. I know the bees will put propolis around the entrances of the sections, more or less, and I do not know how we can prevent them. It certainly makes the honey look nicer to have this scraped off; and I guess, since you mention it, that little girls are just the ones to do it. I know bees often get propolis away over on the outside when the bottom-bars sag, or when the sections do not fit nicely in the wide frames. There has been some talk about remedying this matter by bracing the bottom-bars, or by making them heavier. If made heavier it would take more room in the hive, and they would then be larger than the brood-frames. If the wide frames are made reversible, as has been lately talked about, that might possibly remedy the difficulty. Very likely some improvement can be made right here in order to keep the bees from gumming up the sections; and it is a fact, that, even after they are scraped, they do not look as nice as they did before any thing was put on them at all. I have thought of covering the sections with paper, and then peeling it off before it was given to the customer; but this would be expensive, and the bees would pick at the paper also, whenever they came near where they could get at it.

HARRY'S REPORT.

My papa had one swarm of bees, and he got four more swarms from it that year, but did not get any honey. The next summer, from the five swarms he got 31 swarms, and 500 lbs. of honey. Last spring he had 30 swarms, and he got 23 new ones and took 2300 lbs. of honey last summer. My papa raises small fruit.

HARRY F. GILMORE, age 8.

Georgetown, Wis., Feb. 20, 1884.

I had a swarm come out June 24, and they worked well for about two weeks, and then I noticed they were not working; and as they were in a box hive, I could not do anything but watch. They filled the hive about half full, and then they seemed to just sit there and cover it. It stood there about two months in that condition, and in that time the bees were all, or nearly all, gone; then I opened the hive and found about 30 lbs. of as white honey as I ever saw. About two inches deep on every comb, the cells were filled about half full of some kind of light-brown sticky stuff. There were no queen-cells nor drone-cells nor worker-cells, nor any indication of there having been any brood raised at all. Can you answer my questions, and tell me what was the matter with my colony of bees?

Joliet, Ill., Jan. 30, 1884.

CASSIE A. EIB.

Friend Cassie, your bees had lost their queen, was what made the trouble. The light-brown sticky stuff you mention was pollen, or bee-bread. It is used by the bees to feed their young; and as they had no brood, it accumulated in the hive. Probably the queen got killed when they were first hived, or very soon after.

BLASTED HOPES.

You can put me in Blasted Hopes this time, for I did not get any book when I wrote to you before. Well, I am in for one now, as I inclose a sketch of uncle's style of rustic hive, and he thinks his are the only ones of this kind in the world, so I am sending you at least something new in apiculture. You will notice that this rustic hive is made of six pieces—a bottom, four sides, and a top. The sides are held together by eight little pins passing through the ends of the cross-bars, to which the front and back are nailed. These cross-bars are two inches square; there are 4 two-inch auger-holes in each of the end-pieces, to receive the ends of the cross-bars. Two colonies can be packed in each rustic hive, and the advantage of making them this way is, that they can be taken apart when spring comes, and piled up in a stable, or any other building, thus getting rid of the unsightly structures that we sometimes see about our apiaries.

W. J. MILLER.

Horning's Mills, Ont., Can., Nov. 27, 1883.

A HEAVY HIVE.

My grandpa has 7 swarms of bees. They have wintered very well so far. We were looking at the bees the other day, and we saw a comb that the bees had worked out. The hive was so heavy that grandpa could hardly lift it. He said he was going to transfer them in the spring into the Simplicity hive; and if they did well, he would give me one. We take GLEANINGS, and grandpa got your A B C book.

Homeworth, O., Feb. 21, 1884. HARRY R. LEE.

Friend Harry, very likely the bees that filled that hive and made it so heavy could have filled it three or four times, if the honey had been taken out with an extractor, or

if room had been given them in sections. The great secret of modern bee culture is, that it always permits all the bees to work, while with the old plan they crowd their hives with honey until there is no room to raise more young bees, and then they stop work right in the very most valuable part of the season, oftentimes.

ABOUT CUTTING A BEE-TREE, AND SOME OTHER THINGS.

My father has four hives of bees, and one swarm in the woods. He was trying to cut the tree down, but it split in two. He got a little honey, but he had to strain it before it was good to eat. He left them there, and a tribe of boys came and fired bullets into the swarm. Before winter came they had quite a lot of honey. They have lived comfortably. My father makes his own hives, frames, honey-boxes, and smoker. He has four Italian queens. He bought them before winter set in. This winter he found out that the old bees came out and died. They hatch the young ones before they come out. My father fed the young swarm sugar this winter. He packs the hives with chaff. The bees in the summer get so hot they come out and alight on the front of the hive.

When they swarm they all fly in flocks till they reach a branch of a tree, then they stay awhile. Sometimes they go off before anybody sees them. My father sets me to watch when he thinks they are going to swarm, then I run to the shop and tell him. Then he comes home and takes a veil and smoker, then goes and smokes them, then cuts the branch, and restores them to a new hive.

Cambridge, N. Y.

FRANK B. STARR, age 10.

Well, that is a pretty good letter, Frank. The bees fly in "flocks" when they swarm, do they?

A COUPLE OF LETTERS FROM OREGON.

Our bees are out to-day, carrying in pollen, as in mid-summer. We have tapped several maple-trees, and have got a good quantity of sap from them. Papa takes GLEANINGS, and I like to read it. He has a good many stands of bees, and a good many cattle; he has one sick cow, and has to doctor it.

EDWARD PALLIES, age 12.

Mehama, Oregon, Feb. 1, 1884.

We are having fine weather—the finest winter we have had since we came to the Cascades. It was so hot to-day that the bees were flying everywhere. They were packing in pollen, and visited the maple-trees we had tapped. Father has 25 stands of bees. He just got a lot of things this winter from you.

VINE-MAPLES, AGAIN.

The woods are full of vine-maples around our place. Every time we cut one the sap runs out like water. Have you ever tried boiling it down? We are going to try it. Father has 500 acres of land for his bees to roam over. He had about 3 acres of big alders cut down before he began to keep bees. The honey-dew was very thick on the leaves this summer; and where a leaf curled up there would be a teaspoonful. I see all young writers tell how much stock they have, so will I. We have 22 head of cattle, 3 horses, 125 goats, 150 sheep, some pigs, etc. There are a good many deer around our place. Sometimes one comes and lies down on the hill and "picks his teeth." But you are not allowed to kill them.

JOSEPH PALLIES, age 16.

Mehama, Oregon, Feb. 2, 1884.

Our Homes.

By this shall all men know that ye are my disciples, if ye have love one to another.—JOHN 13:35.

THE matter before us to-day, dear friends, was suggested by three little words in our "Kind Words" column of a month ago. The three little words were, "We be brethren." Many times since reading them in that letter, have they come to mind, and always with a pleasant feeling. Sometimes in shaking hands with a Christian brother I have repeated them, "We be brethren," and every time I have repeated them they seemed to have a new power and a new significance. The three little words seem to give me a lift upward, as it were, and a sort of nearness to my fellow-men, and, at the same time, a nearness to God. Is it not a fact, friends, that when we get near to each other we get nearer to God? The little words, "We be brethren," indicate Christian fellowship; and what a grand thing is that Christian fellowship!

Yesterday the superintendent of our Sunday-school informed us that our subscription that day was between seven and eight dollars, the greater part of which goes to the building of the Morning Star steamship. I presume many of our readers know that the Sunday-schools of the United States are contributing, with the end in view of building this steamship. When I first came into our Sunday-school, I heard talk among the people about the Morning Star; and on inquiry I learned that the Sunday-schools of this country had built a sailing vessel for the exclusive use of the missionaries who are constantly going to and from the mission fields among the remote islands of the sea. Somebody showed me little printed papers, which were the certificates of stock. These certificates of stock were only ten cents each; but then there were Sunday-school children enough to build a great vessel capable of navigating the waters of the entire globe, and the dimes saved up by the children did it all. The mission work has now, however, assumed such proportions that a sailing vessel is inadequate to the work. Oftentimes the missionaries are kept away from their fields of labor by inconvenient calms in those tropical seas. A larger ship is needed, and one that goes along by steam. Why should not the work of reclaiming savages go by steam as well as all other great enterprises?

A year ago or more the matter was talked over, and some apprehension was felt that the Sunday-schools of the world were hardly equal to the task of such a great enterprise. I said at once I *knew* we could do it; and the news came yesterday that the sum of \$25,000 was already paid over toward the \$45,000 that was wanted altogether. The contract for building her has been let, and it is to be ready to start out upon the broad ocean by the first of next September. Certificates of stock are to be issued and sent around to the Sunday-schools, of 25 cents each.

At the close of our Sunday-school, one of our prominent business men arose and asked if these certificates of stock were liable to assessment. The reply came quickly, "Yes,

sir; ten cents a year, to cover running expenses." Somebody else got up and replied, "Yes, sir; mission work is going to last as long as the world lasts, and we expect to be assessed, and thank God for the opportunity and ability to help in this work, so long as we live."

Other remarks followed, and the impression left, as the matter was dropped, was a most grand and glorious one. We, the Sabbath-schools of the world, infantile, juvenile, boys and girls, men and women, including the old and gray-headed, were all working, rejoicing with the love of Christ as the central and impelling thought of Christianizing and civilizing the world. United as one family we have, during the past few months, simply by each and every one bringing in his pennies, already raised \$25,000, and who has felt it? The secret of it is, that we have pulled all together; the thought that has been with us and through us, and all along the line, is the same thought I expressed a little time ago—"We be brethren." The world will look at that grand steamship as she moves among the fleets of the world, and ask what it is for, and how it came; and the answer, in whatever shape it comes, will be to the effect, "By this shall all men know that ye are my disciples, if ye have love one to another." You see, this ship indicates, dear friends, not only that we have love to our near neighbors, but that we have love to the savage and pagan tribes away off in the remote corners of the earth, and that our love to them assumes a type not unlike, although it may be a faint semblance only, of that love which prompted the Father to send to earth his only begotten Son. "For God so loved the world, that he gave his only begotten Son, that whosoever believeth in him should not perish, but have everlasting life."

Many a Christian parent has indeed already sent sons and daughters to these savage tribes; and when they have gone, it seems to me a great joy, even though mingled with pain, has come into their hearts that they have been able to make even such a sacrifice for the Master's sake. They do not go now as they did a few years ago, with such great probabilities that they will never return, because, thanks to the Morning Star and other vessels, they have now opportunities for making visits home again in a few years, or of returning to recruit, after the trials and hardships of a new climate and a new world, as it were. In this very number our friend Bess has given a vivid idea of the need of mission work away off in Alaska.

Now, friends, we are not going to let things suffer here at home because of these enterprises, and we are not going to lose by any means in thus scattering our money, and sending our bread away off on the wide waters. Our pastor told us yesterday that the Sandwich Islands had contributed toward this steamship the sum of \$1500 of the \$25,000 already raised. A few years ago I told you something about the Sandwich Islands. Is it indeed so, that they are able and willing, in these few short years, to do so much toward fulfilling the commandment of the Master, "Go ye out into all the world, and preach the gospel to every creature"?

I have been astonished to note how greedily the children drink in every word in regard to the story of the Morning Star, and her mission through the seas. The boys of my class, although not ordinarily interested in any thing in regard to missions, listened with breathless silence to my account of this work; and at its close declared with almost one voice, "Mr. Root, we can do it, we know we can do it; just give us a chance, and let us try; and when we have got the ship built and paid for, it shall be *our* steamship." They are right, friends. It will be ours, because it belongs to the Sunday-school. Now, all this is done, and much more can be done, simply by heeding the voice of the Master, and showing to all men that we have love to another, that "we be brethren;" that we do not stop to inquire what church it is, what denomination, what minor differences of opinion, but that, with light hearts and happy faces, we go down into our pockets, and say, "Here is the twenty-five cents. Go on, and build the steamship." Now, friends, you see what we can do unitedly. Suppose every man worship God "on his own hook," to use a common expression, how much would it amount to? How many steamships would the same number of people build, if they held aloof from each other, without meeting every Sabbath to compare notes, talk over experiences, and profit by mutual sympathy and encouragement? What can one man do all alone by himself, any way? And yet I meet hundreds of Christian people who say that they love God and love the Bible, and yet they belong to no church, attend no Sunday-school, and, please do not think me uncharitable or harsh, if I say grope in darkness, and go through the world grumbling and finding fault with things and people about whom they know comparatively little.

I have often thought humanity was much like the bees in a hive; united, and standing side by side, they are a power, and can defy almost any evil; but a single bee, off in the fields alone, is almost as helpless as any other insect. When I used to raise queens in small nuclei, say with two frames two or three inches square, I found I could handle these little miniature colonies almost as I would handle flies. You see, there were not enough of them to show fight. Let them get to building up, however, until they filled two stories of a full-sized hive, and then we would find it was quite a different matter, although in both cases it was precisely the same worker-bees, and the progeny of the same queen. Now, friends, it is the same with humanity in almost any undertaking. We can not hold aloof from each other, and distrust each other, without suffering. "We be brethren;" and woe betide us when we forget it.

A few years ago an elderly gentleman called on us to see about having some bee-hives made. He had a new system of bee culture, and a patent hive, all his own. Although quite intelligent on matters in general, and well along in years, I was astonished to find him almost entirely unacquainted with modern bee culture; and still worse, he was so set in his own way that he declared that, with

his system and common bees, he could get more honey than any bee-man of the present day. He also declared that he could remove this immense crop of honey from the bees without getting a single sting the whole season through, which none of us could do. I attempted to explain to him his mistake, but he would not listen. I asked him if he had made any such great yield as he told us about. He admitted that he had not, but said he had not had proper opportunities. I urged him to test his theory with a few hives, but he insisted on demonstrating to the world his superior way, by building two pretty good-sized house apiaries. The outsides were painted with all the colors of the rainbow, to guide the bees to their respective domiciles. If I am correct, he did not even use movable combs in his improved system. He held aloof from bee-men, and would not even read the journals, or attend conventions. And, by the way, friends, I want to say here in a sort of parenthesis, that I do most warmly indorse and recommend conventions, even small neighborhood conventions, especially where the spirit of them is in the line of which we have been talking—"we be brethren." Well, this friend of whom I have been speaking, told all around what he was going to do; made everybody stare and look at his peculiar structures; paid us quite a sum of money for the hives and fixtures, and yet failed in all, if I am correctly informed, without ever getting any honey to mention. In fact, I am not sure that he got a single pound. I protested when he gave us his orders, and told him his project could not help being a failure. I reminded him that we had seasons every now and then that gave almost no profit; but he stubbornly declared that bees always made honey when managed on his plan.

This is a sad story, friends, but it all came about because he would not be one among the bee-keeping brethren. He would not profit by the experience or advice of others, but held himself aloof, and in a lofty way, as it seemed to me, declared his knowledge and judgment superior to them all. Now, when we profess to love God, to love justice and truth, and yet stand aloof from the great bodies of our fellow-men who are working unitedly, are we not much in the attitude of our poor mistaken friend?

It has seemed to me of late as though one could not know God, could not feel after him and find him, unless he was in close communion with his brother-men. Still further, I have thought that one of Satan's most ingenious wiles was in the line of persuading us that all mankind is corrupt and dishonest, and that we alone are pure in heart. When Satan can get us into the attitude of looking at neighbors in a jeering sort of way, and saying, as we witness their failures or weaknesses, "There goes your pretty Christian," he has got us pretty well under his thumb. How much better is the attitude when we feel like extending a brotherly hand to one who is going astray; and while we do so, feel in our hearts, "We be brethren." I know I am at fault, dear friends; I know that I have been wrong in this matter of conventions, right in this line.

Our good friend Professor Cook has taught me some lessons here, and I pray that God may help me to have more of the spirit that he carries with him wherever he meets throngs of people; that spirit that seems to speak to all men these little words I have repeated so many times to you in my talk to-day, "We be brethren."

Just now there is considerable talk about the adulteration of honey. The world accuses bee-men of putting glucose in their honey, or of feeding it to their bees; and we feel sad as we see how deeply rooted is the prejudice. I have sometimes remonstrated with those who made unkind remarks, in this line: "Why, my friend, he is your neighbor. Do you not know him well enough to know that he wouldn't sell you sugar syrup, and call it honey?"

The reply has often been, "Why, to tell the truth it did not seem as though he would do so; but then, men will do almost any thing for money nowadays."

You see, even this last clause, friends, indicates still that want of charity. Is it true, that men will do almost any thing for money? Will *you* do any thing for money yourselves? If not, why do you speak of others in that way. O ye of little faith in your fellow-men? Why not accept the great truth so plainly apparent, that the world averages about as well as you and I average, and that it is not very likely the world at large would be guilty of many things that you and I would be ashamed to do. In our haste we often accuse our grocer, or our dry-goods merchant, or butcher; yes, and even our doctors and perhaps ministers, of selfish motives, when we would blush at the thought that we ourselves could be guilty of any similar thing. How often does the Bible enjoin more love and more charity; more forbearance, and to this end a better acquaintance with each other! When you hear somebody speak ill of another, just try asking him the question, "My friend, have you been to this brother and stated the matter to him as you state it to me?"

"Why, no; I have not, for it would not be a bit of use."

"Well, my friend, suppose you *try* going to him and stating the case in a neighborly way."

I am sorry to say, that people are generally so averse to doing this that they can seldom be induced to do it. I confess it is very hard for me to go thus to a person when he has tried and vexed me, and tell him frankly all about it. But of late I have been forcing myself to do just this. *Forcing* is the word, for it is so against the grain, as the expression goes, that I can not well do it without forcing myself; but when I have done it, a blessing has invariably followed. I have always been surprised, *every time*, to find that the case was not nearly so bad as I had got it into my head it was, and that there was very much more good in that individual than I had formerly supposed. The work in our jails is characteristic of this. Four men are now in our jail for attempting to rob a safe. I understand they were armed to the teeth, and ready to commit murder, if necessary, while doing their work; but they were

induced to give themselves up, simply by the force of numbers. So many people were gathered to the spot, and had surrounded them, that they saw resistance was useless.

Now, although my soul recoils at such an act, and although it was a hard task for me to think of going there and talking with these men, yet when I became well acquainted with them my feelings of indignation were turned a great deal to pity and sorrow. It is the old story, and whisky was the cause of it all, indirectly if not directly; and while we decide that the good of the community demands that these men should serve out their time in the penitentiary, the thought comes home to me, that you and I, and all of us, are to blame, at least somewhat, for permitting whisky to be sold at an open bar in this land of ours. It is an easy thing to have love one to another, friends, or love to our neighbors, if you choose, where these neighbors are trying to do right. But suppose they are *not* trying to do right, what then? Suppose you have a neighbor who lies and steals, and is robbing you at every opportunity, then what? Human nature says, "Get away from him, and let him alone." But Jesus says, "Love ye your enemies." And again, "Do good to those who hate you, and pray for those who despitefully use you."

Perhaps you think I do not know how hard it is to do this. I have preached it and talked it for these seven or eight years; and yet when I think of it, when it comes right up before me, when I feel myself called upon to do good to those who are deliberately trying to wrong me, I sometimes feel as if about all my poor weak human nature was capable of was to breathe that old silent prayer, "Lord, help!" I love those words. I love to feel them welling up involuntarily when the still small voice sounds out that quiet warning, "Look out, my child; danger is near." Oh how many times have I stood still and breathed that little prayer, "Lord, help!" and how many times, too, dear friends, has the help come speedily! Peace and quietness at once begin to come into my heart, and very soon afterward, feelings that are wrong are driven out, and kindness and love have taken their place. Yes, even love for those who hate me; love for the sinner, even though I feel disgust at the sins. It is in this line that the Bible has been so precious to me. It is in this line that I have been lifted over trials and troubles, and have been enabled to feel hopeful, even during my most vexing cares. Where else in this world shall we find such counsel, and where else shall we find such strength and help as in the Bible, and in studying the word of our Lord and Master?

A few days ago I got to thinking it over, and the thought welled up within me, that the proofs of the divinity of this Bible and the Christian religion had been so great in these seven or eight years past that I felt surer of it than of any thing else earthly. I do not know, dear friends, that the sun will rise to-morrow; but I do know that the pathway I have been toiling in since I accepted Christ as my leader, is the right one. The evidences lie strewn all along through

this changed life, so thick and plain that I should be *insane* to think of deserting it for the old life. I can not explain in words how these evidences have come, or why I can say, with such perfect assurance, "I know that my Redeemer liveth." It is not only that it has been proved and tried every day of this new life, but there has been a progression and a stepping upward week after week and month after month, until it seems as if I could look back along that pathway and see the starting-point down those many steps, *away* down, to a point where I shudder and tremble to even cast a look back at. There is a little verse which I want to quote you in conclusion, that seems to sum it all up. But before I quote it I want to ask you to please remember that I am human. Do not take me for a standard, dear friends; do not judge of Jesus by the poor way in which I have succeeded in following him. If you knew where I was once, and how I have been helped by the grace of God, up and away from that place, my life might show differently to you, and perhaps you would make allowances for some of the old evil that hangs around, and is lurking there still. Now, the beautiful text that I have in mind, and that I want to give you as a bright beacon-light to your pathway is this:

The path of the just is as the shining light, that shineth more and more unto the perfect day.—Prov. 4:18.

Tobacco Column.

HOW FIVE BROTHERS WERE INDUCED TO GIVE UP TOBACCO THROUGH READING GLEANINGS.

MY brother Jeff takes GLEANINGS, and keeps bees. He has 11 hives. They all wintered well, only one hive died. He feeds them on corn-cobs, with sugar. I like to read GLEANINGS, and the letters in it. I want you to put this letter in the Tobacco Column, as I have been using tobacco for 12 years, both chewing and smoking, up to last May, when I quit chewing and commenced smoking excessively until I saw so much about it in GLEANINGS, when I concluded to try to see if I could not quit the use of the weed altogether. I have not used it in any form since last December. I had four brothers who used it, but after I stopped, they have followed my example, and none of us use the weed now. You are the one who caused us all to stop using tobacco, and I don't want the smoker, but would rather give you one. I may write to you again some time. Kiss little Peter for me.

FRANK S. WERNER.

Riverside, Texas, Feb. 18, 1881.

May God bless you, boys, for your efforts in the right way. You can not imagine how much good it does Uncle Amos to hear of your determinations for the right. And, Frank, I want to thank you especially for your concluding words, and for saying that it is not because you want a smoker, but because you thought it was right to give up a bad habit. Thanks, also, for remembering little Huber, for that is what we call him now, instead of Peter.

ANOTHER STORY OF DELIVERANCE FROM TOBACCO.

Now about smoking. Don't be afraid. I am not going to apply for a smoker. After 35 years of heavy seasoning with tobacco smoke, I quit using it, now close on to 7 years ago; but I trust from much higher and nobler motive than being *paid* for doing right, by one of my fellow-men, however good and kind his intentions. Your endeavor, dear brother, to assist any poor slave to break his chains, and rise to the position of a *man*, is a good and noble one; but I could not receive pay from you or any one else for your trying to do me good. Am I wrong? During my 35 years' experience as a smoker (I never *chewed* tobacco), you may be sure I often heard and read and argued on the tobacco question, but never succeeded in convincing myself that it was either good, useful, or cleanly, although completely enslaved by it, yet thinking all the time I could give it up, if I wanted to. After a while I did want to, and tried, and learned my weakness. I tried tapering off, so as to weaken the craving by degrees; *failure*. It must be all, or nothing. Often did I resolve that, when I had used up what I had on hand, I would buy no more; failure again. By the time my supply was exhausted, my good resolutions had vanished, and I was still a confirmed smoker. But, how did you give it up? I will tell you. A great many years ago I realized the claims of the Lord Jesus on me, and gave my heart up to him, to be guided and molded according to his will. During a pretty long life (now close on to 63 years) he has led me on through sunshine and storm, joys and sorrows; many times he has had to use the rod of discipline to bring his wayward child back to the path; he has taught me the depth of the meaning of the loss of the firstborn, that I might understand a little of *God's* love in giving his only begotten. To-night I can say *Ebenezer*. About eight years ago I was much exercised in my mind about my coldness of heart, and an intense longing came over me for a higher walk and closer communion, and for days the burden of my prayer was, "Dear Lord, make me more like thyself; bring me closer, closer, that I may truly know what it is to walk with God." One day as I was praying, the Holy Spirit (for I can attribute it to nothing else) flashed into my mind the thought, "What inconsistency! professing to follow Jesus, praying to be like *him*!" Could I for one moment bring *him* before my mind's eye, going about on his errands of mercy with a pipe or cigar in *his* mouth? That, sir, settled the tobacco question for me, and my cry was, "Blessed Jesus, thou wast *pure* while here on earth; thou *art* pure; oh make me *pure*! strengthen me with thy strength for the combat, for thus only can I conquer this habit," and I now record his faithfulness. He heard and answered, and I have learned this lesson: That I for one can not be a consistent follower of Christ, and continue to be a smoker. Some say the battle is easy. I found it quite the reverse. I had been accustomed to smoke, the first thing after meals, 2 or 3 times between meals, and the last thing before going to bed. I did not throw away pipe and tobacco in disgust, but cried mightily for deliverance from the appetite for it. For three days I was so restless I hardly knew what I was doing; then the reaction set in, and for three days and nights I neither ate, drank, nor slept. Thanks be to the Lord, he sustained me through it all. Not unto me, O Lord, not unto me, but unto thy great name be all the praise. Let me not stand in my own strength, for I still love the smell of a fragrant cigar.

Forgive me, if I have wearied you with my tedious scrawl. I have not written this for publication (as I have no desire to see my name in print), but partly because one loves to tell a fellow-traveler what befalls us by the way, and partly to suggest the thought suggested to my own mind, that the love of Christ introduced into the heart of a man is the surest ground to work upon for a thorough reform. It is not probable that we shall ever meet on earth; but if, in the overruling of Providence, you should ever visit this part of the world, we should be most happy to give you a hearty welcome.

F. CLARE.

L'Original, Ont., Can., Feb. 1, 1884.

Friend C., I do not know but I have taken a little liberty in disobeying your orders; but letters like yours have so many times proved helpful to other struggling brothers. I could not but feel that you would be willing to give it, if it would help any poor soul. Therefore I have asked you to give in your testimony for Christ's sake, and for others' sakes. May God be praised for the victory you have won. Thank you, too, for your very, very kind words, my brother.

About three years ago a copy of a certain bee-publication came into my hands. I was interested very much in certain articles contained therein, and one was in regard to the use of tobacco; another was the Merrybanks story, and I induced a friend to subscribe, and afterward I also became a subscriber. I still was interested in these articles about tobacco; the more so, as I was myself a slave to the filthy habit (why not call things by their right names? *it is a vice*), and had been so for perhaps fifteen years. Well, after a while (perhaps before this too) the editor, A. (No.) I. Root, offered to give to any one who would quit, a brand-new bellows smoker; and about one year ago I thought I would try to quit. How well I succeeded you can judge when I say that I have not made use of a penny's worth since, and I thank my God, whom I endeavor to serve and obey, who will aid all who come to him aright, that I am a free man, so far as this vice is concerned. Did I have a struggle to obtain this mastery? Sometimes it seemed I just could not stand out any longer. I was nearly down with nervous prostration; some of my friends almost advised me to commence again. To some I said, "I will die first." I was a great deal in the company of those who did use it, and some would say, "Here, take a chew; I know you want it." At other times some friend I would meet in town would say, "Here, have a smoke." To all, I said "No," and meant it too.

Little boys, never let this habit get such a firm hold upon you; but rather in its stead, get the love of God in your heart, and there is not much danger then.

Did any of you ever know of a Christian learning to use tobacco? I did not. Last Sunday at our Sabbath-school a class of rather small boys (part of them) so lost sight of all propriety as to chew tobacco in the house of God, and spit upon the floor to such an extent that it ran quite a way upon the floor, and their teacher, a young lady of refinement, had to move away from in front of them. Some, perhaps, will say that a great many families get their living by raising it; and if all would quit its use, that an important branch of agriculture would go down. The ground that will raise tobacco would also raise corn; and by the looks of the empty corn-

cribs through this part of Ohio, it would certainly be best after all.

Well, boys and girls, do you think friend Root sent me a smoker? Yes, *half a dozen of them*, but—I paid him for *every one*. After all it was not the inducement held out, of a fifty-cent smoker, that caused me to quit, or that enabled me to hold out afterward; nor do I want one now; but if he thinks there is one due some of you, tell him of some poor old father or mother who has bees, and tell him to send it to such as a surprise.

JACOB GUISSINGER.

Stanley, Ohio.

That is a good talk, friend G. Now, then, who will tell us of some poor old father or mother, as you state, to whom I shall send a smoker, instead of sending it to you? That will be in the line of Christ's work exactly. Just here I want to emphasize a thought presented by the brother who wrote the letter before yours. How would Jesus have looked while on earth, using tobacco? And is it not true, dear friends, that the attitude a young man assumes when he commences to smoke, indicates clearly that the state of his heart is one away from Jesus?

GLEANINGS IN BEE CULTURE.

My help cometh from the Lord, which made heaven and earth.—PSALM 121:2.

WE will pay 10 cents apiece for the July No., 1883.

UNTIL further notice we will furnish a good quality of beeswax for 33 cents. It will be shipped from St. Louis.

OLD BEE-BOOKS.

GEO. NEIGHBOUR & SONS send us a list of toward 100 old bee-books which they offer for sale. Among them we find Huber, translated in 1806, 1808, and 1821. Any one may get the list by writing to George Neighbour & Sons, 149 Regent St., London, England.

If any of the friends in the South have any dollar queens to spare, we will pay \$1.25 each for one or two as a sample, if you can get them here alive. We will get them out of the mails, and into a warm place just the minute they arrive. This offer holds good only till our next issue, and I wouldn't try more than one at a time for the present. Our bees are all alive yet; but the tug of war comes this month and the next.

REVERSIBLE FRAMES.

A GREAT number of communications have been received on this subject, and quite a number of models. Many of them are frames at fixed distances, which I told you was about out of the question, and others are old devices, some of them having been illustrated in GLEANINGS. I do not believe it worth while to spend very much time on this matter just yet, friends. Mr. Heddon has an article for our next issue that covers the ground pretty thoroughly.

CHAS. KINGSLEY, of Benton, Bossier Parish, La., Guyton Bros, Waco, McLennan Co., Texas, and D. McKenzie, Carrollton Station, New Orleans, La., are now ready to ship untested queens.

GLEANINGS TYPE FOR SALE.

We offer for sale the type GLEANINGS is now printed on. We have about 200 lbs. of the nonpareil, or small size, and 150 lbs. of brevior, or large size. For the whole lot we would take 20 cts. per lb. The small type is, of course, worth more than the large, but it has been worn more, so we make the above offer of the lot right through, and we should consider it a bargain. You can tell how good it is by looking over our pages.

NO. 36 TINNED WIRE.

You will see that a mistake has been made in quotations on this size of wire, and the price hereafter will be as follows: On spools containing about $\frac{1}{4}$ oz., 5 cts. each; 45 cts. for 10, or \$4.00 per 100. Price of the wire in coils, 5 cts. per oz.; 35 cts. per lb.; or in coils of from 5 to 10 lbs., as it comes from the factory, 28 cts. per lb. As it is extremely difficult stuff to handle, we have to have a higher price by the ounce or single pound.

DECLINE IN THE PRICE OF WIRE CLOTH FOR QUEEN-CAGES.

By purchasing in very large quantities, we have been enabled to reduce the price to 3 cts. per sq. ft., or rolls containing exactly 100 sq. ft., \$2.75. If wanted by mail, 3 cts. additional per sq. ft. This wire cloth is made dark blue, with 12 meshes to the inch, and is the best thing for queen-cages, or for hiving bees for shipment, putting up nuclei, etc. It is made in three different widths—24, 30, and 36 inches. But at the prices we have given per 100 feet, each roll will be all of one width.

SENDING BEES AND QUEENS LONG DISTANCES.

LETTERS are coming again this spring from Australia, New Zealand, and the Sandwich Islands, to say nothing of California, Oregon, and other remote points in our own country, for queens and bees. Now, dear friends, we could probably prepare them to go these long distances, and get there alive; but I do not believe it will pay either you or us to undertake it. The queens and bees in our apiary are probably not one whit better than those you can obtain probably not very far from your vicinity. I say this with the understanding that there are good Italian bees in all these points; in fact, articles from these places indicate as much.

PASTEBOARD BOXES FOR 1-LB. SECTIONS OF COMB HONEY.

This box has a bit of "red tape" attached to it to carry it by. It makes a safe package for a single section of honey for the consumer to carry, or it can be packed in a trunk, if he wants. It can be opened in an instant. The price of the box is 2 cts. each, set up; in the flat, 15 cts. for 10; \$1.25 per 100; or \$12.00 per 1000. Colored lithograph labels for putting on the sides, two kinds, one for each side, \$3.50 per 1000. They can be sold, labeled on one side or both sides, of course. We have only one size in stock, for Simplicity sections. Sample by mail, with a label on each side, 5 cts. If you want them shipped in the flat, labels already

pasted on, the price will be one cent each additional, for labels.

EXTRACTED HONEY.

Our friends will notice by the market reports, that only 7 and 8 cents is now offered for extracted honey. Now, while we are not prepared to buy honey in large quantities, I will say this: Until further notice I will pay 8 cts. per lb. in trade for a nice article of either basswood or white-clover honey, delivered here. This is a small price, I know; and if you can do better, I shall be very glad to have you do so. The offer is made mainly for those who want supplies, and have not money on hand, but who have honey. Before you ship, send me a small sample by mail. I will furnish you a block to put it in, on application. I will also furnish you iron-jacket cans to ship it, where it is not in barrels or suitable packages.

CONVENTION NOTICES.

The Bee-Keepers' Association of Central Illinois will hold its next annual meeting in the office of the County Surveyor, in the Court-House in Bloomington, on the second Wednesday of April.

W. B. LAWRENCE, Sec.

The Mahoning-Valley bee-keepers will hold their next meeting in the town hall at Newton Falls, O., Thursday, April 10, 1884, at 10 o'clock A. M. A cordial invitation is extended to all.

L. CARSON, President.

E. W. TURNER, Secretary.

The Central Michigan Bee-Keepers' Association will hold its semi-annual meeting at Lansing, in the Pioneers' Rooms, in the State Capitol building, April 15, 1884, at 10 o'clock A. M. All are cordially invited to attend. Any one having any new apiarian implements, or anything that will advance the interest of the association, is requested to bring it; and if not convenient to bring it, then send it to the secretary, and he will place it on exhibition.

REV. J. ASHWORTH, Pres.

E. N. WOOD, Secretary.

CIRCULARS RECEIVED.

H. H. Brown, Light Street, Pa., sends out a 20-page circular of bees, queens, extractors, etc.

Friend Muth sends out a single-leaf list of prices on extracted honey in barrels, kegs, and jars.

H. Alley sends a leaflet explaining his drone and queen trap; also giving notice of reduced prices.

W. T. Stewart, Eminence, Ky., sends us a one-page circular devoted to L. hives, bees, queens, etc.

Simon P. Roddy, Mechanicsville, Md., sends out a 2-page circular, devoted especially to queens and bees.

B. Davidson, Uxbridge, Ont., sends out a 4-page circular, devoted to hives, honey-extractors, etc.

Wm. Balantine & Son, Sago, O., send out a circular devoted to bees, queens, hives, and apiarian supplies.

Sheldon & King, Independence, Iowa, send out an 8-page circular, devoted principally to hives, fans, and extractors.

W. B. Stone & Co., of North Lansing, Mich., send us an 8-page circular, devoted principally to hives, section boxes, and cases for the same.

H. F. Shadolt, Winoski, Wis., sends us a very pretty 12-page price list, chiefly devoted to Simplicity hives, as we gather by looking at the pictures.

The Hiawatha Bee-hive works, Hiawatha, Kan., send us a neat-looking 4-page circular, devoted principally to Simplicity hives and apparatuses.

O. Clute, Iowa City, Ia., sends out a large 4-page circular in regard to bees, queens, nuclei, honey-extractors, etc.; also the terms on which instruction is given.

J. A. Osburn & Son, Spring Bluff, Wis., send out a single-leaf circular, devoted especially to Simplicity hives, bees, and silver-hull buckwheat. It is from our press.

Byron Walker & Co., Capex, Mich., send out a very instructive circular in regard to one-piece sections. The remarks in regard to a combined rack and case are worthy of note.

S. Valentine & Son, Hagerstown, Md., send out a neat price list of 12 pages. Their specialty is albino bees. As they have quite a list of testimonials, we judge albinos seem to find considerable favor.

LADIES! For \$2.50 you can use a new attachment that fits any machine; and it has turned out a bed-quilt in less than ninety minutes. C. R. MITCHELL, Agent, Box 102, Hackinsville, Ga.

"BOSS" ONE-PIECE SECTIONS

We have again increased our capacity for making the "BOSS" ONE-PIECE SECTION, and are now ready to fill orders on short notice. We would advise our customers, and especially Supply Dealers, to

ORDER EARLY,

And not Wait until the Rush Comes.

We will not manufacture Hives and Shipping Crates this season, as we have fixed over all our machinery for making the One-Piece Sections.

J. FORNCROOK & CO.

WATERTOWN, Wis., Dec. 1, 1883.

6-7d

Honey. ✱ Honey.

Great quantities of it, and great quantities of choicest fruit from new Cuthbert raspberry. I have locally found a good thing at last. It is the largest and best red raspberry grown; so say those who have tested it, and so say I. Will stand heat or cold, wet or drouth. Have tested it now for two years, and am really surprised at the quantities of honey gathered from the blossoms; and that, too, when but little is gathered from any other source; bees continue to work on them four weeks.

I make more money from the crop of berries alone, than from any crop grown on the farm. A limited quantity of fine plants for sale; 1½ doz. for \$1.00 by mail, or \$3.50 per 100 by rail.

4-6d DR. B. F. KINNEY, Bloomsburg, Penn.

MISSING,

From Kenner, La., Fred S. Carrier, who was in the employ of E. T. Flanagan at that place, 16 miles from New Orleans. He left indications of mental derangement, and it is believed that he has either perished, or is wandering among strangers. He was one of Mr. Heddon's last year's students—a bright young man, of then sound mind; about 5 feet 8 inches in height, rather slender built, weight about 140, smooth face, nervous sanguine temperament, eyes bluish gray, hair dark brown. A little peculiarity in his walk was a hitch in the steps, as if there was a stiffness across the small of the back, though he was strong and well, with no such weakness. He was well versed, and very enthusiastic regarding bee-culture. Will any person who may think they have any clue to the whereabouts of the above-described person, please report the same to James Heddon, Dowagiac, Mich., or E. T. Flanagan, Kenner, La.?

POTATOES.—Ontario, St. Patrick, and Magnum Bonum; 1 lb., 20c.; 3 lbs., 50c.; by Ad. Ex.; by mail, 20c. a lb. extra.

6d C. WECKESSER, Marshallville, Wayne Co., O.

EARLY BEES!

BEES of all kinds at prices to suit purchasers, at all seasons of the year.

After July 1st, almost given away.

5tdb A. W. CHENEY,
Kanawha Falls, W. Va.

Basswood Sprouts,

FROM 1 TO 3 FEET HIGH.

\$1.50 per hundred; \$10.00 per thousand. All orders should be in before April 1st, 1884, to receive attention.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with *, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

DADANT'S FOUNDATION FACTORY, WHOLE-SALE AND RETAIL. See advertisement in another column. 3tdfd

Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little barrels to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

CITY MARKETS.

CINCINNATI.—Honey.—There is no life in the market. Extracted honey sells in a regular way, and in its wonted channels, without any speculative feeling about it. It brings 7@10c on arrival. Comb honey sells slow at 15@16c for choice from store. *Bee-swar* is in good demand, and brings 35c for choice yellow.

CHAS. F. MUTH,
S. E. Cor. Freeman and Central Avenues,
March 24, 1884. Cincinnati, O.

KANSAS CITY.—Honey.—The recent concession in prices has brought orders in quite freely, and stocks are much reduced. Choice white comb, 1 and 2 lb. sections, bring 16 to 17c; extracted in good demand at 8 to 10c.

JEROME TWICHELL,
Mar. 21, 1884. Honey Depot, 514 Walnut St., K. C.

ST. LOUIS.—Honey.—Our honey market continues very dull, with no prospect of improvement. Only a retail demand for comb honey at 14 to 16c per lb. for small packages in good order. Broken combs, 10c. White clover in good condition, worth 20c. Extracted very dull, and only small retail demand. Worth in barrels, 6 to 7c; in small cans, 9 to 10c, retail. *Bee-swar*, 5. Not much arriving. Yellow, 35 to 36½c.

W. T. ANDERSON & CO.,
March 22, 1884. 104 N. Third St., St. Louis, Mo.

MILWAUKEE.—Honey.—At this time the honey trade is dull, and sales light for choice white, 1-lb. sections, 15@16c; 2-lb. sections, 14@15c; 2-lb. sections, poor, 10@12½c; extracted, white, 9@10c; extracted d., colored, 8@9c.

Bee-swar.—Scarce, and wanted at 30@35c.
A. V. BISHOP,
Mar. 22, 1884. 81 & 83 Detroit St., Milwaukee, Wis.

CHICAGO.—Honey.—There is very little demand for extracted honey, and prices are easy at 7 to 9c. Comb honey will all be worked off, but the demand that does exist, asks for low figures. Prices range from 12 to 18c for white comb.

Bee-swar, 30 to 35 c.
R. A. BURNETT,
March 20, 1884. 161 South Water St., Chicago Ill.

CLEVELAND.—Honey.—There is no change in price of honey. We notice a little better movement of 1-lb. sections, while 2-lbs. are still slow. Best 1-lb. sells at 18c, 2 lbs., 16@17c. Second quality, 15@16. Extracted, no sale.—*Bee-swar*.—Scarce at 35c.

A. C. KENDAL,
Mar. 22, 1884. 115 Ontario St., Cleveland, O.

BOSTON.—Honey.—We have nothing new to note as regards the sale of honey. Prices are about the same, and we are trying to clean up our stock.

BLAKE & RIPLEY,
Mar. 22, 1884. 57 Chatham St., Boston, Mass.

DETROIT.—Honey.—The honey market is very dull at present, though there is a slight demand at 17@19c—*Bee-swar*.—Very scarce at 30@35c.

March 12, 1884. A. B. WEED, Detroit, Mich.

I have 2500 lbs. of white extracted honey, mostly clover, thick and nice, which I will sell, either in waxed barrels at 8 cts. per lb. or in new tin cans holding 40 lbs., for 10 cts. per lb., delivered on cars here. Small samples sent free.

C. KENDIG,
Naperville, Dupage Co., Ill., Feb. 28, 1884.

FOR SALE.—About 1000 lbs. of honey, in two iron-bound and waxed barrels—one of clover, the other fall honey from mint. How near to 10 cents do I hear, on board of cars at Muscoda, Wis.?

Orion, Wis. F. L. SNYDER.

NOTES FROM THE BRIGHT-BAND APIARY.

FRIENDS:—The last time I appeared under the above head was more than a year ago, at which time, as some will remember, I laid much stress upon the superiority of my queens. Well, now for the result: Quite a number of queens were sold, and the next season (which was last summer) still a greater number were sold; in fact, I had orders for more than I could raise; consequently I have removed from my old place (Greenville, Tenn.), to this place, that I might raise earlier queens, and have facilities for raising a greater number of queens. I can now command 500 colonies in the queen business, if necessary. My intention is to produce queens not excelled by any. Price, untested, but laying, in April, \$1.40 each; in May, \$1.25 each; 90 cents each the rest of the summer. Tested queens, in May, \$2.00; the rest of summer, \$1.75. The above are from imported Italian queens; queens bred from Kingsley's improved bees, same price. Kingsley's improved bee is simply a cross between the Cyprian, Italian, and Holy-Land bees; and in reality they are ahead of any race, both for color and honey-gathering propensities. Sample live workers sent for 3c to pay postage.

All orders promptly attended to; safe arrival guaranteed; full directions sent with each queen.

Vol. XII.

APRIL 1, 1884.

No. 7.

TERMS: \$1.00 PER ANNUM, IN ADVANCE: 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY
A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

NO. 53.

SECTIONS, PROPOLIS, ETC.

FRIEND ROOT:—In my last article I said that, when next I wrote, I would review the articles on pages 226 and 285, Vol. X.; but as you have advanced nearly the same ideas in your reply to my last articles as you did upon pages 226 and 285, I do not think it necessary to go back and "rake up" those articles, so I will only reply to your remarks on page 188, current volume.

To the great mass of thinking, practical bee-keepers, I propound the question: Where do bees put propolis? Now just think a moment; for what purpose do they use it? Isn't it for the purpose of stopping cracks that they use it? Do they, as a rule, put it anywhere, except where two surfaces meet? Friend Root says that the outside of sections must be protected, otherwise they will be covered with propolis. I have just this moment left my writing, and examined about 500 brood-frames, some of which have been in use several years. Where they touched any thing, or where they were very rough, they were propolized; but where they were planed smooth, and touched nothing, there was not a particle of propolis. I also examined the inside of about 50 old hives. At the corners, or where a frame had swung against the side, was propolis; otherwise, not. If the bees of Medina put propolis upon plain, smooth surfaces, that are in contact with nothing, they behave differently from the bees of Rogers-

ville. Now, if brood-frames and hives that have been in use for years are free from propolis, except where two surfaces meet, why should we expect the smooth surface of sections to become propolized at those places where they touch nothing, when they seldom remain in a hive more than a month? When sections are put into wide frames there is a crack all around each section; or, in other words, two surfaces meet all around both sides of each section, while in the Heddon case the top and bottom bars of the sections touch nothing, except at their ends; hence they remain entirely free from propolis, except at the ends. Upon this point I am not obliged to depend upon theory, for I know, from experience, that, except where they touch something, the sections remain entirely free from propolis. If sections could be aerially suspended, exactly bee-space from each other, they would remain entirely free from propolis.

Considerable has been said of late in favor of "continuous passage-ways" in the surplus department; but I should object to them. When placing one tier of sections upon another, bees would be crushed, while the top and bottom bars of the sections would be glued fast to the sections above and below them. If there is nothing between the sections and the brood-frames, the bees, by means of brace-combs, not propolis, will connect the top-bars of the frames with the bottom-bars of the sections; but the Heddon slat, or skeleton honey-board, most effectually prevents this. When the Heddon cases are tied up, the sections in each case are exactly bee-space from those in the case above or in the one below, and there are no brace-combs built between

the cases of sections, and no propolis placed upon the top and bottom bars, except at their ends.

I want no case with slats to support the sections. The bees will put propolis along the edges of the bottom-bars of the sections where they rest upon the slats. The width of the sections can not be varied, without taking out the slats and changing their widths and positions; and it would be difficult to remove the sections, while the slats might sag under the weight of the honey.

In regard to side storing versus top storing, it appears to me in about this light: If you squeeze an orange, the juice must go somewhere; and if you squeeze (contract) the brood-nest until the queen can keep it full of brood, the honey must be stored "somewhere" *outside* of the brood-nest; and if there is no space at the side, it is of necessity stored above; and by tiering up, there is no difficulty in giving all the room that is needed. But let us suppose, for the sake of argument, that a little more honey can be obtained by the side-storing method, would it not be more profitable, and *very* much more pleasant, to put a few more bees in the apiary, and then adopt the simple top-storing, tiering-up plan, which comes the nearest to running itself of any system with which I am acquainted?

W. Z. HUTCHINSON.

Rogersville, Mich., March 21, 1884.

I know there is great difference in locality, in regard to this matter of propolis, friend H.; but I did not know there was a locality where bees brought so little that it would not injure smoothly planed wood. Perhaps you would say that the varnish with which they cover the inside surface of both smooth and rough work is not propolis; but in our locality it is a substance that discolors the wood, and renders the sections unsightly and unsalable; and more than that, they very often daub their propolis, too, all over the smooth surfaces. During the height of the clover season, sections may be taken off as soon as sealed, so as to be almost free from this glue, or varnish; but at a special time in July, during the basswood bloom, or about the time it closes, they begin to bring in propolis in enormous quantities, daubing the quilts, enameled sheets, sections, brood-frames, and every thing else, in such a way that, when you go to handle a hive, your fingers often get stuck together so you are almost deprived of the use of them. This surplus propolis is not confined to Medina, either; for I have seen it in different States, and bee-keepers have written about it in almost every State in the Union. Still, I know there are localities where comparatively little of it is found. If the brethren are content to have sections put on their tables after the bees have traveled over the woodwork and varnished it, by all means let them do so. We seem to have got to the matter at last, that, with the Heddon system, we must dispense with separators (or make a separator for each single section, which I should say was not to be thought of), and also consent to let the bees varnish over the bottom-bars of our sections.

Away back in 1876, the plan of supporting sections in the way Heddon does, was described and illustrated (see page 4, Jan. No., 1876), and a good many of us adopted it quite extensively. In our own apiary we

used it two seasons. It was then abandoned, as I supposed, by universal consent, because so much scraping had to be done on the bottom-bars of the sections. The arrangement figured there was by folded tin; but Mr. J. E. Moore, of Binghamton, N. Y. (see page 82, Apr. No., 1876), gives us full directions, with bill of stuff needed, for making the Heddon crate, using strips of Russia iron instead of tin. About a year ago friend Heddon sent us a slatted honey-board to be used under the sections, and this might be used in combination with the plan of supporting mentioned above; but I should consider it rather too much machinery. I know there are those who still persist in using this old and abandoned idea; but I have always thought their locality did not abound in propolis as ours does, or they would not use the arrangement very long.

In regard to being able to vary the width of sections: After we once decide on the proper width, I can not see any very great reason for having different widths. Still, it may be easily accomplished with the wide frames, for we can make these any width we choose. With the combined crate we can also have any width we choose by replacing the bottom-bars with such a width as seems desirable.

In regard to side and top storing, perhaps it may be best to take a rising vote on it, as it were. Suppose somebody prepare a table containing the names of the great honey-producers of the land, and see how many have discarded side storing entirely. These are momentous questions; for not only do bee-keepers want to know, but manufacturers of hives and sections would be very glad indeed to know how they should make their hives and sections to offer the greatest advantages to honey-raisers. It might be well, however, in considering these questions, to take a view of the ground that has been gone over in the back volumes of our bee-journals.

WIRING FRAMES FOR FOUNDATION.

ALSO SOMETHING ABOUT A MACHINE FOR DOING IT.

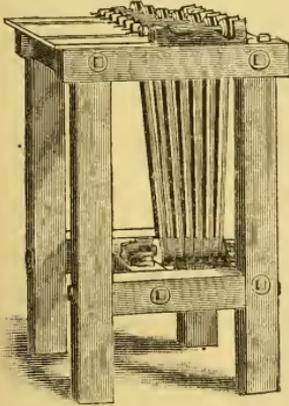

IT is wonderful, what a general turning there has been toward wired frames. It is but a short time since the idea was first suggested, and now the custom has become so universal, of having all brood-frames strengthened by wires, that only yesterday we sent an order to the wire manufacturers for a whole ton of No. 30 tinned wire. When we first began to wire combs, plain iron wire was used, and it was very soon reported that the bees disliked the wire; and where larvae rested against it, the action of the food on the wire produced rust, killing the larvae. Very soon, however, C. R. Carlin (the same friend who gave us the foundation-cutter) suggested that we use tinned wire; and in just a few weeks, reports came from right and left that the tinned wire worked all right, and that good healthy bees were hatched right on the wires. That the coating of wire may be perfect on every inch of it, the ton we are having made now is to be double tinned. The wire is beautiful to look at as it comes in coils from the factory, shining like burnished silver. As the coat-

ing is pure tin, it is not acted on by any of the juices or acids that may be found in the bee-hive. After one set has been hatched in the cells, the wire is protected by a thin silky cocoon; and then it is, to all intents and purposes, just like any natural comb.

Some discussion has arisen in regard to the size of the wire. While No. 36 is used by the Given press, we have decided that it is altogether too light for our combs. For almost every comb in our apiary is liable to be shipped, perhaps clear across the United States, and therefore we want it secure enough to avoid any possibility of breaking down. While No. 36 wire broke quite often, we have never yet had a case where No. 30 has broken after it was put in the frames. Quite a number of experiments have been made to determine how many wires should be put into an ordinary L. frame. Our decision has been that it requires just about seven wires. If a tin bar takes the place of the central one, only six wires are needed. We find the tin bar a necessity to prevent springing the top and bottom bars toward each other; and then with the diagonal wires to prevent any possibility of sagging, it seems to me we have it about complete. In the cut in our price list, the spaces are all equal—that is, the wires are set the same distance from the end-bars they are from each other. As this necessitates fastening the fidu. to the end-bars, which is somewhat troublesome to do, we now bring the outside wires within one inch of the end-bars, spacing the whole of them a little further apart; in practice we find it holds the foundation perfectly.

The question now comes, How shall we fasten the wires in the frames? Many devices have been suggested and used, as our readers are aware; but we have found nothing so cheap and simple as drilling holes in the top and bottom bar, by means of the machine shown below:

MACHINE FOR PIERCING TOP AND BOTTOM BARS OF BROOD-FRAMES.

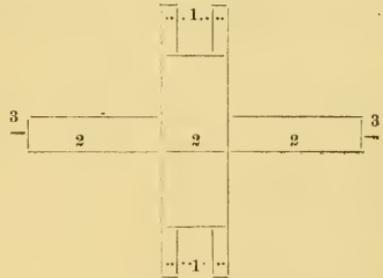

Seven small mandrels are arranged side by side in an iron frame. Each mandrel has a chuck in the end, for holding a drill. When we first made the machine we used ordinary twist drills; but as a great many got broke, we were surprised to see that a steel wire nail flattened like a common

brad-awl, would drill just as fast as a twist drill, and if broken, the expense was nothing. These mandrels are run by seven belts from an iron pulley, or drum, below. The drive-pulley, for attaching power, is not

shown in the cut. The operator sits at the left of the machine, takes a bundle of bars in his fingers, and lays them on the ways in front of the drills. They are then crowded squarely up, and four or five are pierced at once. Where the tin bar goes, a drill is used slightly larger, although not large enough to let the end of the bar go through. This larger hole guides the girls in putting the loop of tinned wire through it, and it also facilitates slipping the tin bar in just where it is wanted. (See page 238.)

Perhaps more than one of our friends have had some experience in getting this fine tinned wire tangled up. If your time is valuable you might as well throw the tangled coil away and buy a new one. The coil should be unwound on a pair of swifts, or something similar. Here is a letter, just at hand, from a friend who tells how he does it:

Speaking of wire on spools, I don't like it. If you have ever told us how to manage a pound of wire without snarling or kinking it, I have not heard the sound of your voice. With my little reel I can un-reel a pound without a kink; and the many pounds you send out to persons who have not much knack and no experience with the "frisky critter," you should send a reel, or instructions for keeping it inside of a 10-acre lot, at least. Below find a sketch of mine:

TOWEL-RACK REEL.

A piece of 1/2-inch pine, 11 inches long, 2 1/4 wide, forks cut as at 1; pass a 2 1/4 wire nail through a large thread spool at the dotted line; after, you slip the 11-inch piece through an axle, 2 (mine is a piece of broom-handle), with a 2 1/4 wire nail, 3, to revolve in a slot at the end of arms that may be fastened to the ceiling, or where the reel is out of the way when not wanted. Spring 1/2 lb. or 1 lb. over the spools; fasten the end of wire you don't want, and gently pull the end you do want. H. M. H.

REVERSIBLE FRAMES.

FRIEND BUCHANAN GIVES US SOMETHING FROM ACTUAL EXPERIENCE.

THE winter of 1880-'81 being the most trying on bees of any we have ever had, destroying 95 per cent of the bees of this part of the country, was preceded by the poorest honey season we ever saw. When the honey season was past, there was not an average of 5 lbs. of honey to the hive. It was thought at that time by some who had experimented with grape sugar, that it was safe fed for bees when used with syrup, equal parts, made of best granulated sugar. Then thinking this a less expensive food, our bee-keepers here fed this stuff,

which might have done in an open winter; but that winter seemed to have no mercy. Out of my 80 colonies, but 15 got through, and none of them occupied more than one or two combs before the first of May, at which time brood began to hatch. These few little squads of bees were increased that season to 70 heavy colonies, and a few hundred pounds of surplus honey.

And now comes my first experience with reversed frames. When these 15 weak stocks occupied to the full capacity the brood department, I filled the second stories with frames of brood-combs, placing these upside down, letting the top-bars of upper and lower frames come close together, thinking by this arrangement the queens would more readily go to depositing eggs in upper frames. These frames were held at a proper distance apart by a device similar to that used on frames when shipping colonies, and the frames covered with quilts. About all of these combs placed in this position lacked from $\frac{1}{4}$ to $\frac{3}{8}$ of an inch of touching the bottom-bar of frame. After the bees had gathered honey pretty freely for a few days I examined them, and was surprised and pleased to find the new order of affairs within. The combs were all built up solid inside the frames, and well fastened. All were now divided, making 30 full stocks, at once, and again these were treated as before, to a full set of frames of comb, and soon built up, and in a short time again divided, giving me 60 full colonies. By taking frames of brood and bees from these as they grew strong, another ten colonies were created, and about all my combs built up solid in frames. By this process it is an easy matter to get all your combs attached to all parts of the frame.

I like this order of things, but I am not certain that it will ever pay to make the expense of arranging the frames with reversible projections. The advantage supposed to be gained by this upending business might be more imaginary than real. True, all the honey, or almost all, could be forced into the surplus boxes; but suppose it was (by all this untimely disturbance of the bees while they are busy at work in the sections, tending to check work and confuse for a time), would the loss in honey, loss in time to the bee-keeper, and all, more than balance the little gain? That is, suppose you did induce them all to store the honey above, and take it off and get your money for it, is that all the use you ever expect to have for these bees? What will they do for stores to winter on? fill up with fall honey? Yes; but in most places none is gathered. Feed sugar to all that pile of bees? Why, that is too much work for me, and it will pay no man. Besides, if you were seen feeding so much stuff, people would get an idea that you make your own honey. Some claim that, by reversing the frames, pure Italians are induced to put their honey in boxes. Well, I will say to you, if I have got to hang about a hive of bees that must be "upset" every few days, in order to get any honey out of them, you may count me out. I don't want any of that kind of stock; but I am aware of the fact, that all lovers of bright, quiet bees have the kind that take coaxing to get them to put honey in sections, and, for that matter, *any place else*. If I had a strain of bees that was backward about storing in the upper stories, I would set about improving its "higher" intellectual power (if by no other means), by infusing a little black or German blood into its make-up. This process is inexpensive, and it will "fetch 'em" every time. I like real improvements that will pay; but when I see so much re-

versing and revising in our business, and useless devices that are only *notions* of improvements, and causing beginners and the uninitiated and unwary to "fool away" their hard earnings, I feel like sounding the alarm of caution. J. A. BUCHANAN.

Holiday's Cove, W. Va., March 13, 1884.

Why, friend B., you do not seem to be aware that you have struck upon a big thing. You have told us how we can use the frames we have got, as reversible frames, without doing a thing with them, or without adding a copper in the way of expense. After I read your letter I went and got some Simplicity hives and frames, and found they would go in upside down as well as in any other way. Another thing, putting the top-bars tight together gives us one great sheet of comb, 17 5-8 x 18 1-4. You see, the queen when she gets under way can just swing in a great big circle, skipping over double top-bars when she comes to them. The only trouble is in getting the upper story on with the frames all in. We can put in about half of them without any trouble, by just turning them diagonally as we set them down, and swinging them around into place. Your idea of the spacing-boards (figured in our price list) solves the problem, however. Take a spacing-board, and, with a saw, cut it up into strips so that each strip contains notches to slip over and space the frames. Now put the upper set of frames on with top-bars down; slip on enough spacing strips to keep them in place; now slip down your upper story, and there you are with the upper set of frames reversed. When you want to get them out, you will have to cut the attachment all around where the combs come next to the hive, and slip the hive off; then we can put them back, right side up if you choose. Now, friends, all of you can test reversible frames, without making any thing different. If a crate to hold sections is put over them, it will have to be made so as to drop down a little, because the bottom-bars are a little lower down than the top-bars usually are, the bee-spaces being filled tight between the upper and lower stories. The spacing-boards figured in our price list are not the thing, however, for they are made to hold nine frames instead of ten. If you have nine combs in the brood-chamber, however, it will work all right.

BUYING BEES IN THE BROOD, VS. BY THE POUND.

FRIEND PERRY MAKES A FURTHER DEFENSE OF HIS PLAN.

THE convenience of receiving live bees by the pound, where a person has combs on which to place them, can not be denied; and where a person has a weak swarm with a valuable queen, a pound of bees, more or less, turned in with them just sets them booming. But as transporting bees in that way is almost unavoidably attended with a great deal of suffering on the part of the bees, and consequent loss to the shipper, a more natural way of moving them becomes very desirable.

The beauty of sending bees in sealed brood, estimated by the thousand, is apparent to any one; and in pleading for this method of estimating and shipping bees, I have *not* overlooked the "important

point" of the confusion in frames. I have "racked my brain" to remedy that point, until I am sure I have it, if all parties will agree to it. Let the case be light and strong, well ventilated, and so arranged that an entrance can be easily opened at the bottom on one side, or end. Have all the brood as near the hatching-point as possible. Let the buyer place the case on his hive, with the entrance directly over the entrance to the hive; or the case may be placed in front, and close to the hive. There the bees can be allowed to fly for a few days until all are hatched, when they can be turned into the hive, and the case removed. If there is a queen with the nucleus, she should be confined by a wire screen or perforated zinc division-board, to one or two of the combs until the brood is two-thirds or three-fourths hatched, when she, with most of the hatched bees, should be put into the hive, and the case left until the rest are hatched, when they, too, can be turned into the hive, and the case and combs returned to the shipper. Thus if the buyer will order a little earlier, he can get his bees in a more compact form, estimated just as accurately, and 10 to 20 per cent cheaper, than he can by the pound; and with a trifle more attending to, he can have them transferred from the combs in which he receives them to his own.

There are circumstances under which it is far more convenient to receive bees alive and full grown, than in any other way. Therefore let us work to improve the conditions in which we ship them, by the pound, until we can send them 900 miles in the hottest weather, without loss. Still, I for one shall try to persuade my customers to take them in the brood, estimated by the thousand, whenever it is possible for them so to do. S. C. PERRY.

Portland, Mich., March 17, 1884.

Very good, friend P. Your plan will work, and I believe has been adopted, to get the brood out of the unshapely bits of comb while transferring. The objections are, briefly, as I see them, in most hives it would be difficult to find solid patches of brood all hatching about the same time. In fact, we usually find more or less unsealed larvæ along with the sealed brood. We shall have to put bees with this to take care of it, and these bees will have to stay in their shipping-boxes till the brood is hatched. If the queen is with them she will be laying all the while, and they won't want to get out. After the bees are hatched, the comb would be lost, and the nicest place for a queen to lay is in the cells left unoccupied by hatching bees, besides the loss of the brood-comb. The shipper may either cut the brood from combs from his own hives, or use little frames, both of which plans we consider bad. Let me digress a little.

When I was a boy I invented a machine to tie grain-bags. It was a piece of brass spring wire, corrugated by stringing out a coil. On each end was a small leaden bullet. Put it around a bag, slip under one of the small bullets, pull on both ends, and the bag was tied securely. It was untied in an instant by slipping the bullet under the wire, which could be done even with your mittens on. I was going to get it patented when my brother "Marsh" suggested we should look at new inventions in this way. Said he,—

"Brother Ame, suppose all the world had tied bags with your brass wire with bullets

on the end, and then suppose somebody should come along who had invented strings, wouldn't we all have considered the strings a big invention?"

The argument so discouraged me that I dropped it right there. Friend Heddon presents the same idea in a recent article. Now, I would suggest to you, suppose we had been shipping bees in the way you mention, and somebody had suggested sending a whole frame, to be lifted right out of one hive, and set right into the hive of the purchaser when received. Of course, either way necessitates a universal standard frame; and my opinion is, there is no use talking about getting along without it. In fact, we have a standard frame; for more than one hundred thousand people are using a frame of one standard dimension, and these people buy and sell and manufacture hives and frames that work interchangeably any way. Now, if you will excuse me for finding so much fault, I want to say that your idea of selling bees in the shape of sealed brood is *the way*, and we must all come to it. In fact, it is the only way we can buy and sell drones that I know of, for drones can not be shipped alive—at least, I have never succeeded in doing it.

BRUSHES FOR BRUSHING OFF BEES FROM THE COMBS.

ANOTHER IMPROVEMENT.

AFTER the notice of friend Cook's death last fall, there was quite a little inquiry for his improved brushes, and pretty soon our stock was all exhausted.

We tried several different brush manufacturers, but did not succeed in finding any who would undertake to make any such as we wanted. Several of the bee-

friends tried their hands at it, but none of them pleased us as well as the brush shown in the cut. You will notice the handle is made

DAVIS' IMPROVED BEE-BRUSH.

of galvanized iron wire. This is better than wood, for it is not injured by rain, if left lying in the grass, as many careless bee-keepers will be likely to do. Neither will the handle be broken in

two if they get their clumsy feet on them (I include myself in the above, for I am a bee-keeper, and my feet are sometimes clumsy). I tried to buy the idea of the friend who got them up, but here is what he says about it:

Friend Root:—You wanted to know what I would take for my idea. That, I will not sell. I will make you a proposition; and if it suits you, all right: I will agree to furnish you all you want, and I will not sell to any one else, if you will advertise them in GLEANINGS regularly and in your price list, and agree not to sell them higher than 15 cents retail.

Ballstown, Ind., Feb. 4, 1884. J. S. C. DAVIS.

They are made, as you will notice, in two forms. Some will prefer one, and some the other. The brushes measure about 8 inches, handle and all. Length of fiber, about 4 inches; width of fiber where it is fastened in, 4 inches; width of the brush, about 5 inches; so you see that two sweeps will cover an L. frame. In ordering, please designate them thus: "Straight handle" and "bent handle." For the present, prices will be as follows: One brush, 15 cents; by mail, 3 cents each additional; 10 brushes, \$1.25; 100, \$10.00.

The friends will observe that these brushes are made of a soft fine vegetable fiber that will roll young bees from the combs without injuring them or making them angry. If the brushes get daubed with honey, wash them in water, for neither fiber nor handles are affected by wet. As your brush is liable to get lost, I think it will pay you to have at least two or three. Have one hung up in your extracting-house, another hung up on a post in the apiary; or for a large apiary, have them hung up in two or more places. Then make every one who uses them hang them up, instead of laying them down. If you follow this up thoroughly, probably at least one of them can be found when you are in a hurry.

MOVING BEES TO CATCH THE BASSWOOD FLOW.

A GENERAL "MOVING ALONG" IN THE MATTER.

FRIEND ROOT:—After reading your encouraging remarks on my latest hobby, on page 44, I felt as though you had given us a big lift. Most all you said only confirmed the ideas I have in this matter, except in one particular. You say, "A Simplicity hive, with wire cloth over top and bottom, will do the business nicely." So they will; but to my notion, a Langstroth or lower story of the Simplicity hive will do better. For moving bees I like a solid bottom-board, because they are easier prepared, better to handle, and when you are ready to let the bees fly, it can be done in a twinkling. I have moved my bees so often that I could tell a long story from experience. I would cover the portico with wire cloth, which can be done very fast, if every thing is in readiness, as it should be. I would make the cover in the following manner: Take a Simplicity cover; have a tin top instead of the broad board. After nailing the rim together, put on the tin in such a way that it can be taken off without much trouble. This will be a cover for ventilation when the tin is off, and a tight cover when the tin is on. I think it would be an improvement, if the tin could have a slight rim turned down, say $\frac{1}{2}$ to $\frac{1}{2}$ inch deep. I will order a lot of hives from you with tin covers, to make the experiment. To get bees ready for shipment, put the spawling-boards in all the hives; cut off $\frac{1}{2}$ inch from part of them to use at the front or entrance; drive in a nail to hold

them up. When bees are quiet, nail the wire cloth over the portico; and last, take tin top off from the cover, after fastening the cover to body, and the hive is ready.

"AND THE FLOODS CAME."

It was my intention to send you this article at once; but the flood turned me so upside down that I could not well do it. In 1882 the water was three feet in my bee-yard; in 1883, 8 feet; in 1884, about 17 feet. This last was a "damper," and I got out and moved my dear ones out of the second-story window at two o'clock in the night. I tell you, friend Root, on such occasions we find out how near and dear they are to us.

GENEROSITY AMONG BEE-KEEPERS.

I was very much pleased, and I am thankful too, for the information and kind invitation from our friend George Hilton, on page 83. I think we should enjoy paying our friend H. a visit, and accept his assistance, so generously offered, to have teams in readiness at the railroad station to move our bees. On reading his article I said to myself, "Here is another whole-souled brother bee-keeper;" and allow me to say here, that in no other pursuit have I ever come across a set of men so ready and generous to give their experience free of charge to their fellow-men. With bee-keepers, generosity seems to be the rule. I have never yet found a bee-keeper who put up a notice on his workshop, honey-room, or any where, "No Admittance," or would not answer questions freely concerning the art of bee-keeping. There is, however, one thing which we would desire in regard to a location to move to, to have it, if possible, on the line of some railroad.

DOOLITTLE'S ARTICLES, ETC.

On page 160, March GLEANINGS, I noticed friend Doolittle's article on basswood. By the way, I have a peculiarity of finding friend D.'s articles in GLEANINGS almost always first, notwithstanding the strong notion I have to try friend Heddon's way of getting box honey. I have always read friend D.'s articles with great interest, and have profited much by his teachings. Well, friend D. made it all as plain as A B C, and gave us his experience of twelve years with basswood. I do not see any thing to hinder us from trying the experiment, unless it be the farm I bought last week near town. I am of the same opinion as our friend Mrs. Axell, that a man should have some occupation linked with bee-keeping, and I think a farm in grass and fruit answers the purpose well. I also indorse every word that our lady friend writes in the March number, which just came to hand.

We have as yet heard nothing from the particular field in Northern Ohio, where we thought of making the first trial. I do not know whether the field is stocked with bees so much that we would be regarded as intruders, or whether it has been overlooked. I would say this, that we expect to pay the friend for his trouble and time, who gets us a location, if we can make use of it. Are there not, somewhere between Oak Harbor and Toledo, timber tracts where basswood is plentiful? We should like to hear from the friends, either in GLEANINGS or by private correspondence.

Since writing the article in January number, another friend has come forward to join us in the enterprise, so that we shall be able to fill a car. We can get a car from here to Toledo for \$46.00, and one man allowed free; perhaps we can do a little better yet. We hereby tender our thanks to you, friend Root, and also to friends Hilton and Doolittle, for kind advice and assistance.

R. STEELE.

Marietta, Ohio, March 18, 1884.

A GOOD REPORT FROM THE WEST INDIES.

Modern Bee-Keeping on the Island of St. Domingo.

FRIEND SÓBÓTKER GETTING HONEY OF A GOOD QUALITY BY THE TON.

I HAVE been very busy taking in the honey crop, which opened here in Nov., and is still lasting, principally from the bell-flower vine, called "campanilla," or "aguinaldo," in Spanish; but in Latin, *Convolvulus monospermum*. This is the best and finest honey-plant in the West Indies. It blooms together with very many other plants producing nectar; but the bees leave all others for it, and will go very far away to get it. The honey produced from it is very heavy, weighing with me as high as 12 lbs. to the gallon, and is clear as crystal, as good, if not better, than basswood or linden and white clover of the North. It generally commences to bloom in November, and lasts up to the end of Feb., or middle of March. It grows in a wild state in hedges, pastures, and, in fact, on pretty barren land. I have been extracting from brood-chamber and second stories of 60 hives, but much more from brood-chamber, and have now on hand 500 gallons of the finest honey ever seen here in this island. Forty hives have as yet not been touched, and 36 palm loes still to be extracted, and I suppose the flow of nectar will last this month out; then comes our swarming season, and again in June, July, and August, another flow of nectar, if Providence permits it, and every thing works on as favorably as at present.

The public here are now seeing the good results of the La Fè Apiary, although the hives in themselves are not directly the cause of this; but they give their share of ease in handing their inmates, the bees.

As soon as I find the bees lying out around the entrance, it is a sign for me to alter the ventilation; in fact, I very seldom give them the chance to notify me; as practice tells me more or less when the changes are required; as surplus hives for the honey-extractor, as a second story, or even as a brood-nest for the first story, they can not be beat. I am now trying a few of them for comb honey for home consumption, and I think they will do well at that. That is, using two division-boards, reducing the brood-chamber to six frames. After all the ten frames below are full of brood and honey, this must not be touched on any account; but the surplus 2-lb. boxes are put on immediately over the brood-frames, leaving the full ten frames below. I find, generally, two frames on either side of brood-chamber, with honey alone perfectly capped over; this I leave just so during the season; and by so doing I get the bees very easily up into the surplus arrangement.

I have now taken, within the last two weeks, from one trial hive, 30 2-lb. boxes, and have the lower story, or brood-chamber, filled with say the one-half of 6 combs or frames with brood, and the top half with honey, besides 4 frames quite filled with honey, so I do not consider this a bad yield. They do as well for extracting, as I find the half of each frame in brood-chamber with brood in all stages, and the other upper half with sealed honey; and the second story, where I work with only 9 and 8 frames, I have taken from many hives, during this season, combs (Given's foundation put into frames wired), drawn out to the

thickness of 3 inches, and weighing, before put in the extractor, 12 lbs.; and after being emptied, frame and comb weighed 2½ lbs. each, leaving a net result of 9½ lbs. of the nicest honey that can be produced here.

I have been very much troubled during this busy time by visitors from our Capital here. Among the notables, the President of this Republic and his cabinet of ministers, leading planters, merchants, and ladies of our English-speaking part of the community, all very much delighted to see the progress in apiculture.

LORENZO J. DE SÓBÓTKER.

St. Domingo City, West Indies, Feb. 16, 1884.

Why, friend S., do you really mean to say that visitors are a trouble to you, especially notable ones, like those you have mentioned? This thirst for knowledge is one of the grand features of the present age, and I am sure you will find your reward in ministering to it, and treating all these friends with kindness and courtesy, which, of course, you do. You need an assistant, I should say, and it seems to me you also need to sell bee-books and bee-supplies. While you are talking and explaining, show the books, and you will, I think, almost invariably make sales that will amply pay the wages of a competent assistant. I am greatly rejoiced to find the industry so well started in the West Indies, and I look forward to a rapid growth of the industry, and a corresponding development of the trade in West-India honey, secured by means of modern appliances, of a quality equaling, perhaps, any we have in the world. Go on; and may God bless you in your efforts.

ERADICATION OF FOUL BROOD.

STAMPING IT OUT OF EXISTENCE.

WE take the following from a printed circular sent by the N. E. B. K. A. It seems to me it is the thing exactly, and I earnestly hope every State in the Union will fall in line, follow suit, and have it carried out. It would be a real kindness, also, to slovenly and slipshod bee-keepers, to oblige them by law to keep posted, and take care of their stock. It seems to me to be just in spirit with the progress of the present age; and may God help us all to do our duty in all such works of reform!

A BILL TO PREVENT THE SPREAD OF FOUL BROOD AMONG BEES, AND TO EXTIRPATE THE SAME.

SECTION 1. The people of the State of New York enact: That it shall be unlawful for any person to keep in his apiary any colony of bees affected with the contagious malady known as foul brood; and it shall be the duty of every bee-keeper, as soon as he becomes aware of the existence of said disease among his bees, to destroy or cause to be destroyed forthwith all colonies thus affected.

SEC. 2. In any county in this State, in which foul brood exists, or in which there are good reasons to believe it exists, it shall be lawful for any five or more actual bee-keepers of said county to set forth such fact, belief, or apprehension, in a petition addressed to the judge of the county court, requiring him to appoint a competent commissioner to prevent the spread of said disease, and to eradicate the same; which petition shall be filed with and become a part of the records of the court where such application is made.

SEC. 3. It shall be the duty of the County Judge, on receipt of the petition specified in section two, of this act, to appoint within ten days thereafter a well-known and competent bee-keeper of said

county, as a commissioner, who shall hold his office during the pleasure of said court; and a record of such appointment, and revocation, when revoked, shall be filed as a part of the records of the said court.

SEC. 4. It shall be the duty of said commissioner, within ten days of his appointment as aforesaid, to file his acceptance of the same with the court from which he received his appointment.

SEC. 5. Upon complaint of any two bee-keepers in said county in writing and on oath, to said commissioner, setting forth that said disease exists, or that they have good reason to believe it exists within said county, designating the apiary or apiaries, wherein they believe it to be, it shall become the duty of the commissioner, to whom such complaint is delivered, to proceed without unnecessary delay to examine the bees so designated; and if he shall become satisfied that any colony or colonies of said bees are diseased with foul brood, he shall, without further disturbance to said bees, fix some distinguishing mark upon each hive wherein exists said foul brood, and immediately notify the person to whom said bees belong, personally or by leaving a written notice at his place of residence, if he be a resident of such county; and if such owner be a non-resident of such county, then by leaving the same with the person in charge of such bees, requiring said person, within five days, from the date of said notice, to effectually remove or destroy said hives, together with their entire contents, by burying them or by fire.

SEC. 6. If any person neglects to destroy, or cause to be destroyed, said hives and their contents in manner as described in section five, after due notification, he shall be deemed guilty of a misdemeanor, and punished by a fine not to exceed fifty dollars for the first offense, and for each additional offense he shall be liable to a fine not to exceed one hundred dollars, at the discretion of the court; and any justice of the peace of the township where said bees exist shall have jurisdiction thereof.

SEC. 7. The commissioner shall be allowed for services under this act, two dollars for each full day, and one dollar for each half day, the amount to be audited by the board of supervisors.

SEC. 8. In all suits and prosecutions under this act, it shall be necessary to prove that said bees were actually diseased or infected with foul brood.

At the close of the above paper appear names of the members of the association, including L. C. Root, President; C. G. Dickinson, Vice-president; G. W. House, Secretary; A. Bacon, Treasurer.

ROOTS OF THE FIGWORT, OR SIMPSON HONEY-PLANT.

ALSO SOMETHING IN REGARD TO ARTIFICIAL PASTURAGE.

THESE, after having wintered over, can be shipped by mail almost as safely as a horseradish-root or a potato. We shall commence taking them up as soon as the ground thaws enough for them to start. Price as follows: One root by mail, 5 cts.; 10 roots by mail, 35 cts.; 10 roots by express, 20 cts.; 100, \$1.50; 500, \$7.50; 1000, \$12.50. These will, with good care, grow from five to ten feet high, and all bear blossoms from July to frost. Each plant produces thousands of the little flowrets, and each flowret will have its drop of honey sparkling in it every day. Now, friends, while we are glad to furnish you these, I feel it my duty to say that they are mostly raised only as a curiosity, unless you should purchase enough to plant an acre, and I do not believe it would pay for the labor and cultivation. If you want to raise honey for your bees, the only way to do it and make it pay financially is to sow alsike, mammoth red clover, buckwheat,

rape, honey-peas, or something of that sort, thus getting a crop that will pay expenses besides the amount of honey produced. In my opinion, alsike clover is the best and safest honey-plant known. The pea-vine, or mammoth red clover, I am not so sure of. Buckwheat is tolerably sure, but the quality of the honey is not very good for the market. Honey from rape is fair, and the crop tolerably sure, where not destroyed by the little black flea. Honey-peas have not yet been sufficiently tested. As yet, I do not believe there is any plant known that can be cultivated profitably for the honey alone.

TRANSLATION OF HUBER.

FRIEND VIALON GIVES US SOME SUGGESTIONS, AND TELLS US SOMETHING MORE OF THE BEE-BOOKS OF THE WORLD.

FRIEND ROOT:—I think the idea of making a translation of Huber's works is a capital one, and also forming a club; but I think the name ought to be "Langstroth Bee-Keepers' Club," or some name besides Langstroth, to convey the idea that it is a bee-club.

I think the best man we could get to translate the work would be our friend Chas. Dadant, as he is not only a good French scholar, but he knows the English language well. Huber's original work is probably in the hands of Mr. Dadant, or may be had from Mr. Ed. Bertrand, editor of the *Bulletin d'Apiculture*, at Nyon, Switzerland.

Allow me to correct Mr. Phin in regard to the dates of publication of Huber's works. The "Nouvelles Observations sur les Abeilles" was first published in Geneva, Switzerland, in 1792, and republished in Paris, France, in 1796. In 1814 a new edition, with additions by Huber's son, was published in Paris. A German translation was made in 1793 at Dresden, Germany; and in 1806 an English translation at Edinburgh, Scotland. In 1859 another translation was made in German by G. Kleine, at Embeck, Germany. Mr. Phin is right when he says that the number of bee-publications is over 800, of which there are over 400 in German, 200 in French, and the rest in other languages.

The first book on bees I know of was published in 1568, in German; the next in French, in 1582; and next came the one mentioned by Mr. Phin, in English, in 1592.

From 1568 to 1699 there were 25 bee-books published; and from 1700 to 1800 there were 237, in different languages, etc. If I had time I would give you a list of all, or nearly all, the works published from 1568 to 1883.

Now, friend Root, you ought to stir up this question of translating Huber into English, as I am sure it would be accepted with pleasure by American bee-keepers. I have no doubt that the steel plates could be procured from Switzerland or Paris, and I am sure that we could get all the help in that respect from our friends Ed. Bertrand and Chas. Dadant.

P. L. VIALON.

Bayou Goula, La., Feb. 6, 1884.

Friend V., I have corresponded with friend Dadant, and he says he has a copy of Huber in the original, and suggests that he might translate it for us. Another good friend sends the following:

Dear Sir:—As it seems to be your desire to have a

good translation of Huber, and myself believing that it would be a valuable addition to our bee-literature, I venture to make the following proposition: If you will consent to publish Huber in English, I will, with pleasure, translate it from the French into the English, free of charge. As I am a Creole, the French language is my mother-tongue; but I speak and write both languages with fluency and correctness. Hoping you will accept my services, I remain

Yours fraternally, NUMA C. ELFERT.

Tabadieville, Assumption, La., Feb. 7, 1884.

Does it not seem, friends, as if we were going to have plenty of help in the matter? May God bless you, my good friend, for your kind offer. Here is something more in the matter, from Mrs. Frank Benton, of Munich, Germany. As the title-page and preface are matters of great interest to us all, I presume Mrs. Benton will excuse the liberty I take in giving it here:

I see by JUVENILE for December, that you ask about Huber's work on bees. It may be interesting to you to know that Mr. Benton is translating it. He wrote to Paris last fall, and succeeded in procuring a copy printed in 1796, and has since been devoting what spare time he could to it. As I know he has not yet arranged for its publication, I would suggest that perhaps this translation may be available to you. Part of it is here, and I copy the title-page and preface, that you may form some idea of it.

Yours respectfully,

MRS. FRANK BENTON.

No. 8 Georgen St., Munich, Germany, Feb 7, 1884.

The following is the title-page alluded to by Mrs. Benton:

NEW OBSERVATIONS ON BEES.

ADDRESSED TO

MR. CHARLES BONNET,

BY

FRANCIS HUBER.

TRANSLATED FROM THE FRENCH BY

FRANK BENTON.

PREFACE.

In publishing my observations concerning bees, I will not conceal the fact that it is not with my own eyes that I have made them. Through a series of sad accidents, I became blind in my early youth; but I loved science, and I did not lose my taste for it with the loss of my sight. I had read to me the best works on natural history. I had a servant (Francis Burnens, born in Vaud) who interested himself singularly in all that he read to me: I soon judged by the reflections he made on our readings, and by the inferences he drew from them, that he comprehended them as well as I, and that he was born with the talents of an observer. This is not the first example of a man who, without education, without fortune, and under the most unfavorable circumstances, has been called by nature alone to become a naturalist. I resolved to cultivate this talent, and to make use of it some day in the observations which I was planning. With this aim in view, I had him repeat first some of the most simple experiments in physics; he executed them with much skill and intelligence, and passed on then to more difficult combinations. I did not possess then many instruments, but he knew how to perfect them to apply them to new usages; and when it became necessary he him-

self constructed the machines which we needed. In these diverse occupations the taste which he had for science soon became a veritable passion, and I did not hesitate longer to put all confidence in him, perfectly assured that I would see well in seeing through his eyes.

The course of my reading having conducted me to the beautiful memoirs of de Réaumur upon bees, I found in this work such a fine plan of experiments, observations made with so much art, and such a wise logic, that I resolved to study this celebrated author carefully, in order, in the difficult art of observing nature, to adapt ourselves (my reader and myself) to his methods. We commenced our observations with bees in glass hives, and repeated all the experiments of de Réaumur, obtaining exactly the same results when we employed the same processes. This agreement of our observations with his gave me extreme pleasure, because it proved to me that I could trust myself absolutely to the eyes of my pupil. Emboldened by this first effort, we tried to make with bees some entirely new experiments: we conceived variously constructed hives that had not yet been thought of, and which presented great advantages, and we had the good fortune to discover some remarkable facts which had escaped Swammerdam, Réaumur, and Bonnet. It is these facts that I publish in this work. There is not one of them that we have not seen and re-seen several times in the course of the eight years during which we have been occupied with investigations regarding bees.

It is impossible to form a just idea of the patience and of the skill with which my reader executed the experiments which I am about to describe. It has often happened that he has followed during twenty-four hours, without permitting himself to be distracted in the least, without taking either repose or nourishment—that he has followed, I saw, workers of our hives which we had reason to believe fecundated, in order to observe them at the moment they were laying eggs. At other times when it was of importance to us to examine all the bees of a hive, he did not resort to the operation of dipping them in water, which is so simple and so easy, because he noticed that the stay in the water disfigured the bees to a certain degree, and no longer permitted him to recognize the slight differences of conformation that we wished to note; but he took between his fingers, one by one, all the bees, and examined them carefully, without fearing their anger; it is true, that he had acquired such dexterity that he evaded, ordinarily, their stings; but he was not always thus fortunate; and even when he was stung he continued his examinations with the most perfect composure. I reproached myself frequently for having put his courage and his patience to such a test; but he took as deep an interest as I in the success of our experiments, and, in the extreme desire he had to know the results of them, he counted as nothing the trouble, the fatigue, and the passing pains of the stings. If, then, there is any merit in our discoveries, it is my duty to divide the honor with him; and it is a great satisfaction for me to assure him of this recompense by publicly rendering him justice. Such is a faithful statement of the circumstances under which I find myself. I do not conceal from myself that I have much to do in order to gain the confidence of naturalists; but in order to be more sure of obtaining it, I will allow myself to follow here a slight impulse of vanity. I communicated successively my principal observations on bees to

Mr. C. Bonnet, who found them good, and even urged me himself to publish them, so that it is with his permission that they appear under his auspices. This proof of his approbation is such an honor to me that I am not able to deny myself the pleasure of informing my readers of it.

I do not ask to be believed solely upon my word. I will tell of our experiments, and of the precautions that we took; I will detail so exactly the processes that we employed, that all observers will be able to repeat these experiments. And if then, as I do not doubt, they obtain the same results as we, I will have this consolation: That the loss of my sight has not rendered me wholly useless to the progress of natural history.

[Page 57 of Huber's Book.]

Second letter of Mr. Huber to Mr. Bonnet.—Continuation of the observations on the foundation of the queen bee.

PRÉGNY, the 21st of Aug., 1791.

Dear Sir:—It was in 1787 and 1788 that I made all the experiments of which I gave you an account in the preceding letter. They appear to me to establish two truths regarding which up to this time there existed only very vague information.

1. Queen-bees are not of themselves fertile; they become so only after mating with a drone.
2. The mating takes place outside of the hive and high in the air.

This last fact was so extraordinary that, notwithstanding all the proofs we had obtained of it, we still desired very much to—

I have compared the above with the book on Huber, sent me by friend Henderson, and it is entirely different from it. If the book is to be written in the same spirit and vein of the preface given above, what bee-keeper is there who would not want it? Now, friends, the facts are all before you. What shall we do about it?

HOLY-LAND OR SYRIAN BEES.

ALSO A GOOD WORD FOR THE SYRIO-ITALIANS.

FRIEND ROOT:—On page 81, GLEANINGS for Feb. 1, friend Green gives a description of his Syrian bees, and then asks the question, "Are they pure Syrians?" From the experience I have had with them, I can only agree with yourself in thinking they are a cross between the Syrians and Italians.

In 1882, after reading a great deal about the Syrians, I resolved to get some, and was fortunate enough to get one of the Jones imported queens. I introduced her to a colony of Italians in June; and by the time that we call our fall crop of honey came on, they were about all Syrians, and a powerful colony too. As the prospect for honey was very flattering, I expected something extra from them. So I picked out two colonies, one a pure Italian, the other what friend Heddon calls a cross between the German and Italian, to compete with them. All three colonies were as near alike, as it was possible for me to judge, in bees, brood, honey, comb, size of hive. Every thing being ready, on went the sections. The bees took possession at once. Each seemed to understand I wanted them to do their best; and as neither attempted to swarm, they soon were crowded. I gave them room by adding another case of

sections, which was followed, before a great while, by a third. Each case contained 30 one-pound sections, which, when taken off and weighed, the difference of 5 lbs. was not found between them. Neither gathered any more surplus, nor gained in body of hive. This satisfied me there was not much difference in their working capacity. I found that the Syrian queens were wonderfully prolific, and hard to find when wanted. The bees are *very* cross, and much like the blacks in running and tumbling off the combs. I believe I was stung more by this one colony than by all the rest of my 40 colonies. I resolved to replace this queen as soon as possible with an Italian.

Some time in September, in looking through this hive I found a great many capped queen-cells; and upon further examination I could find no eggs nor young larvae. I found the old queen outside the hive dead; and as she had a mashed appearance, I thought I must have injured her somehow the last time I opened her hive. As she was very prolific up to that time, I could see no reason for the bees superseding her. I cut out all queen-cells, and introduced an Italian queen. As many of these cells were extra nice, I thought I would save one and get the queen mated with an Italian drone, which I did. She was almost an exact duplicate of her mother. She went into winter quarters with fewer bees than I liked, and came out in the spring very weak, bees covering only three of my frames, $9\frac{1}{2} \times 11\frac{1}{2}$ inches, inside measure. These bees were not nearly as cross as the original stock. The queen seemed to possess the great fertility of her mother. By spreading the brood and inserting empty combs (I was careful to exclude all drone comb, as I did not want to get them mixed with my Italians), I had them ready for the boxes by the time white clover came.

It was cold and wet all through clover bloom, and we had no fall crop; still this colony made more than 70 lbs. of honey in 1-lb. sections, which was much better than some of my Italians did that were twice as strong in the spring, and all given the same attention. I am wintering the queen again. If she winters all right, I will give her a still further trial the coming season; I will also raise a few queens from her, and cross them with the Italians. This, I think, will still reduce the crossness of the bees, while the queens, I hope, will still retain the fertility of the pure Syrians, at least to a great extent. This great prolificness with some (so they say) is an objection; but I have never seen the queen yet that would lay too much for me at any time of the year. If I can get a bee that can beat the Italians in building up for the early crop of honey, and still be as easy to handle, I want it.

My experience with the Italians has been very satisfactory; but let us not cease to experiment; and if there is any thing better, let us have it, by all means. The only point I can see where the Syrians beat the Italians is in the wonderful fertility of their queens. But the viciousness of the pure race will for ever bar them, I think, from becoming popular with most bee-keepers. When the season arrives, if friend Green will take the trouble to mail me some of his bees I will return some that I know to be Syrio-Italians; then he can judge by comparison what his are.

My bees are wintering nicely so far, and are in much better condition than they were this time last year; although we have had, from the commence-

ment, steady cold weather. I think my bees are coming through stronger this spring than ever before; at least I hope so, as I want to do more in the bee business the coming season than ever before.

J. W. KEERAN.

Bloomington, Ills., Feb. 7, 1884.

WHAT SHALL WE DO TO PREVENT SWARMING?

Or What shall We Do after They Have Swarmed?

DR. C. C. MILLER'S PLAN OF MANAGING.

ONE of my greatest difficulties is—swarming. I don't know how much harm it does in the way of lessening the yield of honey, but at least it is a great deal of trouble. One of the most successful producers of comb honey I know, says he would like to have every colony he has send out a prime swarm, even if he wants no increase; and with his management it may be all right, but I should like to be able to raise comb honey and have no swarms. Failing to prevent swarming, the next important item is to know what to do when swarms do issue, and we do not desire increase. I am still studying on this problem, by no means satisfied that my plans are best, but for the benefit of the inexperienced I will give somewhat in detail what I do with swarms.

When a swarm issues, the queen is immediately caught (all my queens are clipped), caged, and placed somewhere about the hive or super (usually in the upper part of the super) where her bees can take care of her. No attention is paid to the flying bees of the swarm; they can return to the hive at their own pleasure when they find no queen is with them. In case the queen is not found, they will likely issue again in a day or two, as the queen usually finds her way back to the hive if not caught. Occasionally, however, the queen may stray off and be lost entirely, but such cases are very rare. If for any reason I do not wish to keep longer the queen of any swarming colony, she is at once destroyed. The next day after the swarm issues, or if it does not suit my convenience sooner, sometimes as late as the fifth day, I go to the colony, with an empty hive placed conveniently in front, take off the super or supers and place to one side, then take out the brood-frames, giving each frame one good shake, so as to shake a good part of the bees back into the old hive, placing each frame with the remaining bees in the empty hive. This leaves the old hive on the old stand with no frames, only some bees in it. Into this hive I put two or three frames of comb obtained elsewhere, having no unsealed brood in them, only eggs or eggs and sealed brood. These two or three frames I put in the south side of the hive (my hives face east), put a division-board next the frames, then a dummy or another division-board, leaving the rest of the hive vacant. Then the supers are replaced as they were before, and the hive which now contains the brood-frames is placed on top of all, with the entrance facing the same way as the old hive, there being no communication whatever between the upper and lower hive. I now let the queen run down between the frames among the bees in this upper hive. If their own queen has been destroyed or lost I give them another in the same way, taking no precaution about introducing. The tin tag which numbers the colony is changed from the lower to the upper

hive. In three or four days more I look to see if the queen is laying all right, although I do not know that this is essential. In eight or ten days from the time of putting up the colony, sometimes even twelve days, I lift off everything from the stand, put the hive with the queen down on the stand, put on the supers, empty out the bees from the old hive in front of the one now on the stand, and the job is done. In a few words, I put the combs with the queen and enough bees to take care of them in a new hive on top of the old one, where she can lay as much as if all the bees were with her, and after she gets well over the swarming fever put this hive down on the stand. Some one may ask whether I don't cut out the queen-cells. I pay not the slightest attention to them; the bees do it perfectly, without ever missing one hidden away in some corner, as I might do. This I consider a great advantage. The reason for putting the hive on top instead of in some other place is that the bees may all remain at the old stand when the change is made. When the hive is put down, the bees which have marked the upper entrance, after returning from the fields, try to find an entrance on top, a little cluster is formed, and soon a line of march is formed over the supers down to the entrance below. I am not at all certain but I may learn, within six months, some better plan, and discard this entirely, but at present I know of no better way. I do not know of any one else who uses the same plan, except Mr. H. W. Funk, of Bloomington, Ill., and I am sure he did not learn it from me. I should be glad to know from him if there may not be some points in which he can suggest improvements. C. C. MILLER, 172-249.

Marengo, Ill., March 5, 1884.

Friend Miller, your plan is, I should think, a good one; but you did not tell us what you do with those "two or three frames of comb obtained elsewhere." I presume likely you carried them away for a nucleus, for they would have queen-cells; and after you have waited more than ten days, a queen possibly. The idea is not particularly new, except that plan of putting combs and brood and queen on top of the regular hive. How about that empty space in one side of the lower hive, and why don't they build combs in there? or are they to be fastened out of this empty space? Will they work in a super without their queen, and so many of the brood-combs gone?

Perhaps some of our readers may ask what those figures are after your name, and I shall have to tell them it is a hobby of yours, and one which you ride pretty vehemently, for making every one tell in a few words how many bees he had the first of last May, and how many he has got now. I think it is a very good idea indeed; but unless I keep a standing notice, it is hard to bring the brethren into a way of doing it. If I put in a standing notice, where shall I put it? Perhaps right under the title to *Heads of Grain* will do; and suppose we make it read like this:

Our contributors are requested, when writing or making reports, to indicate how extensively they are engaged in bee culture, by telling us how many colonies of bees they had the first of the preceding May, and also how many they have at the date of writing. For instance, "John Smith, 25—45," means that friend S. commenced the honey season on the first of last May with 25 colonies, and that he has now 45.

MRS. COTTON'S REPLY.

ARE BEE-KEEPERS AS A CLASS, HARD TO PLEASE?

MR. ROOT:—In your issue of GLEANINGS of March 1, you state on page 169, "If Mrs. Cotton proposes to make good all dissatisfaction, we will give space for her to say so." Now, what I do propose to do, and what I have heretofore done in all cases, is this: I guarantee every thing purchased of me shall be as represented, and shall reach purchaser in good condition. If damaged in transit, I make them good to the purchaser. I guarantee that all money sent me shall reach me, if sent by draft, money order, or registered letter. I will not be responsible for money sent in ordinary letter form, neither can persons expect to have their orders filled if they fail to give their address in the letter containing their order. I hold several letters, received containing money, and no address given, and postmark on envelope so indistinct that it can not be read, so there is not the slightest chance to reach the persons who sent the money. No doubt the persons who sent the money in this form are loud in their denunciation of Mrs. Cotton, and accuse me of receiving money, and making no return for it, when the fault is the result of their own carelessness. I have in several cases received money from persons who have failed to give their address; but the postmark on envelope being plain, I have set the matter right by writing to the postmaster of that office.

The statement of James H. Dunlevy, that I cheated him out of \$20.00, as well as all other statements of like import, I brand as falsehoods, without the slightest foundation. I do not plead guilty of fraud in any form.

Now a word as to what you state about the drawings. First, you state that they are all on one single sheet of paper, or a leaf of paper. The fact is, they are on *seven pages*, and consist of sixteen separate and distinct figures. You seem to think it a fraud for me to sell a small-sized book for one dollar, or the drawings and directions for building hives for \$3.00, on such a small quantity of paper! Is it a fraud to pass a five-dollar gold-piece for five dollars? You know a five-dollar gold-piece is not as large as one silver dollar.

As regards information to make bee-keeping a success, *quality*, not *quantity*, is what is wanted.

MRS. LIZZIE E. COTTON.

West Gorham, Me., March 10, 1884.

We are very glad indeed to give place to the above, and now we hope that every one who has any complaint to make will reply to Mrs. Cotton direct, and have it adjusted. In regard to those diagrams being on 7 pages, I humbly beg pardon. They were sent to me two or three years ago, for me to pass my opinion upon them, and my impression from recollection was, that it was all on a single sheet of paper. If they have been enlarged, and more full explanations given, I am very glad. But, \$3.00 for 7 pages would be over 40 cts., which we still think is a little high for bee-books. Now, Mrs. Cotton, and other friends, I hope you will not think me forward or presuming when I suggest that the little book be sold for one dollar, including these drawings and specifications; for it does seem to me when one pays a dollar for a book on bees, this book should tell all about how to make the hives the author recommends. Mrs. C. would then rank fairly

with other writers on bee culture. I feel quite satisfied myself that her trade would be sufficiently augmented to enable her to furnish the books, drawings and all, at a very good profit at that price. Mrs. C., did you really mean to call your book *gold*, and Langstroth, Quinby, Cook, and the A B C book, by your humble servant, all of them, *silver*? Now, my friend, just one little plea here for more charity. I know that in large business houses some letters accumulate on account of improper addresses; but it seems to me the number can not be very large; neither can I think bee-men as a class are very hard to get along with. See what our good friend Hayhurst says:

Friend Root:—Please accept thanks for your kind notice of my postal circular. It does not take so very much "grace" to keep bee-keepers satisfied. I find them to be a very reasonable kind of folks. Perhaps I am so fortunate as to have none but the best-natured ones to deal with.

E. M. HAYHURST.

Kansas City, Mo., March 10, 1884.

Mrs. C., do you not see that friend H. has succeeded in pleasing customers, and he does a very large business, to my certain knowledge? How beautiful is his faith in his fellow-men! He *lives* out the sentiment of the little text, "We be brethren." Do you not see? Now, dear friend, for such I wish to call you, you can not think how much pleasure it gave me to see you here among us, and really writing an article for one of the bee-journals. But have you not been a little at fault in getting the ill will of so many of the brethren? I can take a part of this home to myself, for I have enemies and dissatisfied customers; but can we not all do a little more for the sake of peace, and for Christ's sake, if you will excuse me for using the term here?

REVERSIBLE COMBS.

IS IT NOT A BETTER WAY TO REVERSE THE HIVES?

THE articles upon the above subject on page 155 are very interesting. I have headed this article as above, because I wish to treat upon the principles of reversing both brood and surplus combs.

Our old practitioners know how many times beginners are led astray by the honest efforts of others in putting forward something new. Let us take reversible combs as an example. Of course, some one has met some disadvantages, which have suggested reversible combs as the cure thereof. Mr. Howes and others wish to make their combs stronger; prevent sagging of the top-bars; to get their honey in the sections instead of in the brood-chambers, giving the queen more room, and save necessity of extracting from the brood-combs; to have them more solidly attached for shipping purposes; to have no space between the bottom-bar and comb for the bees to lurk under, when ridding them of bees, etc. I have met all these difficulties face to face. Many of you no doubt will wonder when I tell you that the last difficulty mentioned is to-day to me of more moment than all of the rest. All of the others I have obviated satisfactorily; and now taking all in all, it seems to me that the drawbacks to the reversible-frame method are greater than all of the advantag-

es. Suppose no one had ever thought of reversible frames; suppose all frames in the past had been arranged like Brother Baldrige's and Howes'. Now, would not the first one who thought of cutting the wood top-bar long enough to rest on the rabbets, have made a valuable invention? Looked at in this light we at once discover the inferiority of the reversible frame, except for reversing.

Several have written to me, asking if I can not make my *surplus* case reversible. After studying upon the matter, I can not see how it can be done, without incurring expense, weakness, and complication of management. I have never reversed surplus combs very much; have never given it a fair practical test; but from what I have done, and what I know of the instinctive action of bees, I should expect the following:

1. If we reverse them when so partially developed that there is little or no sealed honey at the top of the sections, there will be danger in warm weather of their falling down, or lopping over sidewise, as Brother Root experienced; but suppose we wait till the case is about two-thirds completed; then if we reverse it, will the bees not do considerable uncapping, tear away some comb already built, and have a regular changing around generally, especially at all times when the honey-flow is not excessive?

Again, can we not better and more cheaply accomplish the object sought in reversing the surplus combs, in another way? The reversing of the brood-combs seems to me much more practical than reversing the surplus receptacles. I think I have a better plan for such reversion than any I have yet seen, which consists in reversing the whole hive at one movement, but a description of which would require too much space for this article. Of course, this method would require movable bottom-boards, which I much object to, greatly preferring the permanent ones. I could not think of using any frame system that necessitated the use of nails and wires, spacers, etc., to hold the frames at certain distances from each other and from the hive. We can not afford to give up the "laterally movable frame."

Let me here assert, that it is wise to keep right in the beaten track, till the experimenters are found adopting the ir new plans on a large scale.

QUEEN-EXCLUDING HONEY-BOARDS, AND NON-SWARMING ATTACHMENTS.

With the latter I have had much experience; with the former, less. With other fixtures properly arranged, I would not give two cents per hive for a queen-excluding honey-board, in the production of *comb* honey. Why should we, when, during many seasons, we do not have three sections with brood in, in the whole apiary? When producing extracted honey we should like the advantages that would accrue from keeping the queen in the lower story at all times. My experiments force me to the conclusion that we shall fail of practical success in the use of spaces too small to admit our smaller queens, if we expect our laden workers to do successful business through them.

In your next issue I will give you a description of a non-swarming attachment that has given satisfaction all around.

I think you misunderstood me regarding my criticism of Bro. Doolittle's method. I simply said I thought him behind the times regarding the advantages derived from the use of *fdm.*, and that his more ancient experiments with top storing only were much behind the methods of to-day. I do not believe

that Mr. Doolittle, with his methods, will get an ounce more honey than Mr. Shirley, Mr. Hutchinson, or myself, with my style of fixtures, if placed all in the same location. I do not see where we lose any. I was recently honored by a visit from one of America's brightest apiarists, a man of 20 years' experience and close observation—one who knows Michigan and my locality exactly; one who is also perfectly familiar with Mr. Doolittle's resources for honey; one who has kept bees near him, and he says that our opportunities for surplus honey are not to be compared to Brother Doolittle's. Brother D.'s article on page 180 corroborates my visitor's statement in part. JAMES HEDDON.

Dowagiac, Mich.

Friend H., you will recollect that I advised, several years ago, reversing the whole hive, or, at least, the brood-apartment. This can very easily be done with a Simplicity hive, and we did do it at the time, and published an account of it some time ago. Just put a strip of wood across the frames at each end, right over where the metal corners come. Brad it to the sides of the hive where the end of the stick strikes, and you are then ready to turn the hive over. If the bottoms and frames are inclined to tip, space them with a strip cut off from the spacing-board, as mentioned elsewhere in this number. There is a little difficulty in getting on an upper story; but where we work for comb honey, we do not want an upper story, unless we use wide frames instead of cases. In that case, a hive will have to be prepared before it is inverted. Surely this is less trouble than reversing the frames one at a time.

ALSIKE CLOVER; SOME ADDITIONAL INFORMATION.

CAN WE HAVE BOTH CLOVER SEED AND HONEY?

IN GLEANINGS for June, 1883, page 323, you say, in order to get seed from alsike clover, you will have to let it stand until it is pretty much spoiled for hay. Now, what I wish to say is this: A neighbor cut a field of alsike for seed, and stacked it in the field to await thrashing. The young clover came up very fine, and he turned in a flock of sheep. They stayed all winter. The thrasher failed to come, and the sheep ate the stack all up. He fed another lot of sheep on corn, to ship east for mutton, and on examination he found the lot that was wintered on the hay was the fatter, by considerable.

Now, you see that if we bee-men could get the farmers to see this, they would prefer to sow alsike in preference to red clover, as alsike is as good as a fertilizer, as it has several tap roots instead of one, and is harder to freeze out. JACOB KENNEDY.

Mont Clair, Ind., March 14, 1883.

Friend K., I am much obliged to you for the facts you furnish. Still I should want to suggest to you that my idea was to the effect that, if we let the clover get sufficiently ripe to thrash out the seed, the straw will be worth comparatively little for hay. I have just talked with Neighbor H. about it, however, and he says his sheep have always done well on the hay left after the seed was thrashed out. Now, in your case you must have given the sheep a good many bushels of alsike-clover seed, worth from \$11 to \$12 per bushel; while if the seed had been thrashed out they would have had the hay only. It seems to me that sheep *ought* to get fat on such an expensive diet as alsike-clover seed.

BEEES AND HENS.

SHALL BEE-KEEPERS HAVE OTHER BUSINESS ON THEIR HANDS?

WE think good bee-keepers have got stick-to-it-iveness enough to make good poultry-keepers. We find it a very profitable business, in connection with our bee-work; and persons who have got the real hang-on enough to make it profitable to keep bees can make the poultry business very profitable in connection with it; and then if your bees all happen to disappear wintering, you will have a good business left. Seven years ago my brother and I purchased a farm of 180 acres; became interested in bee-keeping from reading GLEANINGS loaned us by a neighbor while teaching district school the winter after. So the 20th of April, the following spring, we paid neighbor Mason \$20 for 2 swarms of Italian bees. My wife said, when I got home with my bees, "There, you have lost that money, for I never yet heard of any one making any money keeping bees."

We never have failed to make it a good paying business, though we have met with quite heavy losses in wintering. Three years ago we sent to A. I. Root, and paid \$6 00 for an imported queen; received her the 3d day of July; from that time on, during that year, we reared and sold \$105 worth of queens; lost our imported queen in wintering; have found it more profitable producing honey than raising queens, and much less work.

The past season was a very good one for bee-keepers in our locality. A year ago last fall we put into winter quarters 31 stocks, as we supposed in good condition. We lost in wintering and by spring dwindling, 15; bought enough to make our fall number good; increased to 50 swarms; took from them 4500 lbs. of the finest of honey, mostly basswood, 2300 lbs. of which we extracted. Our bees gathered honey 23 days from basswood last year; the year before, only 9. Our account with the bees for the past six years shows a balance in favor of credit column of \$950, besides the bee fixtures accumulated in the past six years, and the 50 stocks now on hand, two of which are dead.

At the time we began trying to pay for a farm, we had heard people say they had better pay 50 cents a dozen for eggs than try to keep hens; so we kept an accurate record with the 23 hens we then had for one year. They gave us a net profit of a little over \$1 per head. We have steadily increased our stock and ability to care for them, and tested the leading varieties, until we now have 350 hens, nearly all of which are pure-bred white Leghorns, and we find we can turn a net profit of \$2 per head yearly; the business requires the least attention at the time of year when the bees require the most; and for this reason we think the poultry and bee business work admirably together. In one building we have 150 white Leghorn pullets; and from these pullets, during the three winter months of December, January, and February, we have realized a net profit of \$150. These pullets were hatched during the month of May. No smoker is needed in caring for poultry.

Fabius, N. Y., March 6, 1884. KNAPP BROS.

I confess I felt a little sad at the way in which friend Hutchinson spoke of poultry-keeping a little while ago. But then, ours is not a poultry-paper; and besides, is it not the taste of the individual that decides whether it will pay or not? I love the "bid-

dies," and they have always paid a good profit, especially as they utilize the refuse from our barn and warehouse, as well as the scraps and crumbs from the lunch-room.

BEE-NOTES FROM THE BLUE RIDGE.

EXPERIMENTS IN WAX-BUILDING.

MR. E. E. HASTY, in No. 4, February GLEANINGS, gives an experiment in wax-building—a subject which is likely to attract considerable interest and experimenting in the near future by bee-keepers. His manner of testing the matter does not appear to me the best way to obtain practical results. In place of the plan adopted by Mr. Hasty, if a number of our professional bee-keepers will each have half a dozen or more first swarms on frames filled with foundation, and as many more similar swarms on empty frames with only wax starters on the top-bars, and run these colonies through the season for extracted honey, giving them credit for all they make during the season, including all that is in their brood-chambers when the time arrives for winter preparation, charging the colonies supplied with foundation with its cost, then we would have something definite as to the value of foundation. I am strongly inclined to believe with Doolittle, that foundation may easily become an expensive luxury, at the price it is mounting to. The assertions of some enthusiastic foundation bee-keepers, that foundation is worth one or two hundred per cent its cost, will, I think, prove a snare and a delusion when tested.

SUGGESTION FOR IMPROVING SMOKERS.

In one of Mr. Hasty's translations from Virgil he speaks of the ancients ejecting a spray by holding water in their mouths while blowing smoke from the smudge on the bees. From this hint, could not some of our ingenious smoker manufacturers adjust a spraying device to their smokers, which would spray the bees along with the smoke? It would require but little damp smoke to take the fight out of the crossset hybrids. Nothing will take the starch out of a bee so quickly as water.

HOW BEES WINTER IN THE BLUE RIDGE.

Bees are wintering well here on their summer stands, without any preparation other than reducing the size of the brood-chamber by a division-board to best suit the size of the colony, and a few folds of cloth over the frames, covered with a newspaper or two to retain warmth. There has not been a longer period than two weeks in which bees did not find suitable weather to fly from their hives. These frequent winter flights may cause the bees to consume a few pounds more honey, but they are kept healthy and hardy by frequent baths in the winter air. Comparatively few die in winter, or are seriously affected by the cool weather of spring, which confronts them everywhere in their first excursions in quest of honey.

MAILING QUEENS IN WINTER.

The two queens you mailed me this winter came through safely, and were introduced on Christmas morning to queenless hives, by putting them in a thimble wire cage, the upper end being closed, and lower filled with Good candy taken from their cages. Two days after, I opened the hives and took out the empty cages. I trust they are safe, as I don't approve of overhauling hives in the winter to satisfy curiosity, which is all that can be accomplished in

such matters. The bees in one of the cages were all alive, while those in the other were nearly all dead; but the queens in both were alive, and apparently none the worse for their cool jaunt in Uncle Sam's mail-bags. The weather was mild and rainy when I received them.

THE BLUE RIDGE AS A BEE COUNTRY.

While bee-keepers are hunting locations from California to Florida, it is a marvel that they do not come to the Blue Ridge of North Carolina. There are hundreds of "coves" among these mountains, where most profitable bee-ranches could be established. The best locations are indicated by the number of "gums" owned by settlers. For invalids, the higher plateaus of these S. W. Blue-Ridge Mountains, I assert without qualification or fear of successful contradiction, are the most healthful location in the United States, the summers being as cool and refreshing as the lake regions of Minnesota, and winters are mild as middle Virginia, with never a sign of mosquito or trace of malaria. There is no chill in the winter dampness, or *swelter* in the summer heat—*warmth* I should say. Another remarkable feature, these regions are never visited by violent storms or cyclones, such as surge through the lower country, and it is a rare sight to find a tree uprooted by the wind, in the mountains.

The honey-plants are numerous, and native to every season of leaf and flower. Tulip-trees, sourwood, maples, locust, and black gum abound in all the coves, and stud the mountain-sides, while huckleberry and buckberry are everywhere. All of the coves have more or less basswood, while in many this timber abounds. White clover is a native of the country, and asserts its presence in every meadow, pasture, and dooryard. Wherever the land is cleared of timber, goldenrods, asters, and other fall flowers, natives of the Middle and Northern States, spring up. On this plateau, the mercury touched zero several times this winter; but almost every week the bees could fly out. Two miles from here in a cove the bees were carrying in pollen on the 7th of February. In this country, as everywhere else, some seasons afford a light, and others a heavy honey-flow; but an absolute failure is not known. There is always a fair harvest in June and July, generally abundant, and August is the month when the sourwood comes into bloom, which is considered the great honey-tree of this country. The honey is light, and very mild in flavor. The honey I put on the market here last season was pronounced by tourists from the Northern States, the very best-flavored they had ever tried. A large per cent of the honey near old settlements will be from white clover, which generally blooms two to three months here.

Highlands, N. C., March, 1884. E. E. EWING.

PEA-VINE CLOVER AS A HONEY-PLANT AND FERTILIZER.

LIVING in a section of the country where the only surplus comb honey taken is gathered from white and alsike clover, articles like that of Neighbor H. in January GLEANINGS, on pea-vine clover, showing how the honey-harvest may be prolonged by a profitable farm crop, are of great interest to me.

Having frequently read of good yields of honey from mammoth red clover, but knowing many instances where none whatever was obtained, the

question naturally arises, whether its flowers are filled with nectar within reach of the honey-bees, only under the most favorable conditions, or whether the large red clovers, variously called mammoth, English, sapping, cow-grass, and pea-vine, belong to one or more varieties. The probability occurs, that pea-vine clover may be a variety distinct and valuable as a honey-plant.

In a paper on "Leguminous Forage Plants," Prof W. J. Beal, after describing common red clover (*Trifolium pratense*), and large red clover (*Trifolium pratense perenne*), says: "Pea-vine clover.—*Trifolium medium* (?) I have received from several sources a clover much like the red clover. It is raised in some parts of Western Michigan and in other Western States. It is known as pea-vine clover. The stalk is stout and zigzag, and the flowers later than those of red clover. Farmers usually pasture it for a while in the spring, and then let it grow for one crop of hay or seed. It seems to be *Trifolium medium*, though I am not fully satisfied in regard to the species. One of my patches has lasted for three years. It is said to be perennial."

Elsewhere he also says: "I have often studied red clover in this country, and can truly say, that in flower and stalk and leaf, this plant varies almost as much as does Indian corn. Some heads are very large, others small. Surely here is a grand chance for some one who has the skill and patience to select and perfect some improved varieties of red clover which shall be an honor to his name."

Who can give us more light on the subject? Whether or not we have a distinct variety that can be depended upon as a honey-plant, pea-vine clover occupies an important place in farm economy, as a fertilizer especially adapted to thin clay soil. For that purpose, and for rotation with wheat, it is much superior to common red clover, but requires to be managed quite differently. The following is an excellent plan:

Seed down the wheat-fields early in the spring, sowing not less than 10 lbs. per acre. After harvest, do not pasture the young clover, unless it should grow very rank, and come out in blossom. The next spring mow it off as Neighbor H. suggests. Then when it is about two feet high, or before it falls down or comes out in blossom, hitch a team to each end of a long heavy pole, as for knocking down corn-stalks, and drag it down flat, going around the field the same way your reaper will follow. The heads will rise and grow upright, and when you come to cut and save the seed you have only a few inches of long stalk to handle. The advantage of rolling or dragging it down is, that you have it all alike and without twists and tangles into which it usually lodges. It should be cut with a self-rake reaper, and small gavels thrown off into winrows. It should lie in the field until it has received two or three rains, as it will hull better, and give more seed, after being well watered, provided it is dry when hulled. The yield is usually 3 or 4 bushels per acre, but varies from 1½ to 9, according to the season. This crop comes off in good time, and leaves a large growth to be plowed under, and the ground in the finest possible condition for seeding to wheat. The following spring, clover may be sown again, and this rotation continued indefinitely, giving a paying crop each year with a small amount of labor, and improving the soil at the same time.

Scientific authorities in agriculture have lately discovered that the clover-plant should attain its

full growth and ripen its seed in order to be of its greatest fertilizing value to the soil, so this method is better in every respect than plowing under the first crop of the common red clover when in blossom, and letting the ground lie fallow until sown with wheat in the fall.

On rich clay loam soils, a similar and much more profitable rotation can be made with wheat and alfalfa clover, which, of all the clovers, is undoubtedly the best honey-producer, and, on suitable soils, the best for any purpose. B.

Neighbor H. adds the following to the above remarks:

I can indorse all that friend B. says, only that for ten years I have never known pea-vine clover to fail to produce a fair crop of honey. I have had good crops sown on oats in May. Drill the oats and throw your clover seed back of the drill-hoes. It gives it a good chance to grow on the ridge between the drills. I consider the hay better than the common red clover. If the land is very poor, sow 12 or 15 lbs. per acre; would prefer to sow the seed in April. In 1882 I raised 33 bushels of wheat on thin clay soil, without any other manure than pea-vine clover plowed under after the seed had been cut off. H. B. H.

ODDS AND ENDS.

THAT BASSWOOD YIELD.

ON page 161 of March GLEANINGS, I see friend Root is not prepared to indorse my statement that Mr. Gallup had a colony of bees which stored on an average 20 lbs. per day for 30 days in succession from basswood, and says that he never knew 30 good honey days in succession. It will be seen, by turning to page 160, that I did not say that Mr. Gallup had 30 good honey days in succession, but, rather, that the average yield was 20 lbs. for 30 days in succession. But I will quote Mr. Gallup's words, from page 164 of *A. B. J.* for 1872. He says: "Our first swarm came out on the 14th of May. We hived it in one of our 32-frame hives, making use of the division-board. As soon as the bees commenced building drone comb we removed the division-board and filled up with worker comb. When the basswood began to bloom we had a bursting swarm in that hive. The last of June we commenced extracting, and extracted from that hive every third day. In 30 days I obtained from the hive 50 gallons of excellent thick honey (a gallon will weigh twelve lbs.). An average of 20 lbs. per day for 30 days in succession is not bad for one swarm of bees." Mr. Gallup then goes on to tell how much he took afterward, and had left in the hive, till the total foots up to 738 lbs. surplus. Right here I wish to say, taking into consideration that this was a new swarm of the same year, and built a part of the comb used for the storing of the honey, that I consider this the largest yield of honey on record, from a single colony of bees. That 600 lbs. of this was from basswood, shows the great value of the basswood as a honey-tree, and that it was over 12 years ago that this yield was obtained, shows that we are not making such rapid strides in bee-keeping as many seem to suppose.

A WORD ABOUT THOSE WIDE FRAMES.

Brother Heddon seems to forget, on page 158, when comparing his plan of working with mine, that each of his extra colonies he puts in his field, in order to secure the honey secretion from a given area with but little manipulation, costs him at least 60 lbs. of honey each year to support. The question

which will naturally arise here, is, Which is the cheaper, a little extra manipulation, or the extra colonies and the honey they consume? Suppose that 100 colonies produce an average yield of 50 lbs. each, and by so doing secure all the nectar in a field year by year. This will give us 5000 lbs. of surplus as our share of the field, while each of the 100 colonies will use 60 lbs., or 6000 lbs. as a whole as their share, to get them through the year. Thus we fail to get one-half the honey from our field, by employing to secure what Brother Heddon calls "the greatest amount of income with the least capital and labor." On the other hand, if we employ the economy plan our English friends do, of getting the same amount of produce off one acre of land that we Americans do from three or four, we shall find our statement thus: 11,000 lbs. is the product of one field; 50 colonies are all that are needed with good manipulation to get it. Then 50 colonies must use 3000 lbs. of this as food and fuel, leaving 8000 lbs. for the manipulator. Thus it will be seen, that the manipulator gets 3000 lbs. of honey for his manipulation, and uses no more time than he would use on the 100 without manipulation, so that from the standpoint of overstocking of the Heddons, Grimms, Hetheringtons, and Oatmans, Doolittle's system of management is 3000 lbs. ahead. The same holds good, be the number kept large or small. A man can care for one-half the number of colonies on my plan as easily as he can for double the number on Mr. Heddon's plan, and this same one-half will give the manipulator as good results in dollars and cents as will the whole on H.'s plan, and save the extra honey consumed by the extra one-half of the number of bees as *clear gain* to the bee-keeper. This is not mere fancy, but facts which the success of the two plans proves.

Bro. H. says that no large honey-producer in America is working upon my plan, and says I have fallen behind the times, as if that detracted from it. I care not whether I am behind the times or ahead of them, so long as my plans give me a larger yield of honey for the colonies kept and labor performed, year after year, than do the plans of my more advanced (?) brethren.

I could quote the names of several whom I know are working similar to myself, but that would not help the plan any. I ask no one to use any of my plans unless he chooses, for the matter of being alone has little weight with me. I simply give the plans I use to accomplish given results, and all are free to use them, or let them alone, as they see fit; neither do I give them because I have a supply business back of them that needs bolstering up, for I manufacture no supplies for sale, but I give them to others as part payment of the debt I owe to those who wrote years ago, and to whose writings I owe my success in bee culture. My plans are often called expensive, and my hive and fixtures complicated; but I believe there is as little labor and cash outlay, by my plan of producing \$1000 worth of comb honey, as any plan in existence. As proof I will say, that from less than 50 colonies of bees (spring count) I have cleared over \$1000 each year for the last 10 years, on an average, as net profit. I have not hired 10 days' work in that time in the apiary, nor had I any apicultural students to do the work for me, or pay me a tuition to help swell the above income. Besides my labor with the bees, I take care of my garden, and small-fruit business; take care of a sick and helpless father, living 30 rods from me; carry

on, with the help of my wife, a subscription business, amounting to several thousand dollars each year; run my own shop and steam-engine, sawing sections, etc., for myself and neighbors; write for five different papers, and answer a host of correspondence. The old saying is, "The proof of the pudding is the eating," and so I now say, as I have said before in these columns, that all I have to recommend the plans I use is the success attained by them.

THAT PAMPHLET.

On page 165 I find these words: "Doolittle sells a little pamphlet telling how his hives are made, and used, for 10 cents, if I am correct." But, friend Root is not correct; and this notice has caused quite a boom to my already *too large* correspondence. The sale of this pamphlet is controlled by T. G. Newman, 925 West Madison street, Chicago, Ill., and the price is 5 cents, instead of 10. Will all reading this please take notice, and thus save me much correspondence?

FUMIGATING COMB HONEY WITH SULPHUR.

On page 166, I am asked if the fumigating of comb honey will make it taste of sulphur. In reply, I will say that, after a week or so has elapsed after the fumigation, I could never detect any taste of sulphur about the honey. If eaten immediately after being so treated, it might taste of the sulphur. The greatest trouble, and the one I cautioned about, was the using of so much that the combs will be given a greenish hue, which will detract much from the sale of the honey. By keeping watch of the flies that collect on the window, and letting the smoke out a moment or two after the last fly expires, the moth larva will be killed, and no harm be done to the combs.

AN ITEM IN FAVOR OF FDN. IN SECTIONS.

After repeated examinations I find that comb honey built on foundation rarely needs any fumigation. Why this is, I don't know. I only know that it is so. For the past two years I have not seen a single section so built, that showed any signs of the wax-moth larva, unless such section had once had brood in it, or contained pollen. By keeping these inferior sections (which are always less than two per cent of the crop with me) by themselves, the bulk of the crop need not be fumigated at all. At least, this is my experience for the past two years.

Borodino, N. Y., March 17. G. M. DOOLITTLE.

Friend D., I was afraid, when friend Heddon wrote as he did, that it would stir you up a little, even though you *are* pretty level generally. After reading the above, I have concluded it did not stir you up so as to do you any harm, after all, especially when you swing around on your feet as you do in your last sentence. If I remember correctly, you gave me quite a "sweetener" a few years ago, because I advised not to brimstone the honey till you detected moth worms. And now it transpires that my freedom from the moth worm was because our comb was all built on comb fdn. I confess I do not see what difference that should make, but I am quite willing to let it go without explanation, if they will keep out of our honey.—I confess I was very thoughtless in directing more correspondence to you, and I humbly beg pardon. But it does seem to me as though some sort of a little book, or "big book," would be a pretty good thing for you to have, to answer questions.—In regard to 'side storing, if I am correct quite a large number of bee-keepers are

working in that way, and I should be very glad indeed to hear from the following persons in regard to this matter: T. H. Elwood, Capt. Hetherington, W. E. Clark & Son, and Mrs. Axtell. These all use the Quinby closed-end frame, if I have made no mistake.

NAILING ONE-PIECE SECTIONS AT THE LAST CORNER, INSTEAD OF DOVE-TAILING THEM.

SOME SUGGESTIONS FROM OUR FRIEND BYRON WALKER IN REGARD TO THE MATTER.

WITH us, having a section fall to bend right is of such rare occurrence as to be hardly worth mentioning. The only reason that occurs to us as a cause of partial failure with you is, that you have to make your corner so nearly square cut, in order to avoid binding at the corners when folded; as this, of course, has a tendency to throw the section out of square—a tendency which dovetailing the ends fails to correct, according to our observation. We prefer joining the extremities with wire nails, especially where one is slightly rabbeted, so as to fit the other (as ours are at present), as we do not wish to avoid this binding at the corners, as it adds greatly to the stiffness of the section; and when properly put together (see directions for this in our circular for 1884, a copy of which we send you), they are as square as could be desired.

You have intimated that there had been some complaint about my sections, on account of their having to be nailed. The only cases that we remember of, were those of M. H. Hunt, of Bell Branch, Mich., and Mr. Gray, of Reese, Mich. The former, I believe, had never used the right size of nails to make a real success of it; yet, notwithstanding this, he, after having once tried them, repeatedly sent us large orders for sections. The latter man *tried* our section, but imagined he would have trouble, as he is getting to be quite an old man, with failing eyesight and unsteady hand. However, he told us at our convention the other day, when we met him for the first time, that he thought he would have done about as well with the nailed sections, as he had to glue yours before he could keep them in shape. We can put ours together at the rate of about 200 an hour, and never think of asking ourselves whether they are bending right or not. We think the great mistake made by those who have had trouble with nailing is, that they do not use the right size of wire nails—No. 19 wire, $\frac{3}{4}$ inch long. B. WALKER & Co.

Capao, Mich., March 10, 1884.

I know there is an advantage in having the sections nailed, friend W.; but why not have them nailed and dovetailed both? that is, why not fold them up with the dovetail, and then nail them afterward, to make them stiff and square? We have tried nailing them, but have never been able to come anywhere near 200 an hour, although we can put up 500 an hour, as we make them. I suppose with this, as with many other matters, there will be differences of opinion; and as our machinery is all rigged for making sections dovetailed, perhaps the friends who prefer them made on friend W.'s plan had better order of him. At the present demand for sections, there is not much need of any great anxiety as to who shall get the orders. As they are heavy goods to ship, we hope arrangements are being made for having them manufactured all over the land.

Heads of Grain, From Different Fields.

FRIEND KENNEDY'S ASSISTANT; WIRING FRAMES.

FRIEND ROOT:—As you do not know exactly who I am, or just where to place me, I guess I shall have to inform you. I am not a juvenile, neither am I friend Kennedy's "helpmeet." I am his oldest daughter.

Why, Mr. Root, the bees do not go on the *outside* of our section boxes. The sections are placed in the wide frames, and you know the bees can not get on the outside of them then. It is the *edges* of the sections that get soiled, and they look so much better, and are so much nicer to handle after they are cleaned off, that we think it pays to clean them. By the way, our 58 colonies of bees are all alive yet. They all had a good fly Jan. 30.

I should like to ask a question. In your directions how to put the wire in the frames, you say, "Double the wire in the middle, and commence from the bottom of the folded tin bar," etc. Now, what I want to know is, what holds the wire at the center? I should think that you mean, place it *under* the bar, if you did not say, "Spring in the bar." the last thing. If the bar is to hold the middle of the wire in place, it would have to be placed in the frame, about the first thing—before you commence putting in the wire. Besides, I should think that was a flimsy way; for if your tin bar should happen to get broken, away goes your wire. LOUISA C. KENNEDY.

Farmingdale, Ill., Feb. 6, 1884.

My friend, I was a little hasty in my directions for wiring frames, perhaps. We first wind our wire on a long strip, perhaps four feet long. Each end of the board is made sharp, like a wedge, and then covered with tin. The coil of wire is placed on a small pair of swifts, as it were, and from that wound around this board until we have quite a quantity. It is then cut at one end with a knife. This leaves it in pieces just the right length to wire the frame, each piece being doubled in the middle. The folded end is put through the hole in the center of the bottom-bar, and then a small tin tack pushed in, over which this loop slips; and then the frame is wired as per directions in the price list. As we are now selling this tinned wire in such quantities that we have to buy it by the ton every little while, it must be that bee-keepers are pretty generally using wired frames.

EXCESSIVE SWARMING, ETC.

Having been engaged, on a small scale, in bee culture, and having had some difficulty in swarming time, I have concluded to state the case to you, in order to find a remedy, should there be one, and also to inquire after the causes of such behavior on the part of my swarms. My bees did not commence to swarm until the 31st of May, and the first swarm did all right, but after that almost every swarm endeavored to run away. When I found out their little game, I began to clip the wings of the queens, and thus hindered the absconding of my swarms. But the most strange part of their behavior was the pertinacity with which they kept up their endeavors to escape. I bived two swarms on the 2d of June, and they remained in the hive apparently satisfied until

the 8th, and then when their hives were nearly filled with comb, brood, and honey, they came out and endeavored to abscond; but, as they were unable to get away, they of course came back; but one of them came out several times. When my second swarm began to come out, I was compelled to kill the unfertilized queens, and then furnish them (the swarm) with brood to raise queens, in order to save my swarms. I think that I had but two swarms during the season that did not endeavor to abscond, and some of them 3 times; had 3 swarms at one time on the wing trying to escape, with those two exceptions. Whenever I neglected to clip or kill the outgoing queen, I lost my swarms. My hives were the American, new and clean. Now, what was the cause of such abnormal behavior, and how could it be remedied? My bees did very well considering the shortness of the honey season here. I wintered 14 stands; took about 600 lbs. of honey, saved 16 swarms, and lost about 6. My stands are all living at this date, some of them somewhat light; but I have some sections partly filled with honey which I will give them as soon as the weather moderates. My hives all have chaff cushions over the frames, and so far I have not lost many bees. They are standing outdoors without any protection whatever. Which way the best, so far as honey is concerned, the 1 or 2 lb. sections?

DR. J. WESENBERG.

Moore's Vineyard, Ind., Jan. 23, 1884.

Friend B., your bees had what we call the swarming mania, and it is one of the vexed questions as to how to control it. I should divide them until they were so weak they could not swarm. But of course they could not then get a crop of honey. I do not know whether it is a mania that may get hold of any apiary, or whether it is something in the strain of bees you have. It is well known, that many queens are very much given to leading out swarms, and it usually follows that swarms inherit the same disposition. In such a case, the remedy would be to get another strain of queens. Doolittle has written on the subject, as has also friend Hasty, and a good many others of our veteran bee-keepers. I believe none of them can control this disposition when it gets well under way, or, at least, without much trouble. Hasty buries them in the ground until they get cooled off and come to their senses; but we should think that a good deal of trouble. The size of sections is a matter of opinion and locality.

ALSIKE CLOVER SEED.

The following, in regard to alsike clover seed, we clip from the *American Grocer*; and if I am correct, alsike deserves all the praise there given it. The cultivation of alsike, and the planting of basswood forests, will do more to increase the honey business than almost any thing else.

Alsike clover seed is each year becoming more in demand by the farmers of this country and Europe. Its value as a hardy variety of clover, both for hay and pasture, is being more fully established. In our issue of the 10th of May last, referring to this article, we said that after a few years' trial, alsike clover seed became very popular with the large grazers, who hid down their farms for permanent pasture. Year after year the value of this clover is becoming more generally admitted. It appears to flourish in all soils and in every climate, and at present stands high in the esteem of large and small farmers alike.

The hardy nature of the plant is proven by the fact of its thriving by transplanting, which no other

grass will do. A single plant may be divided into several parts, and each part will produce a luxuriant plant; so that farmers need not have a bare patch on their fields.

For several years past, alsike clover seed has been imported from the United Kingdom and the continent of Europe, and year after year the quantity imported increased, in proportion to the estimate put on it by our farmers; but last year and this the tide has changed its course. We are now exporting to Europe, at prices ranging from 16c. to 19c. per pound, all that farmers are willing to dispose of. Farmers will do well to note the above fact. The seed is much easier sown than red clover, and this export demand is likely to continue for many years to come.

THOMAS M'ELROY.

MAMMOTH CLOVER.

Friend Chapman, p. 97, Feb. GLEANINGS, is interested in mammoth red clover, as he says bee-keepers should be greatly interested in this, as it is an excellent crop, as it furnishes an abundance of seed as well as honey. Our crop of honey, though small, was entirely from this. A near neighbor of ours had this season over 30 acres, which yielded 7 bushels per acre. If any of the friends want some for seed, we can get it for them, and no charge will be made, only for sacks, and just what we have to pay for it, and we will make no charge for our trouble. We do this to introduce it to bee-keepers; that is, we mean in small quantities. We can get it at present for about \$7.00 per bushel. J. A. OSBUN & SON.

Spring Bluff, Wis., Feb. 5, 1884.

HONEY-DEW FROM HOUSE-PLANTS.

I have quite a large English ivy in the house, and this winter it is infested with the bark louse, called scale. I found my fern-case, which stood under the vine, covered with small spots of something sticky; and on investigating I found quite large spots of a thick sticky substance on some of the leaves. It tastes sweet on touching my tongue to it. I think it must be a species of honey-dew. Is the scale an aphid? and might not some cases of honey-dew where no aphides are discovered, be caused by the scale, which is not so easily seen?

MRS. P. P. COBB.

Middleville, Mich., Feb. 16, 1884.

MIGNONNETTE IN TEXAS, ETC.

November 23d, 1882, I bought me two colonies of Italian bees, and brought them home. I paid \$20 for them. My neighbors made fun of me; but I told them to never mind; they would be buying bees from me, and paying me \$10 per colony, and, sure enough, now I have calls for more bees than I can sell. The smoker I bought of you is the first one that has ever been in these parts; and the mignonnette that I got from you is the first that has ever been planted in this county. It grows finely. On the 25th of December I took all of my friends and went out and showed it to them, and it was as pretty a sight, I think, as I ever saw in my life. Now you just imagine it all in bloom, and the bees so thick sucking honey that you could hardly walk through it. People wouldn't believe that bees could gather honey on Christmas day.

JOHN T. LAKE.

Troy, Texas, Feb. 22, 1884.

FROM 26 TO 80, AND 2000 LBS. OF HONEY.

I set my bees out of the cellar, April 18, which was two weeks too early for this section last year; lost two in wintering, and two by spring dwindling; united one, and commenced business with 26, being in strength from light to heavy; increased to 80, and took 2000 lbs. surplus. My best swarm gave 56 lbs. in 1-lb. sections, and 109 lbs. extracted, and a large

swarm that gave 56 lbs. in sections, making 212 lbs. and a good swarm, spring count. I have Italianized 47 of them besides, by transposing larvae, as directed in A B C; 40 of them are purely mated. I increased one swarm to 10 for an experiment, and it was a success. I make all my hives, frames, and foundation, and do all my work without help; how is that for a two-year-old A B C scholar? Please tell us how far to set our bees from the road and line fences. There is some controversy here about it.

WM. H. SMITH.

Caroline Depot, N. Y., Jan. 28, 1884.

Friend S., it does not seem to me we can very well lay down any rules for the distance that bees should be from the road or line fences. If the line fence were of tight boards, and pretty high, I should think the bees might be close up, or if evergreens or thick shrubbery intervenes; also the kind of neighbors you have might make a difference. If they object to having bees near them, I think I should take them quite a way off. "If meat maketh my brother to offend," etc.

MILK AND EGGS AND HONEY.

Friend Root:—Many, very many thanks for a stopping-place to "Who Shall Keep Bees?" I thought if friend Hutchinson kept on, there would be nothing left for us farmers. He denied us the right (or, at least, the intelligence) necessary to handle foundation, wired frames, and extractors, and to raise our own honey. There was such a dark side to poultry-raising that it would not pay. I expected the next thing would be to take away our Alderney cows, deprive us of milk, eggs, and honey, and what is on the farm worth living for. My father is in his eighty-fifth year; and for more than 30 years we have kept bees, and always had some honey. For the past two years we have had a scientific bee-keeper to farm them; and although we have not as yet opened up a bank account, they have paid about as well as any other "stock" on the farm.

BELL L. DUNCAN.

Black Lick, Pa., Feb. 25, 1884.

ALSIKE CLOVER.

Some of my neighbors have started the alsike clover pretty well, and like it. Now they want to know if the seed is worth as much, or more, in common market, as our red clover, or nearly as much. Next season I will have about 23 acres within reach of my bees; and if the people can sell their seed for nearly as much as the red clover, I will have not less than 100 acres in reach of my bees in 2 years. That would be a nice thing for me.

J. C. MISHLER.

Ligonier, Noble Co., Ind., Feb. 2, 1884.

Why, friend M., I should think our price list, and what has recently been said in GLEANINGS about alsike-clover seed, ought to answer your question. The seed brings nearly twice as much as the common red clover, and the demand is always beyond the supply.

BASSWOOD SEEDLINGS.

I would like to say, through GLEANINGS, that I have no basswood-trees for sale, either "big, little, or tiny." Basswood seedlings at the Bloomington wholesale nursery are worth \$25 00 per 1000, and scarce at that price. I sold them at \$10 00 by mail.

Rantoul, Ill., Feb. 7, 1884.

H. M. MORRIS.

I presume our friends will get plenty of basswood-trees of those who advertise in our

pages, and at prices, too, less than you mention, friend M. There is a point that comes in here, however: Will basswood-trees raised in a nursery make better growth than those brought from the forest? I presume they would be stronger and thriftier, for the forest trees are so often knotty and twisted. But the question is, Which will make the better trees for timber and for honey?

THE BEST METHOD OF PRODUCING COMB HONEY.

[See page 96, Feb. 1.]

You state, "Hiving the next swarm in hive No. 1," and so on, giving the best results. Pray tell which is hive No. 1 or 2. Please make your explanation plain, and consider I am young in the business. Again, about how many colonies of bees should a person have before it would pay to buy an extractor? Again, would you recommend putting a frame of sections in the brood-chamber of a Langstroth hive? Cleveland, Ia., Feb. 23, 1884. EVAN B. MORGAN.

Friend M., hive No. 1 is the first new swarm. The idea is, that we can not put a swarm right back into the hive it came from, for they would not stay. But you can put a new swarm into a hive that had swarmed a few days before that, by giving them more room by putting on sections, etc. The advantage will be, that they will have the extra vim of a new swarm, and a great lot of brood hatching out to reinforce it right along. The only difficulty will be to keep this powerful colony from swarming again very soon.—I suppose many will think it will pay to buy an extractor as soon as they have five colonies of bees or more; and circumstances might make it profitable to buy an extractor for even one colony, if I am correct.—If you will look at our price list you will notice that we put two frames of sections in the brood-chamber of our hives when arranged for comb honey.

ASSISTING THE MISSION WORK IN INDIAN TERRITORY.

I have received a donation of 13 empty hives for missionary purposes. Bees are to follow in 3 or 4 weeks. This princely gift is from Mrs. Axtell, of Roseville, Ill. Will you please acknowledge in your journal? We are building cheap houses for churches and schools for the Indians, which are as much needed as missionaries among foreign fields.

Caddo, Ind. Ter., March 4, 1884. S. R. KEAM.

Friend Keam, we are interested in the above, because we know Mrs. Axtell, the donor, so well. Wouldn't that be a grand way to civilize and educate the Indians—teach them bee culture? It would be sufficiently outdoor work to harmonize with their natural tendencies; and who knows but that they may excel in this industry? We have made a proposition to assist friend K. in the way of supplies and implements; and if any of the rest of the friends feel like giving them a lift, I presume it will be thankfully received.

REVERSIBLE FRAMES.

While the bee-keepers are turning their attention to the reversible frame, they are running into serious trouble, unless great efforts are made right at the beginning to prevent it. Much has been said and done to get a universal frame. The writer, for one, has adopted a frame that he does not like, because it was the one nearest universal. Now, if a

thousand and one devices are brought out to make that frame reversible, and no two devices will be interchangeable—that is, to work in one hive with another—it will be like the confounding of the languages. Now I will make this suggestion at the start: That all bee-keepers be urged not to adopt any of them at present; and at the next national convention, let a committee of several of the leading bee-men be appointed to test all of the devices that may be presented, and report at the next following meeting the most practicable one, then all of us fall into line and adopt that one, if any.

A. A. FRADENBURG.

Port Washington, Ohio, March 10, 1884.

Your suggestion is a good one, friend F. No frame ought to be adopted universally that will not readily work in the hives we already have in use. Perhaps the whole matter may turn out like the half-pound sections—beginning and ending mostly with discussion.

WIRED FRAMES FOR NATURAL COMBS.

I commenced the year with 7 good colonies; increased to 18 by natural swarming, and took only 485 lbs. of comb honey. Did you ever give new swarms simply wired frames to commence with? My little brother by mistake hived a large swarm in a hive that had the frames all wired, but no fdn. in. Seeing they went right to work I let them keep them, and the result was 12 splendid wired natural combs. I shall try again this summer.

OTTO G. JOSEPHANS.

Owosso, Mich., Feb. 22, 1884.

Thank you, friend J. I believe natural combs are not always built as nicely over the wires as those were; still, it is a very valuable suggestion. I for one never want to handle any more frames of comb of any kind, without wires in to keep them from breaking down or sagging.

REMOVING WARTS FROM STOCK.

As you have been buying recipes to get something valuable for GLEANINGS, I will write one. I had a two-year-old colt with a rose-wart, or blood-wart, on the hind leg. It was two inches long, and as big as a half-dollar. It was there two years before I could get it cured. I burned it out with a hot iron, but in a short time it grew out again; then I got this recipe: Quicksilver and iodine, each 2 cz., rubbed together; then corrosive sublimate 2 oz., rubbed with the others, then mixed with 2 oz. of lard. Cut the wart off close to the leg, and apply the salve to the wart every other day until it has healed up, which will be in about two weeks. This will kill all kinds of warts on all kinds of living stock.

V. MCBRIDE.

Chardon, O., March 8, 1884.

I should think your prescription *ought* to take the warts off, friend M., and very likely it is valuable. Now, what would you think of a man who knew this, and would not tell it to a neighbor without pay? Perhaps this does not come under bee culture; but it illustrates a great truth.

BLOOD-ROOT AS A HONEY-PLANT.

Did you ever notice how bees in the early spring work on the blossoms of blood-root? Some years ago I set some plants in my dooryard under some evergreen-trees; and by keeping the weeds out, it has become a perfect bed. As long as it continues

in bloom, the bees work on it all day. As to the amount of honey they get, I am unable to say. For two or three years I have noticed that it is spreading by the seed as well as the roots, little tiny plants appearing at some distance from the place where planted; and last season I gathered some of the seed and planted it. If it germinates I shall try it again this year. It blooms early in the season, and is, as I think, a very pretty plant. D. NORTON.

Galva, Ill., Feb. 27, 1884.

A PROFITABLE SPECULATION.

Herewith find slip taken from *Cincinnati Stock Review* of March 7, 1884. I have been troubled with a sore throat lately, and could not swallow that article yet. ED. BAGGALEY.

Weston, Ohio, March 10, 1884.

AMERICAN BEES FOR FRANCE.

"Speaking of how the Americans are becoming exporters instead of importers," recently observed a New-York party, "recalls an incident in my experience. Some time ago I found a shoemaker in ill health struggling along in Boston. He knew something about bees. I had a piece of land in San Bernardino Co., California, which I offered to sell him, and gave him some help to get out there with his family. He prospered in bee culture, and when we were in California the last time, I went and saw him. We were about going to Europe then, and he asked me to take over an American queen. He was confident that the American queen-bee possessed more vigor than the Italian. I consented, and he improvised a box for it by boring in a piece of wood, put in some honey, some wax, and some of the flowers of Southern California, and gave it to me. Two months later I was repacking our trunks in Boston, when I came across my California bee. I said to Miss Morris, 'Well, I guess the queen is dead. I had forgotten all about her.' A tap on the box showed, however, that the queen was alive, and when I arrived in Paris I presented her to the American Consul, according to instruction, and he sent the bee, as desired, to the Department of Agriculture. Upon returning from Switzerland, the Consul said that he had a letter of commendation for me to bear to my California friend, from the Department of Agriculture. The American's claim proved true. It was satisfactorily demonstrated to the Department, that while the Italian queens produced but 40 per cent of working bees, the American queens produced 64 per cent. My California man is sending all the bees he can spare to France now, in little packages by mail that cost him 2 cts. to post, and is getting \$6.00 apiece for every one of them."

Friend B., it occurs to me my throat is sore too, since reading the slip you send.

SEPARATORS ARE ECONOMICAL.

There is one point I want to mention in regard to using separators. Last spring we bought 12 lbs. of fdn. for sections at one time; at another time we got 10 or 12 lbs., only a part of which we used. I think I would be safe in saying we used 15 lbs., which, at 60c per lb., would cost \$9.00. Had we used starters full size, it would have cost us three times as much, or \$27.00 for fdn.; hence we saved \$18.00 in cost of fdn. All the separators we have cost us less than \$14.00, leaving a net profit of \$4.00 the first year, \$18.00 for the second, and \$184.00 for eleven years, and all combs straight.

WHO MAY KEEP BEES?

He who has lived half of his threescore and ten years, and made a success of all his undertakings can safely undertake to keep bees for profit; but he who drags along just a little behind his neighbors in nearly every thing must expect failure, if he undertakes the care of bees. A friend asked me what was the most important to succeed in bee culture. I answered, "Eternal vigilance." Perhaps that was putting it a little strong. Among those near here who kept bees for from 3 to 6 years, one has none, one has one colony, 3 have some bees, but have made no clear money. There are many starting in who succeed to some extent in raising honey, to whom selling it is a "bug-bear." Ten cents will buy their comb honey when it is worth 16 cents on the market, whereas; while the bee-keeper who has worked hard and conscientiously for the trade steps out of the home trade until they have sold all theirs, and

the grocer orders his at 16 cents. I would suggest, that each bee-keeper ship an occasional case or two of honey to the nearest city market, and let the net price obtained guide him in the price he asks in the home market.

ARE BEE-STINGS DELETERIOUS?

We want more light on the effect of bee stings, or poison, on the human system. Does it not cost lame elbows, partial paralysis of the arms and shoulders?

MOTHS.

The moths seem to bother, some of the friends. Our experience is, if all colonies are kept strong, and all waste comb put in a tight box, every thing kept neat and clean, moths will do no harm. We put our honey in a tight cupboard, and in shipping-cases, and have no trouble. J. SYKES WILSON.

Penrose, Ill., March 4, 1884.

Friend W., if you will excuse me, I am afraid your reasoning is a little faulty. If you used large-sized sheets of fdn. in the sections simply to get the combs straight, your reasoning would be all right; for separators are used for getting straight combs, and nothing else. But if the bees fill the sections with honey in much less time from having fdn. than they would if they had to manufacture the wax and build all the comb, this puts a different phase on the matter. If I am correct, the fact that full sheets of fdn. give straight combs without separators, was only one of the reasons for using fdn., and a minor reason at that. — I do not think that lame elbows, arms, and shoulders, are often caused by bee-stings, if ever. Mr. Langstroth got an idea at one time that is to the post, of the bee-stings was injurious to him; but he has written me since, saying he thought it was a mistaken idea that he had got. If you will make a little inquiry, you will find there are by far more people suffering from a sort of partial paralysis, who have never been near bees, than there are among bee-keepers.—I agree with you in regard to moths.

BEE-KEEPERS' TELEPHONES.

The telephone I got of you in the fall works nicely, when we can keep it together. I have the posts 100 yards apart. When we get a heavy wind it breaks; also when we stretch it a little too tight for 450 yards. I have a neighbor who has iron wire, two sizes heavier than broom wire; it reaches $\frac{1}{4}$ mile, and works well. Some say it rusts. He has had it up two years, and it is now apparently as good as ever.

Millersburg, O.; March 10, 1884.

C. F. UHL.

I believe the annealed brass wire we furnish has generally been considered more sensitive, friend U., although iron wire will answer. As it has to be out in the weather, it should be coated or galvanized, or it soon rusts. The shellac-coated steel wire which we advertise on the 10-cent counter might do very well. The greatest objection I have heard to it is, that it is too stiff to be drawn up tight enough. Perhaps others can tell us in regard to this matter. The manufacturers of the Bliss telephones which we sell, seem to think the composition wire put up with the instruments is the best; and as we generally sell them to tell when the bees are swarming, this light wire would probably be more sensitive to the bumps they give it.

Reports Encouraging.

SOME ENCOURAGING WORDS FROM FRIEND MARVIN.

IT has been the best year for selling honey, since I have been in the city. This is the first year of clearing out the entire stock in 7 years that I have been over-stocked; one of the seasons, an entire failure, the only one in thirty-three years. I can sell 20 to 30 bbls. of extracted and 3 to 6 tons of comb honey more readily than I did at the commencement with 300 to 600 lbs.

J. M. MARVIN.

St. Charles, Ill., March 3, 1884.

FROM 4 TO 18, AND 400 LBS. OF HONEY.

In the spring of 1883 I started with 4 colonies — one queenless, and increased to 18, mostly by artificial swarming. I got 400 lbs. comb honey — no big money, but still I am not willing to be classed with the "Blasted Hopes" party.

P. C. VANDOREN.

Curran, Ill., Feb. 21, 1884.

HONEY REPORT, 1883.

Commenced last spring with 48 swarms; went into winter quarters with 88; worked for comb honey; got 4000 lbs.; sold from 12 to 15c per pound; very poor season for honey, after white clover got through blooming.

S. PARDEE.

Volga, Iowa, Jan. 14, 1884.

\$140 FROM 9 SWARMS, AND 5 SWARMS INCREASE.

With your permission I will tell you what I have sold from 9 swarms of bees, spring count, for 1883. Sold \$95 worth of bees, and \$45 worth of honey, and I have 14 good swarms now. This I claim to be clear gain for me, as I can not work. The five swarms will pay for the hives, so you see I make more money from nine swarms of bees than any man makes from 9 of the best cows, taking out the expense of the cows. I have not said any thing about the honey we have used at home.

Sherburne, N. Y., Feb. 8, '84. A. W. DENISON.

MAKING A SUCCESSFUL START WITH 50 COLONIES.

I began bee-keeping last spring; procured fifty colonies, partly in boxes and old gums; procured two months' practical help of one person. I took 5100 lbs. extracted honey; no comb; increased to 110 colonies; have all in good hives, and have all but 10 swarms in cellar, well ventilated. So far all seem to be doing well.

W. H. MINNICK.

Oskaloosa, Iowa, Jan. 31, 1884.

Friend M., you are almost the only man I ever heard of who commenced with so large a number, and succeeded. But I presume the whole secret of it was, that you hired a practical man to work with you, and show you how. There is a pretty good moral right here.

FROM 13 TO 38, AND ABOUT HALF A TON OF HONEY.

For the past few years I have been experimenting with bees under the new mode of culture, and have found that bee-keeping is a paying business, if we have plenty of knowledge of the little creatures. All the knowledge I have has been gained from the A B C and actual experience. This last year was my first experience in extracting. From 13 colonies I extracted between 500 and 600 lbs. I also raised, from the same colonies, between 400 and 500 lbs. nice section honey. I put up for winter, 38 strong colonies. How is that for an A B C scholar? I have

never used double-story hives, because my knowledge and finances were limited. I extracted from the body below, I knew it was not the right way, but they were all strong, and I took only a little from each hive. I live in a good locality, if I am a judge. I am surrounded by timber on all sides, consisting of nearly all kinds, including plenty of basswood and willow. Of the amount of honey I raised, I had some over 200 lbs. of basswood. I intend, another season, to run principally to extracting. I keep Italians and hybrids.

R. H. LAWRENCE.

Clarendon, Mich., Feb. 14, 1884.

FROM 8 TO 15, AND \$55 00 WORTH OF HONEY.

I will give my report for 1883. The season was not very good here, being cold and wet much of the time. Most of the bee-keepers got no surplus at all. I had 8 swarms, spring count; increased to 15, and one went to the woods; sold about \$55 00 worth of honey, getting 20 cts. for comb and 15 for extracted. My first new swarm gave me 68 lbs. comb honey; 2d swarm, from same hive, gave 25 lbs. My weakest swarm in spring gave 90 lbs. of extracted. One swarm, with as good treatment as the best, gave none. I began keeping bees in 1879, and have never lost one in winter.

GEO. P. HOWARD.

Marion, N. Y., Feb. 11, 1884.

44 LBS. OF HONEY FROM A SINGLE COLONY, IN A SINGLE DAY.

My little boy, Bennie, 9 years old, who died on the 4th of this month, and myself, had quite a prosperous year with our bees. Started with 15 colonies; increased to 38; got 3000 lbs. of surplus honey—1000 lbs. of comb, in section boxes, and 2000 lbs. of extracted — an average of about 200 lbs. to the colony, all white-clover honey, and nearly all the surplus honey was made by the new swarms. One colony of Italians made, or, rather, filled, 260 1-lb. section boxes, and had abundant stores for the winter. The same colony gathered 44 lbs. of honey in one day, when put on empty combs, as Brother Hall, who was to see you last fall, can testify. That amount includes what they took with them when they swarmed, and many others did nearly as well. We had no honey but white-clover; saved plenty for the family and bees; sold the rest—comb, 20 cts; extracted, 15. When I left home, Nov. 1, many of my chaff hives were crammed full from bottom to top, 24 frames. I worked, watched, and waited three years for a big flow of honey, and was at last paid for all my trouble and expense, with good interest, and an abundance of good feelings. Bees have gathered honey and pollen every day this winter here, with the exception of about seven, and will be ready to swarm about the last of this month, or as soon as the orange blooms. The honey is not so good here as the white-clover honey of the North.

J. F. MILLER.

Orlando, Orange Co., Fla., Feb. 7, 1884.

Friend M., we do not doubt your word in the least; but I can not help wondering if you have not made some mistake somewhere. You allude to the honey they took with them when they swarmed. Will you please give us the full particulars, and tell us how you weighed the colony, and how weighing the honey was done? If I am correct, this is ahead of any thing on record; yet I suppose it is possible, with an extremely powerful colony and a great flow of honey. May God help you in your affliction for the loss of your little Bennie.

Notes and Queries.

REMOVING BEES TO BASSWOOD FORESTS; THE PROJECT LIKELY TO BEAR FRUIT.

AS queries keep coming in regarding the basswood locality I spoke of, will you please say that friends Flanagan & Illinski expect to move 100 or 200 colonies direct from New Orleans, and occupy the field the coming season? And won't it be better to wait and see the result before more coming? I feel much interested in the enterprise, and wish them abundant success.

Fremont, Mich., Feb. 16, 1884. GEO. E. HILTON.

HONEY FROM HEART'S-EASE, NOT CANDYING.

You ask if any one has any honey from heart's-ease, that doesn't candy. I have some that was made last season that has never candied, and I don't think it will. It is very stiff and thick. Bees are all alive, and in good condition to date.

J. W. DUCK.
Lindcn, Iowa, Feb. 11, 1884.

SAD NEWS FROM FATHER LANGSTROTH.

I write at the request of my father, to let you know of the return of his old malady. He is at present more affected by it than for some time past, and utterly unable to attend to any correspondence.

Oxford, O., Feb. 6, 1884. A. L. CORVAN.

[The above should have appeared some time ago, but it was overlooked. When I talked with friend L. in Toronto, he seemed hopeful that he would escape a return of his old malady.]

ANOTHER STRAW IN FAVOR OF ABUNDANT VENTILATION.

A neighbor captured and hived a wild swarm of black bees, Aug. 19; hived them in a half salt-barrel; set them up one foot high, with a crack in bottom-board; fall rains loosened a quarter of the combs; partially sheltered from winds; no other protection. Feb. 21 he found about a pint of dead bees. Mine brought out about the same quantity from chaff hives in two warm days.

W. YOUNG.
Palmyra, Neb., Feb., 1884.

OLD COMBS NOT NECESSARILY A DISADVANTAGE.

G. H. Kaufhold, a resident of Winfield township, Butler Co., Pa., is the owner of a colony of bees in a box hive that have lived in it 49 years; no old combs have been cut out of it in those years; has stood the storms of all those winters, without any protection; they are black bees, and are not gray-headed either. Does this not speak in favor of a hardy strain of bees? If any other bee-keeper knows of any older colony, I should like to hear from him.

JOHN A. PUGH.
Hannahstown, Pa., Feb. 14, 1884.

THROWING HOT WAX INTO VERY COLD WATER; A CAUTION.

I have had a curious experience with beeswax. I had a lot of comb; reduced it to wax; skimmed it off, and threw it into cold water. It combined mechanically with the water, and that so completely that it looked much like good wax. I tried to get it clear of water by keeping it melted on water, but no go; then I put it into a shallow boiler and boiled the water out, and it took a heat that rose gradually to 350° before it expelled all the water. Result, dark hard wax.

H. SMITH.
New Hamburg, Ont., Can., Feb. 22, 1884.

CONVENTION NOTICES.

The Western Michigan bee-keepers will hold their spring meeting at Berlin, Mich., April 21, 1884.
F. S. COVEY, Secretary.

The State Central Bee-keepers' Association will meet at the court-house in Waco, Texas, April 12, at 2 o'clock P. M. JUDGE E. P. MASSEY, Pres.
J. W. GUYTON, Secretary.

The Northern Ohio Bee-keepers' Association will hold its annual meeting in the city Council Chamber, at Norwalk, O., April 24, 1884, commencing at 10 o'clock A. M. A full attendance is requested.
S. F. NEWMAN, Sec.

The bee-keepers of Tascara was county, Ohio, will meet in the town hall at Port Washington, Ohio, on Thursday, May 15, 1884, to organize a bee-keepers' association. All are earnestly invited to attend who will.
A. A. FRADENBERG.

CIRCULARS RECEIVED.

W. J. Endly & Co., Edgerton, Kan., send out a postal price list of queens, etc.

D. A. Pike, Smithsburg, Md., sends us a 4-page list of Albino and Italian queens.

Derr & Kreider, Sterling, Ill., issue a 4-page list of hives, sections, etc.

G. K. Hubbard, La Grange, Ind., is out with his spring circular of the "Hubbard hive."

W. W. Bliss sends us a 4-page list of fm., bees, etc. It is printed with a chirograph. Duarte, Cal.

Dr. A. P. Coulter, Marietta, Ill., sends us a 4-page list of Italian bees, etc.

C. C. Vaughn, Columbia, Tenn., sends out an 8-page circular, queens and bees only.

Reynolds' Bros., Williamsburg, Ind., send out a 10-page circular of supplies in general.

W. J. Ellison, Stateburg, Sumter Co., S. C., sends us a one-page circular of bees and queens.

From Nims & Voorhees, Burlington, Wis., we have received a 4-page list of section cases, crates, etc.

J. H. Woodworth & Co., West Williamsfield, Ohio, send us a very pretty 4-page list of bee-keepers' supplies.

Grainger & Duke, Toronto, Can., send out a 4-page circular of simplified hives and apparatuses generally.

James O. Facey, New Waterloo, Ontario, sends us a 4-page circular in regard to bees and queens, hammers, and wire nails.

Thomas B. Blow, Welwyn, Herts, England, sends us a 48-page catalogue, profusely illustrated with cuts of honey implements and devices; containing, also, quite a pretty view of his apiary, with a picture of his hive factory on the back cover. The catalogue is quite instructive, even if one should not care to send him an order.

D. Kaufman, Needy, Clackamas Co., Oregon, sends us a 2-page price list. Queens and bees are the particular things advertised. We are glad to see supply dealers start up in Oregon, for it gives me pain every time somebody sends us an order for queens and bees to be shipped this great distance.

Friend K.'s prices on bees and queens are the same as our own.

Second-Hand Foundation Mills!

The three following mills we have taken in the way of trade. Although they will do just as good work as new ones, they are old-fashioned in style, so we offer them at a low price. They have all been worked over, so as to make the new style of cell.

One with 5½-inch rolls, cost new \$15.00; present price, \$7.50.

One Washburn mill, 9 inch, nearly as good as new, offered for \$15.00.

One Olm mill, 10½-inch rolls, made about a year ago, also for \$15.00.

Besides the above, we have a \$60.00 nickel Dunham mill, made expressly for us, which we offer at \$25.00. The mill has been used but little. The three mills first mentioned are in our possession, ready for shipment. The last one is with Charles Dadant, Hamilton, Ill.

A. I. ROOT, Medina, Ohio.

UNPARALLELED OFFER.—Warranted Italian queens only \$1.00. Address S. F. REED, North Dorchester, N. H. 7-13d.

We are rejoicing in 6292 names to-day, March 27, and our bees are all in tiptop order too.

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE
OF READING MATTER.

MEDINA, APR. 1, 1884.

Set a watch, O Lord, before my mouth; keep the door of my lips.—PSALM 141: 3.

ALSIKE-CLOVER SEED DOWN TO OLD PRICES AGAIN.

We have just received 30 bushels of the nicest alsike-clover seed that we ever had for sale, which we can ship by first train at \$10 per bushel; \$5.25 per half-bushel; \$2.75 per peck, or 20 cents per pound. By mail, 18 cents extra for bag and postage.

BLASTED HOPES.

PLEASE send in your reports of failures, friends, and we will keep the above department going; but don't send in essays about bee culture being a failure. In fact, I do not believe we want *essays* on any subject just now. Give us facts from experience, both good and bad.

PEA VINE, OR MAMMOTH RED CLOVER.

SO many questions have been asked in regard to pea-vine clover, we have decided to send a small package free to any who may care to see the seed, and test a few plants. Just tell us on a postal you would like some, and we will mail a few seeds, with directions for cultivation.

PATENTS AND BLACKMAILING.

JUST now we hear of a little broeze about somebody who has patented the idea of setting the sections directly on the brood-frames. (Our friend Langstroth patented the idea of a bee space between the brood-frames and the honey-boxes, as you may remember.) This is even worse than Mitchell and the other man, who had a patent on having hives two stories high, or one hive on top of the other.

FOUL BROOD; AND DOES IT EVER GENERATE SPONTANEOUSLY?

IN answer to several inquiries, I do not believe it possible that foul brood was ever originated because healthy brood died from being chilled, or from any other such cause. Corn never grows where none has ever been planted; neither does any other plant grow without seed, and foul brood is, if I am correct, a plant, or, what amounts to the same thing, a fungoid growth.

AN ITEM ON THE SPRING-DWINDLING MALADY.

NEIGHBOR H. has wintered his River apiary almost without loss, and the bees, like our own, are bright, clean, and entirely free from any trace of the bee disease. His home apiary, however, not over two miles from our own, has dysentery and dwindling badly. No feeding was done at any of these three apiaries—all had natural stores. What should make the difference?

OUR OWN APIARY.

WE have 150 colonies of bees, all in nice trim. Only one has been lost up to date; 30 of the 150 contain imported queens; 30 more, select tested queens, and the remaining 90, tested queens; therefore we have

no blacks nor hybrids, and probably shall not have any black queens for sale during the season; but we may have a few hybrids as soon as we get to selling untested queens. Those who have blacks and hybrids to dispose of can advertise them free in the proper department.

I AM happy to say, that beeswax seems to be at a standstill, and bids fair to remain about where it is until about the end of the season. If it will do this, we shall probably have a pretty big drop about the time the demand begins to decline. Perhaps one reason why prices have not run up, is because so many are using foundation-mills of their own, thus preventing, partially, the chance of speculating and making "corners" in wax.

NEW INVENTIONS IN BEE CULTURE.

DO not go to the expense of sending us models by express, friends, till you have first written in regard to your inventions. The greater part of them that are sent in are simply old ideas that have been advanced and discarded. Write first, telling me about it, then I can tell you whether it will be well to keep working at it, or to send a model; and by all means, read over the back numbers of the journals, to see what has been done, or, at least, consult the indexes; and, as a matter of course, refer to the modern bee-books now before the people, and keep posted as to what has been already done.

DRONE-TRAPS.

WHILE describing friend Alley's trap in our issue of March 1, p. 150, it seemed to me as though the idea was not quite new, and I am now reminded that the essential features were described on page 467, of our Sept. No. for 1882; in fact, friend J. D. Black, Brandon, Ia., sent me a model of it, which I have now in my possession. We presume friend Alley did not get his idea from that editorial; but as he has had GLEANINGS right along, it seems to me a little strange he should claim it as his invention. I can give a drawing and explanation of the original trap sent us by friend B., if it is thought necessary.

WE have received from Rev. T. F. Bracken, New Florence, Pa., one of the brightest little pamphlets that have fallen to our lot to see in many a day. It is entitled, "A Dose of Truth, in Three Parts." The three parts of those doses are as follows: "The use of tobacco by the clergy; its sale by church-members; means and motives to reform." The price of the book is 25 cts., and it is hard to find more wisdom embodied in one little book. Especially am I pleased with its Scriptural texts in regard to tobacco. If any one thinks the Bible does not cover the ground, let him read the first few pages. May God's blessing be with friend B. in the stand he has taken; and may it lead the clergy to realize what they are doing when they persist in the use of tobacco!

THE proper clerk reports that he has three boxes of beeswax on hand, no name, date, nor any thing to tell whom they came from, or where. There are also half a dozen letters, perhaps, saying they have sent us beeswax, but don't tell how much, or give us any clew to the boxes. In our advertisement for wax on the cover of GLEANINGS, we give a constant caution, and request you to put your name on the box, and say how much you send. One of the little gummed labels I have said so much about, telling where you live and what your name is, pasted on the box, either inside or out, would fix it all pleas-

ant. I know you say you are willing to trust me to do the right thing; but, friends, I do not want to be trusted. Put your name on your box of wax, then write a card telling just how many pounds you send, and how you sent it.

BYRON WALKER'S IMPROVEMENT IN ONE-PIECE SECTIONS.

ABOUT a year ago, friend Walker told us in an article about his plan of making the Gray section so it would fold in the right place itself. We neglected to say that we have used the plan ever since, and our machines have all been sent out with the saws sharpened in such a way as to cut the proper side of the groove a little deeper. I believe the plan is now in use by nearly all manufacturers of one-piece sections. Whether they struck upon the idea themselves, or whether the hint in GLEANINGS was what started them that way, is more than I can say. In any case, the thanks of the bee-keepers in general are due friend W. for his timely suggestions. It is true, that when the sections are folded up they are inclined to be a little more out of square; but when they are put up in their respective wide frames or cases, they are held true, and readily sit of their own accord after they have been a little time in that position, or become filled with honey.

SELLING RECIPES.

AN objection has been raised to my remarks last month, on the ground that lawyers and architects and others frequently charge five, ten, and even one hundred dollars, for the contents of a single sheet of paper. It seems to me it should be generally understood that I was not speaking of work prepared for a single individual, but rather of something needed by so large a class of individuals that a printing-press would be required to strike off the copies. After the matter and drawings are prepared for the press, the expense of 1000 or 10,000 is but a small matter; and if 1000 or 10,000 people would be benefited by it, to act in accordance with the spirit of the present age the price should not be \$1 00, nor even 25 cents, for that matter, for the contents of a single sheet of paper. This is my opinion in the matter, and I do not mean to let any thing go into GLEANINGS that would encourage or foster, directly or indirectly, the plan of selling secrets, to which I have alluded. Another thing: Such a course would involve a promise "not to tell;" and when I know any thing that is valuable, I shall always tell it. If I had a neighbor who knew something that would save me great pains and labor, in a few words, and wouldn't tell it, I should feel he was not very neighborly. Of course, I do not want anybody to break promises that have been made; but I would avoid making promises in such a matter.

LONG LETTERS.

UNTIL within the past few months I have been in the habit of reading every letter addressed to me. I am sorry to say, dear friends, I can do it no longer. In my new desk is a large apartment, labeled "Letters not Read." They have been waiting months until I could get time to consider them more fully. I think it no more than fair to tell you that I shall probably never get to them. More letters are going in there daily. I glance over them as they come out of the mail, to ascertain, as well as I can, whether they contain any thing of sufficient importance to be read carefully. If there is important matter for print, they are laid aside as matter for

GLEANINGS; but this department is also so full that it can never be used. Business letters I look through briefly, much the same way, and then give them to the proper clerks to read carefully. You may ask why I do not have somebody else read carefully these unread letters. It would require a very expensive hand; and, worst of all, I do not know of anybody in the world who could read them and give such answers to them as I should like to have given. The moral that stands before us, friends, is, to be brief. Where there is so much to be done, we shall have to get over wasting words on unimportant subjects. A large part of these unread letters are from beginners in bee culture, asking my opinion of the new hive they have just got up. Many of the letters are from those who never read the A B C book, and very likely never read a bee-journal of any kind. Long pages are devoted to describing things already known, and oftentimes fully described in our books and journals. Another thing: Many times where something is wanted, a page or more is occupied with a sort of preface. Go right into the matter at once, friends, and tell me as briefly as you can what it is you wish, and I will try to give you a prompt answer. I feel sad to write this; but the duties I owe you all, I think, demand it.

ORDERING THINGS DIFFERENT.

I KNOW this is a world of many men and many minds; and I know, too, that if people did not have different tastes and wants, we should not only lack variety, but we should lack progress. Still, where one wishes to economize time and money, much might often be saved by endeavoring to use regular goods in the regular channels of trade. I was reminded of this by an order from a friend who wanted a couple of our tents for setting over bee-hives, all but the sticks. I told him they would be 25 cents less, sent thus. Now, we make these tents but once each year. The materials are brought together, and one has it his business to do the whole. Had I only thought of it, our cheapest way would have been to have sent our friend two regular tents, telling him to get out the sticks, and throw them away. But we attempted to pack all the different parts, except the sticks. After trying three or four times, getting clerks out of temper, as well as our customer, we came pretty near giving up that there was nobody in our establishment who could tell how or who could himself put up a bee-hive tent all but the sticks. First, the cloth only was sent; then our friend complained that he did not have the cords. The cords were measured off, sent by mail; then he did not have the rings nor the bolts nor the washers nor the screws. A great many times some friend has wanted a certain part of our 50-cent smoker, not advertised in the list. Had he ordered a whole one, we should have had nothing to do but to write his name on one from the great heap already piled up beside the mailing clerk; but to get the part wanted, a clerk must go to the smoker room, and thence perhaps to the tin-shop, thence to the machine-shop, stopping workmen, calling in others to help decipher just what was wanted, and even after all this trouble and hindrance, sending the wrong thing, perhaps, and then getting a long letter about it for me to read and answer. If you ask for something advertised in our price list, it ought to go promptly, like clock-work. But something a little out of the beaten track or channel results as I have told you above.

HOLY-LAND, CYPRIAN, AND ALBINO Queens & Bees.

We have a strain of Syrian bees that are very light, prolific, great honey-gatherers, and as gentle as the average Italians. The different breeds raised in separate apiaries. Tested queens now ready; untested queens by the first of May. Price, one-fourth more than Root sells Italians. Italian queens, and bees by the pound, same price as Root's. Send for circular.

O. A. HOAG,
7fd**b**. West Union, Cass Co., Mo.

Gray Bees for Sale!

Having received many inquiries the past season in reference to my gray bees, to you and others who wish to purchase, I will say that I will spare a few colonies, to be shipped in April and May, 1884, at \$10 per colony, in good hives, straight worker combs, and lots of bees. After years of experience, this race of bees has proved to be the most profitable to me. Those who suffer much from being stung would find these bees very mild. I use no protection when handling them. All questions promptly answered, and the best of references given as to responsibility. Address
D. F. LASHIELD,
7d. Hooper, Broome Co., N. Y.
This notice will not appear again.

BASSWOOD - TREES.

If ordered at once, sprouts, per hundred, \$1.00; two to four feet, per hundred, \$3.00; four to six feet, per hundred, \$5.00. Six to ten feet, 10 cents each.

NUCLEUS COLONY with Italian queen after June 1st for only \$3.00. Samples of business cards, 2c. **J. L. HYDE,** Pomfret Landing, Conn. 12½td.

BEE-KEEPERS, LOOK AT THIS!

Just what you want to make bee-keeping a pleasure as well as a profit, is the Acme Honey Case, or Crute. The principle of this case can be easily applied to any movable-comb hive, so as to give free access to lower wide frames or surplus brood-frames, without removing case or top boxes. After two years' trial, I can say that, for convenience for comb and extracted honey, it is without a rival. Circulars free. For full particulars, address

THOMAS GORSUCH,
7d. Gorsuch, Huntington Co., Pa.

I WANT TO SELL!

Being unable to keep my apiary in the city for want of room, I offer the same for sale cheap. It consists of about 60 colonies of Italian bees. Hives are mostly one-story chaff, with top story for surplus. Langstroth frame, 17 $\frac{1}{2}$ x 9 $\frac{1}{4}$. All combs built on heavy foundation. 200 surplus brood combs, etc. 7d.

JAMES URE, East Saginaw, Mich.

WAX

Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards selling "Bees and Queens for Sale," same price.

CITY MARKETS.

NEW YORK.—Since February we have had a good demand for honey, both comb and extracted. At present our market is entirely bare of one-pound sections, but is still well stocked with two-pound sections. We are well satisfied with the quantity of honey we disposed of, also with the prices obtained for same. We expect to have a fair demand until about June. Not likely that our market will be sold out when the season closes and several lots will probably be carried over. We quote comb honey: Fancy white, 2-lb. sections, 15@16c; good white, 2-lb. sections, 14@15c; fair white, 13@14c. There has been no extracted buckwheat in our market for some time. Extracted clover and basswood in good demand, and sells readily from 8 to 9c in barrels or kegs.

Beeswax.—Market has been dull for the past three weeks. No supply, and no demand. We quote choice yellow Southern, 36@37c. Good Western, 34@35c. THURBER, WHYLAND & Co.,
April 11, 1884. Reade and Hudson Sts., N. Y.

KANSAS CITY.—Honey.—Demand for comb honey good, with lower prices—15@16c for choice 1 and 2 lb. sections. Dark and broken, or irregular comb, slow at 10 to 12½c. The liberal receipts of comb honey from New York State have cast much Western honey in the shade, and our Western producers will have to look to their future. There have been thousands of pounds of Eastern honey marketed here this season, and almost every comb has been perfect in every respect. It is hard to sell the unsightly stuff that I am receiving daily from other sources, by the side of this handsome honey from the East. Extracted in fair demand, 8@9c, according to quality and color. JEROME TWICHELLE,
Apr. 11, 1884. Honey Depot, 514 Walnut St., K. C.

ST. LOUIS.—Honey.—Our market continues very dull for honey. Occasional sale, in barrel, 6@7c. Retail in small cans, 9@10c. Comb honey a light retail demand, 14 to 16c in good order and good color. White clover, 18 to 20c. Any cases having broken combs, 10c.

Beeswax.—Not much arriving. Quote yellow at 36c. W. T. ANDERSON & Co.,
April 12, 1884. 104 N. Third St., St. Louis, Mo.

CLEVELAND.—Honey.—There is no change in honey market. Best 1-lb. white continue to move off most readily at 14c, the 2-lbs. move more slowly at 16@17, and second quality is not in demand. Extracted, 10 sale. **Beeswax** wanted at 35c, but no supply.

A. C. KENDEL,
Apr. 9, 1884. 115 Ontario St., Cleveland, O.

CHICAGO.—Honey.—Honey is sold in a small way nowadays, package at a time. Prices are easy: 10@16c is the range on comb honey. Extracted is not meeting with any demand; have never known the demand to be sought; 7@8c is the range. **Beeswax** scarce at 30@37c. R. A. BURNETT,
Apr. 10, 1884. 161 South Water St., Chicago, Ill.

BOSTON.—Honey.—Please quote our market as follows: 1-lb. comb, 19@30c; 2 lbs., 15@17c. Extracted, 8@10c. Dual sale. BLAKE & RIPLEY,
Apr. 10, 1884. 57 Chatham St., Boston, Mass.

DETROIT.—The honey market is very dull, good honey going slowly at 14@15c.

Beeswax.—Hardly enough to be quoted, st about 35c. A. B. WEEP,
April 12, 1884. Detroit, Mich.

NOTES FROM THE BRIGHT-BAND APIARY.

FRIENDS:—The last time I appeared under the above head was more than a year ago, at which time, as some will remember, I laid much stress upon the superiority of my queens. Well, now for the result: Quite a number of queens were sold, and the next season (which was last summer) still a greater number were sold; in fact, I had orders for more than I could raise; consequently I have removed from my old place (Greenville, Tenn.), to this place, that I might raise earlier queens, and have facilities for raising a greater number of queens. I can now command 500 colonies in the queen business, if necessary. My intention is to produce queens not excelled by any. Price, untested, but laying, in April, \$1.40 each; in May, \$1.25 each; 90 cents each the rest of the summer. Tested queens, in May, \$2.00; the rest of summer, \$1.75. The above are from imported Italian queens; queens bred from Kingsley's improved bees, same price. Kingsley's improved bee is simply a cross between the Cyprian, Italian, and Holy-Land bees; and in reality they are ahead of any race, both for color and honey-gathering propensities. Sample live workers sent for 3c to pay postage.

All orders promptly attended to; safe arrival guaranteed; full directions sent with each queen.

GOOD QUEENS.

FRIEND C. C. MILLER TELLS US HOW HE WORKS TO GET THEM.

I COULD well afford to buy queens at \$3.00, perhaps \$5.00 each, to requeen each one of my colonies annually, if thereby each one could be made to yield as well as the best; therefore it pays to take much pains in rearing queens; and heretofore I have not hesitated to break up my strongest colonies for that purpose, making it more expensive than to buy them; but I thought I might get better queens. As I never raise queens, except for my own use, and as I do not care to requeen old colonies, or start new ones till the swarming season arrives, I have now adopted a plan by which I think the best queens can be raised, yet without interfering with the storing labors of any colony, unless it be the one which supplies the eggs for queen-rearing; and even that, by taking pains enough, might be kept steadily at work on the harvest. For the sake of convenience, however, my best queen is kept in a colony which is kept rather weak, having only about four brood-frames. The hive is placed on top of some other hive, of course above the supers; and when it gets too strong it is moved to a new location on the top of another hive. Its flying force will then join the colony over which it had been placed; but enough bees will be left, and of the best kind, to keep the queen laying, with no thought of swarming. Eggs for queen-rearing may be taken from any part of the brood combs where they may be found. But I find it more convenient to prepare a special place for them, especially as I can then tell

the date when the eggs were laid. To this end I save up some sections which have been filled, or partly filled, and then emptied again, preferring those that are of about the right depth for brood-comb. The comb of one of these is carefully cut out of the section frame—mine are pound sections; if larger, I think I should use only part—then I take from the hive with the best queen one of the center frames, and cut a piece of comb out of the center of it, where the queen is most likely to lay, of just such size that the piece of section comb will fit snugly into the hole that is left. It will need no other fastening than simply crowding in. Returning the frame to the hive, I make a note in my record-book, of the date. Next day I look to see if eggs are in it. If not, I am pretty sure to find them a day or two later, and I keep track of the date on which the first eggs are laid. Usually I cut out this piece of section comb containing eggs, in about three days from the time the eggs are laid, and use it for queen-rearing, replacing it with a fresh piece, thus continuing until I want to raise no more queens. The same thing may be done with another frame, or two pieces of section comb may be used at the same time on each of the two center frames. This furnishes us eggs for queen-rearing. Now for the place to put them.

If the reader will recall or refer to the plan I gave last number, page 231, for the treatment of colonies that have swarmed, he will see that in one to five days after the issuing of a swarm, there is left on the old stand a hive with no queen and no unsealed brood, and only two or three brood-combs. I know of no better place to raise queen-cells, as we have a

strong colony, just in the humor to raise them. Here, then, at the time of putting up the queen on top, we put our eggs in one of the frames below. I like Alley's plan of cutting up the comb with eggs into strips, and with a match killing the egg or larva in each alternate cell, only I use the match *before* cutting into strips, leaving every *third* cell in the row untouched. Suppose I had given the empty comb to my best queen June 1, and find no eggs on the 2d, but find some on the 3d. These *may* have been laid on the 2d, after I had looked, and I work on that basis. On the 5th, therefore, I give them to the queenless colony already mentioned, marking on the frames containing them, 17th, this being the date on which the first queen *may* hatch out, for I have found that queen-cells may hatch out in fifteen days from the laying of the egg, if in a very strong colony at the swarming season. Of course, my record-book and memorandum of work to be done keep me posted as to the time of taking away queen-cells, and on the 16th these frames with queen-cells are taken away, and the hive with the queen put down in its place. The hive containing the frames with queen-cells may be put in some new location, and will make an excellent nucleus to raise queens, as the bees will stay wherever they are put. If to be used to start a new colony, it is put on a stand of its own, and built up; but if intended to be used only to raise queens temporarily, and then be broken up, it is put on top of some established colony. All but one of the cells can, of course, be cut out as needed. As a precaution against raising some poor queens, it is well to examine the above about the 7th or 8th of June, and destroy all eggs and grubs not already started into queen cells, because the bees often let grubs remain till some days old, and then start them, and thus raise worthless queens. In the case above we may look for queens to be hatched possibly the 17th, or as late as the 21st or 22d. Thus I believe the best of queens may be raised by the honey-producer without in any way interfering with his crop.

You ask me, on page 231, what I do with the "two or three frames of comb contained elsewhere." They may be used for nuclei, as you suggest, or they may be used again, in the same way they have been, with some later-swarming colony, or used for extracting-combs.

As to the empty space you ask about in the lower hive, it seems they *ought* to build comb there, and at first I filled the space full of dummies; but later I have left the space empty, giving the bees free access to it, and in not one case in twenty is there any comb built, and then none to amount to any thing. I don't know why. I feared pollen in the surplus with so few brood-combs, but have found no trouble, even if only one brood-comb is left. The brood-combs, however, get quite a surplus of pollen.

You ask, "Will they work in a super without their queen, and so many of the brood-combs gone?" I am loth to believe they will work just as well, and yet I have not discovered any difference. In spite of that, there may be a difference, and I wish some one with more time and ability would settle the matter experimentally.

Many thanks for moving in the matter of figures appended to signatures. How I *would* like to see just one number of GLEANINGS with every signature thus embellished! C. C. MILLER, 172-241.

Marengo, Ill., April 3, 1884.

I agree with you, friend M., that we might

afford to pay a very big price indeed for queens, if we could be sure to get all of them as good as the best we have now; but I do not believe it can be done. But there is certainly no one thing of more import than to be able to get good queens in every hive in a good-sized apiary. Raising each year from the colony containing our best, I presume will be our best plan; that is, carefully note which colony gives the largest honey-crop, and get the eggs for queen-rearing from this colony. Your plan of keeping a colony from swarming by moving it frequently, is certainly very ingenious. The idea of saving all the returning bees when the colony is moved away was one we worked on some years ago. The illustration of our Simplicity hive, with the nucleus on a shelf supported by a grapevine-trellis, shows it. The only drawback we found was, that when queens were allowed to take their wedding-flight from this location, they were sometimes attracted by the humming of the large colony below, and got into the wrong place. I presume your idea in keeping egg-producing colonies thus weak is, that you may be able to take eggs any time, without any inconvenience. I do not really like your plan of cutting combs so much, although it has some advantages. Why not put a whole frame of comb in the middle of this colony, and when the queen has raised just a few eggs, remove it and put another in, and so on? I presume your objection would be, that it robs them of their freshly gathered pollen, for this is almost always put around eggs just laid; and if the combs are left a little too long, it may draw on the eggs and brood more than the colony could well stand. Your present article, taken in connection with the one before it, which you have alluded to, makes your plan of working quite a system, friend M.

HUBER'S WORKS.

"THE LANGSTROTH CLUB."

HUBER'S GLEANINGS:—Every thing relating to Huber's works is of great interest, and should be stated with the utmost accuracy. I therefore read Mr. Viallon's communication with great care; but unless he has the book itself, or has actually handled it, so as to *know* that whereof he affirms, I should doubt the statement that the "Nouvelles Observations" were published in 1792. The best authorities that I can find give 1792 as the date of the publication of "Lettres à Ch. Bonnet." It is, of course, proper to say that the edition of 1796 included the letters published in 1792, and that most of the book consists of letters to his friend Bonnet. But it was in 1796 that the book first took the title of "Nouvelles Observations," etc., and this is the edition which Mr. Benton is now translating. Judging by the translation which appears in GLEANINGS, this edition differs slightly from that of 1814, which is, I believe, the standard. Mr. Benton ought by all means to give up the 1796 edition, and take that of 1814; and as I have two copies of the text, one is very much at his service.

I am informed that there is a supplementary volume, which has been published within one or two decades. I do not happen to have it; but I expect,

ere many weeks pass, to have in my possession a copy of every edition of Huber's works that has been issued either in French, English, or German.

As regards place of publication of the French editions: They seem to have been published simultaneously in Paris and Geneva; at least, this is true in regard to the edition of 1814.

I am obliged to Mr. Viallon for calling my attention to the fact, that the first English translation of Huber's works was published in 1806. My copy is the second edition, 1808. It was printed by the famous printer Alexander Smellie, and was published both in Edinburgh and London—in the latter city by the famous house of Longman, Hurst, Rees, & Orme. So far as I can find, after a good deal of research, this was the only English translation, for both the Edinburgh and London translations are really the same. The editions were: First, in 1806; second, in 1808; third, in 1821; another in 1841. I have not found any trace of any others.

A word in regard to Mr. Benton's translation: I have read it carefully, and compared it with the original. It is decidedly better than the old translation; and for terseness, lucidity, and closeness to the original, can scarcely be excelled. It is a pity, however, that he has used the word "fertile" instead of "fecund," or, better still, "fecundated." The word "mate," used by Benton, is decidedly to be preferred to the word used by the English translator; but "fertile" does not express what Huber means.

In reference to the plates: The engravings were no doubt on copper, and are probably worthless now. The plates in my copy of the translation are from copper. Remember, this was before the adoption of steel for engraving purposes (invented by Jacob Perkins, of Newburyport, Mass., about 1815), and before wood had come into general use on the continent, after its revival by Bewick. If the plates were steel, they can have been preserved only by a miracle. But it will be so easy to reproduce them in wood, with all the delicacy of the original, that this need give no concern.

Mr. Viallon objects to the simple word "Langstroth" as the name for the new book-club, and suggests "Langstroth Bee-Keepers' Club." But it is not a *bee-keepers' club*, neither is it a literary club. It is to be a *book-club*, established for the purpose of republishing such memoirs and works as are now inaccessible to students, and yet are of special value and interest. Who, of all the readers of this article, has read the original papers of Hunter, Schirach, Réaumur, Swammerdam, and others, upon whose works the principles of modern bee-keeping are based? If these could be placed within the reach of students it would be a grand thing. Now, the only way to accomplish this is through a society or club. The chemists joined together for a similar purpose, and formed "The Cavendish Society;" not "The Cavendish Chemical Society," mark you. The medical men have such a society—"The Sydenham Society"—not "The Sydenham Medical Society." Historians did the same, and we have "The Spottiswoode Society." If "The Langstroth Club," or "The Langstroth Society," is formed, every bee-keeper who can read will know what it means. It will not be the first club in this country, however; for since I suggested the formation of a "Langstroth Club," a "Grolier Club" has been formed. This is named after Grolier, a famous book-binder, and is devoted to books and papers on book-binding and kindred arts.

Mr. Viallon will observe, that the edition of 1814 is called, on its title-page, the *second* edition of "Nouvelles Observations," etc.; not so the edition of 1796, which must, therefore, have been the *first* of that title. JOHN PHIN.

Cedar Brae, N. J., April, 1884.

Thanks, friend Phin, for the many items of interest which you have woven into your article. In regard to the date of the publication of the "Nouvelles Observations," we have here an English edition printed in 1841, wherein the translator says: "The publication of his observations took place in 1792, under the title of 'Nouvelles Observations,'" etc.; and further, that *another* edition was printed in 1796. This would seem to confirm what friend Viallon said. Friend Bliss, of Duarte, Cal., informs us that he has just imported a copy of Huber's works from France, and he copies the title-page in "the original tongue." Translated, it reads:—"New Observations on Bees, by Francis Huber. Second Edition, revised, corrected, and considerably enlarged. First Volume. Paris: J. J. Paschoud, 22 Magazine Street, Geneva, the same. 1814." This is doubtless the edition you recommend for Mr. Benton's use.—In the last number of the *Conservateur des Abeilles*, friend Fournier gives the original introduction to Huber's works, which Mr. Benton translated; and on comparing the two, we must fully indorse all friend Phin says in regard to the admirable manner in which the translation has been done. But best of all, friend F. also gives us a fine picture of the venerable Huber. We hope some day to procure this cut for the benefit and pleasure of our readers. Friend F. errs in putting the date of Huber's death at 1832. He died Dec. 22, 1831.

FOUL BROOD.

AN ANSWER TO A QUERY BY FRIEND BOGGS, ON PAGE 81.

HAVING had considerable experience with foul brood in Germany, years ago, and nobody responding to your article and questions on page 81, regarding the same, perhaps I can advise you some in the matter. It will be a comfort for you to hear that, although the colony your bees robbed had real foul brood, your bees will likely escape the disease when it was so late in the fall they had ceased breeding, and the stolen honey (of which there was likely not much) carried in the lower part of the combs for immediate use, will have all been consumed long before brood-rearing is started again. You should not, however, depend on your good chances, but treat them as sick until they are all proved sound, which is to your interest, as well as that of your neighbor bee-keepers; neither should you sell any bees.

As the time is at hand now to look over your bees (if you have not yet done so), in order to keep any affected ones from the rest, each colony should be treated and kept strictly separate; exchange no hives nor combs. By all means avoid robbing; open them only near sunset or early morning, or in quite cloudy weather. In looking for affected cells, take out the center frames, where the queen is supposed to lay first; and where by this time large sheets of brood are hatching. It is in those that an exper-

ceded person can best detect it. If in or about the middle of such hatched sheets one or more scattered cells remain closed, look for them, and see; if their covers are caved in, with a small opening in the center, there is foul or failing brood of some kind, if not the worst. You will not likely find any old enough to have turned to brown jelly as yet. If, on the contrary, no such described cells are found, nor in 10 or 20 days after (at which time they should be looked over again), your bees are likely all right, and an expert with bees and the working of foul brood would have now settled his mind about it. But as you claim to be one of the A B C class, I would, besides the above, adopt a more sure and simple proof, which costs no extra time, and the bees prosper all the same, if they are sound.

After you have proceeded as above, you can add empty combs or foundation to strong colonies when needed, until they have eight, when you should give them no more. You will thus compel all your strong colonies to swarm early naturally, which is a sure proof of their health, and you can then do with them as you like. If any are too weak to swarm, keep them and their surplus separate; and in the fall, after breeding is over, and when you prepare for winter, look all carefully over for any remaining cells, as every bee-keeper should do, and as we always did.

I do not consider it necessary here to describe the way you can best get rid of it, in case you should be so unfortunate as to discover foul brood among your bees, as friend G. W. House not long ago described in GLEANINGS, if I am correct; if not, I will, if you need and desire it. If you can, please find out whether the bees in question surely had foul brood; and, if possible, where and how it originated.

Philadelphia, Pa.

C. H. LUTTGENS.

A SPECIALIST.

A MEDLEY OF THOUGHTS FROM FRIEND MARVIN.

MESSRS. Langstroth, Quinby, Heddon, and Root, are no more specialists than some of our would-be beginners. The capacity of keeper, with locality and other fitting circumstances, will produce the entire specialist. The times and conditions are at hand in many locations, and lack but one, or at most two points, to produce them in others. How are they made? The man who has to sell his surplus honey is not a specialist. The two who used to spend their winters in social discourse on their speciality, were nearing the point. One of them used to sell surplus bees; now, by doubling and other ways, he stops the produce of new bee-keepers. We should like Mr. Q. to make sections; R. to publish papers; D., fdn.; G., presses. I will raise honey as I have done for thirty years, and improve the bees that gather it, so as not to be a "specialist." Uncle Sam has many acres unoccupied; a keeper places stock enough to take the feed going to waste on the field. Is it policy to place too many on the same field, or go beyond the unoccupied place? The fittest will survive. Who succeed best? Is it always the specialist?

Mr. Langstroth was a good inventor, but too modest to be a good salesman, as was Mr. Otis—who was a specialist who has done more in his time to introduce the use of the movable principle than all others combined. How many points do the above parties lack of being specialists? The humane society

of this State will not allow the misuse of stock, by starving or otherwise. I therefore advise not to run the risk, but "go west," as others have, who could not compete. Is it best to advise the thirty bee-keepers who used to try to keep bees in this place, to go in again, and ruin or lose as they did, and do now in other places? If Mr. P. wants to show how easily he can succeed, let him come in my range, and fail, as one of us is sure to do; or let him earn or buy the range or route, as other trades do; i. e., the milk routes; start fair, and lose less.

Wanted, an apprentice to learn to be a "specialist."
J. M. MARVIN.

St. Charles, Ill., Mar. 23, 1884.

Friend M., we are much obliged for your suggestions, even though they are dropped in a little abruptly, some of them. But we should be glad indeed to have you tell us something about your yield of honey during the past season, and how you secured it. You strike one point there that ought to be considered. The beginner would not be likely to succeed in your immediate neighborhood. It is just so with us. Our 400 or 500 colonies during the height of honey harvest cover our fields so well that those who try bee culture within a mile of our apiary are apt to stand a rather poor chance. On this account I believe most of them have moved away or given it up.

THE INDIANA BEE-KEEPERS' ASSOCIATION.

WE BE BRETHERN.

IHAVE waited for some one to send you a report of our very interesting meeting held in Indianapolis, Jan. 15 and 16; but as nothing has yet appeared in GLEANINGS in regard to that convention, I beg for a little space, just to tell your readers that our fifth annual convention was well attended, from 75 to 100 being in attendance, the most of whom are members. The discussions were lively, and generally of interest to all present; and although, as usual, there was a difference of opinion on some points, yet the tone of the discussions was in the spirit of "We be brethren." If any other spirit prevailed, I failed to discover it.

On the afternoon of the second day we had an address by Gov. Porter, who, for the past three or four years, has favored the meetings by his presence. Perhaps a "new departure" was the election of Mrs. Robbins, of Indianapolis, for president. As a body of busy "workers," why not have a "queen" to rule us? C. F. Muth, of Cincinnati, was there, as he always is, and he never fails to come with valuable information, and just such advice as will benefit all progressive bee-keepers. In marketing their honey crop, our Indiana producers have learned, and are practicing one very important point; that is, to sell their honey as near home as possible, putting it on sale in the towns and cities around them; and it is astonishing what an amount is sold in that way. Statistics gathered by the assessors show the number of colonies in this State one year ago to have been 78,000; this year will show a very large increase. The entire proceedings of our convention will be published in pamphlet form, and you will no doubt receive a copy from our worthy secretary, who is doing much to keep up the interests of the association.

And now, Brother Root, I want to ask you in time,

to meet with us next winter; and I hereby earnestly request that you arrange matters so that you can be with us, if possible, if we are spared to see that time, and we promise you shall have no such experience as you had at the Columbus Convention. See page 88.

JONAS SCROLL.

Lyon's Station, Ind., March 18, 1884.

Friend S., your report is just to the point. Nothing would give me more pleasure than to meet with you; but I am afraid to make promises so long ahead. I suppose you mean by that last sentence, that you won't have intoxicating liquors sold, right under where the convention meets. I should suppose not, if you have a lady to preside. May God bless the new departure!

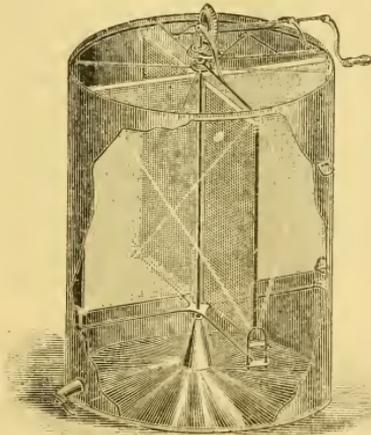

AUTOMATIC HONEY-EXTRACTOR.

WE send you a cut to-day of our automatic honey-extractor. You may copy the description of it from the *A. B. J.* for April 2. G. W. STANLEY & BRO.

Wyoming, N. Y., April, 1884.

We give a description of the extractor as directed, as follows:

I would like to describe my honey-extractor, which not only takes the honey from four combs at once, but also reverses or changes sides with the combs, after one side has been extracted entirely, by reversing the motion of the crank. The comb-baskets, or pockets to hold the combs, are made of wire cloth, large enough to contain the size of the comb used, with sufficient space inside so that the combs may be conveniently placed in the comb-baskets, without injury to the combs.

A HONEY-EXTRACTOR TO REVERSE THE COMBS WHEN THE MOTION IS REVERSED.

As the machine stands at rest, the comb-baskets, hanging from the outside of the reel, point directly toward the center. The top of the reel is made by an iron cross attached to a hoop that will just revolve inside the can. Midway between where the arms of the cross are attached to the hoop, are fastened four small metal hooks, to support the four comb-baskets. The bottom of the reel is made with a cross, like the top, with the exception of having a cross-piece at the end of each arm. Two holes are

drilled through these cross-pieces near the ends, three inches apart, and through these holes are passed the two rods of an arch, which rises three inches above the cross-piece. A vertical rod passes through the two crosses at the center. The pinion to connect with the cog-gear wheel at the top is placed near the top of the rod with the end of the rod running through the pinion and into a bearing in the casting that forms one of the bearings for the crank shaft. The bottom of the vertical rod rests on a cross-bearing at the bottom of the can. The lower cross is fastened to the vertical shaft, by means of a set screw; after which the upper cross is turned, so that the hooks come directly above the center of the arches at the bottom of the reel; the top cross is now secured to the vertical shaft by another set-screw.

To make every thing secure, and also to form the sides of the reel for the comb-baskets to swing against, we provide as follows: Take a strong galvanized rod, and fasten one end to the hook at the top of the corner of No. 1, and the other end to the bottom of corner No. 2; now take another rod and run from the top of corner No. 2 to the bottom of corner No. 1; fasten securely at the ends, and at the center where the two rods cross. When all sides are provided for in this way, the reel is complete.

The comb-baskets are made to slip on to the hook at the top, and at the bottom they have a double croch that fits the arch at the lower corner.

As the extractor stands at rest, the comb-baskets all point toward the center, and the crotches rest squarely against the rods of the arch at the bottom corner.

As the reel begins to turn, the comb-baskets are all thrown off the vertical center, and all pass around in one direction, resting on one rod of the arch, and take their place against the sides of the reel.

As the comb-baskets pass around to the sides of the reel, the edge that hung next to the center will be carried upward about one inch; hence, as soon as the motion stops, the weight of the combs and baskets carries them back again, pointing toward the center. By reversing the motion, the comb-baskets are carried around in the opposite direction, and the honey is thrown from the other side of the combs. By applying the "brake" to the pulley near the upper end of the rod, the motion is again stopped, and the combs again swing back, pointing toward the center, and the combs are removed.

In order to make the action of the comb-baskets more rapid, we attach one end of a small coil spring to the bottom of the comb-basket, and the other end to the rod of the arch on the same side. This holds the bottoms of the comb-baskets in place, and aids in bringing them back to the center more quickly, so that they will be ready to remove as soon as the motion stops. The extractor will work well without the springs, but time will be saved by using them.

The above device for reversing the combs is certainly quite ingenious, friends Stanley & Bro.; but I hope you will excuse me if I suggest some of the objections that occur to me. While I am about it, perhaps it may be well to say, that our columns are always open to descriptions of new inventions, improvements, etc.; and where the articles possess merit, I am quite willing their owners insert advertisements in the same issue; or they may give prices in the reading columns, if they choose. But if they use our columns

for this purpose, they must accord to myself or any of our readers the right of commenting on these improved implements, and pointing out the difficulties, or such difficulties as suggest themselves to us. This, it seems to me, is no more than fair, in view of the fact that a great crowd of beginners in bee culture are looking on and are oftentimes ready to adopt every thing prominently noticed. It is always best to be a little careful in adopting new things; and therefore new inventions, as a rule, have to go through this ordeal of public criticism. If they possess sufficient merit to bring them into public favor in spite of such criticism as they may receive, well and good. If the sale of them is hindered by what may be brought out, the proprietors will have to bear it. I make this little preface right here, because owners of new things have so many times felt hurt at what I thought best to say by way of comment.

The automatic extractor shown above is the most ingenious thing of the kind that has ever come under my notice, although I have not seen a finished machine; and although the engraving is quite defective in many points, so far as showing just how the machine is to be made, still it enables us to understand it fully. The great objection to this machine—in fact, all machines I have ever seen, for reversing the combs inside of the extractor, is the great size and weight of them, compared with the machines already in use; this great size and weight involves a corresponding expense. In the above machine each comb must have room to hang between the center-shaft and the outside of the can. To do this, and have it take all sizes of combs in common use, the extractor will need to be something like 2½ feet across the top. To revolve so large a reel, capable of holding four combs, correspondingly heavy gearing must be used; and the power required to get so heavy a frame in motion, and stop it quickly, will be considerable. I should like to hear from some one who has purchased one of these machines, and tried it in actual use. All arrangements of the kind, so far as I know, have been, after a little time, discarded; and if this is a success, I am inclined to think its use will be mostly confined to specialists, or those who have quite large apiaries.

HOW TO CURE A KICKING COW.

SOME EXCELLENT SUGGESTIONS BESIDES, IN REGARD TO THIS MATTER OF CRUELTY TO ANIMALS.

FROM the number of communications that have come in, in regard to this matter, we judge more people know how to use cows than practice what they do know. From among the number we select two—one from a veteran (or we should judge so), and also one from one of the juveniles. This will be all the space we can give to the subject.

In GLEANINGS, page 203, you ask, "How shall we cure a kicking cow?" For the cure to be permanent, you should educate the cow so that she would have no fear. There are different methods to obtain that result. One method would be, teach the cow to

eat from your hand. Use a card on them, and once in a while give them something they love, from the hand, while carding them; scratch their head with your fingers, and afterward their neck and shoulders; teach them not to shrink from your touch, by passing your hand carefully over all parts of their body and legs. Teach them not to be afraid of a bag or a blanket, by hanging a rope or cord first across their back, then something larger, till you can pick up a blanket lying near them and throw it over them as you do a horse. Then take two pieces of cord about three feet long; hold the ends even, and make a knot on them about 2½ inches from the center, then make a knot on the longest ends, about five inches from the other knot, and then draw them tight; then take one end of the two cords, and pass each end once around one of the cow's hind legs above the ankle, and tie a good slip knot; then tie the other leg the same; now, very slowly and carefully, handle the cow's bag and legs till she is no longer afraid. Always remember, that a *naturally* vicious cow is aggressive, and uses nothing but her head in making an attack, unless she is frightened or hurt. All bad tricks, as a general thing, are caused by mismanagement, either at the time of their contracting them or afterward. Never strike an animal, nor hurt it in any way, while angry, if you can avoid it, and *never* in revenge for what they may do. It is to no one's credit to do so. It will not help the matter, neither is there any "money" in it. Be slow and very gentle in all your movements while it is required. In milking, you can not use too much care not to cause pain to the cow in any way. If there are any cracks on the teats, or the skin is more than usually tender, use extra care, and I should hope a cow so treated could in a short time be milked safely, as far as kicking is concerned.

I believe it is important in the management of animals of all kinds, to *feel good natured yourself*, if you want to be successful, and believe it is more or less disastrous to lose full control of the temper. One should always strive to give an animal some knowledge of what you punish it for. For example, a touch of the whip when you wish your horse to go faster will teach him to obey. So will it quiet a restive one, if he understands for what reason you strike him. But if he does not understand it, it will surely make him worse. I suppose a simple cord, instead of the hobbles wound around the leg would answer the same purpose after the first week or two.

ARNOLD WYMAN.

Montezuma, N. Y., March 17, 1884.

As Frank M. wants to know how to break a kicking cow, I will tell you how my pa did. He tied a rope around her body behind her front legs, and put a stick in it, and twisted it up so tight that the cow did not think of kicking. He did so for a week, and she has not kicked since.

Atwater, Ohio, April 7, 1884. CHARLEY GRATE.

You see, friends, the great secret of managing animals, as well as managing any thing in this world, is to first manage yourself. Friend Wyman hits it exactly when he says that the great secret is to feel good natured yourself, for you know good nature is contagious.

He that hath no rule over his own spirit is like a city that is broken down and without walls.—PROVERBS 25: 28.

He that overcometh, and keepeth my works unto the end, to him will I give power over the nations.—REV. 2: 26.

SENDING HONEY TO COMMISSION MEN.

A MATTER ON WHICH BEE-KEEPERS SHOULD BE THOROUGHLY POSTED.

BROTHER ROOT:—Mrs. Axtell was rightly informed by her lawyer. It is a reasonable thing. If a commission agent sells your goods he is a trustee for you, and merely holds the goods or proceeds as a bailee (as the law terms it), or simple custodian. If he sells the goods, and uses the money for other purposes, and does not hand it over to you on demand, he is guilty of "conversion," or embezzlement, which is a crime. If the creditor or principal accepts a note instead of the money, he makes it a simple debt, and settles the original claim, and removes the criminal part of the affair. If the note is sued for non-payment, the creditor gets a simple judgment, which is of no more value against a dishonest man than a note or a verbal promise to pay. I agree with you, that to go to law to collect debts is a questionable business, and at the best a losing affair. But to prosecute a thief is a public duty. Did not our gentle Savior make a whip, and drive the thieves out of the temple with it? and the law is the whip we must use to keep men honest (?) who would be rogues otherwise. And a commission agent who sells your goods and pockets your money is a thief in the eye of the law. Therefore, never take a note from a commission agent in payment (?) of a debt, due for goods sold. The rogues know what it means; and when the note is given, snap their fingers at you; but not one has been known to refuse to pay (here in New York) when a full settlement has been demanded by a lawyer. I am not a lawyer, but have had practical experience in getting money from such commission men.

Hackensack, N. J., March, 1884. H. STEWART.

Friend S., I quite agree with you in this matter. There is one other point not yet touched upon. It is this: Suppose a commission man makes a plea that he was obliged to sell honey for less than half what it was worth. In friend House's case they pretended they could not get even ten cents a pound for nice comb honey. I presume in such a case we could demand a statement of the sales made, and by investigation find out what amount of money was received. In the case we now have before us, the commission man had a way of selling out and losing his books every little while, so friend House informs me.

NUCLEUS METHOD OF INCREASE.

THE WAY FRIEND POPPLETON DOES IT.

MR. RUSSELL, of Wakeman, O., has requested me to describe in GLEANINGS the method I use in forming nuclei; and as the subject is a timely one, I will try to do as he wishes. I do not think that I have any thing new to say on this subject, but I may be of some help to those who have had little or no experience in working with nuclei.

I came to the conclusion several years ago, that there are but two methods of increase that I am satisfied with. Those are "natural swarming," and what is known as the "nucleus method." Which of these two methods is the better, depends altogether on our method of management. If I were raising comb honey, I think I should prefer natural swarming; that is, I should probably be forced to prefer it,

as it is much easier for the comb-honey raiser to allow than to prevent natural swarming; but using large single-story hives, for the production of extracted honey only, compels me to rely on some other method of increase, if I wish any. I have tried nearly all the methods of dividing colonies that have been given in the books and papers, but have never yet found a way that was satisfactory.

Nearly if not all the ways of dividing colonies result in giving the old bees to one of the divisions, and the young bees to the other, thus destroying the normal condition of both divisions, and this usually has to be done during a flow of honey. The part having all the old bees has very little brood, and has to devote two or three weeks (usually during the best of the season) to brood-rearing instead of honey-gathering, while the other part has too few field-workers to be of much value as honey-gatherers. These objections would not be very serious ones in localities that enjoy a continual flow of honey for 3 or 4 months; but such localities are few and far between in this northern latitude.

The nucleus system of increase allows us to keep our colonies always in a strong, normal condition, ready to take full advantage of any flow of honey. We can also do the most of the labor of making and caring for the nuclei during intervals of more pressing work.

The great practical difficulty in making nuclei is to get a sufficient number of bees to remain with the nucleus during the first few days after it is formed. A perfect nucleus should be a miniature copy of a normal colony; that is, should contain a laying queen as soon as it is possible to give one, and a *proper proportion of old and young bees.* This last condition is the difficult one to obtain, and I know of no practical method of doing so, except by forming all nuclei from colonies kept at a distance of at least two or three miles from where they are to remain. I have practiced this way somewhat, and expect to do so almost altogether hereafter. Any one who has not tried it can hardly realize how much better such a nucleus is than the one formed by any method from a colony near by. However, as nearly all nuclei are necessarily made and kept in the same apiary with the parent stock, I will give the method which has given me the best satisfaction, and which of late I have used quite extensively.

I use altogether, long single-story hives, capable of holding any number of frames up to 25. During the season for making nuclei, these hives always have in them some combs that do not contain brood. I make all my nuclei by the use of standard frames, not using any smaller size especially for that purpose. Selecting the colony I wish to take a nucleus from, I place an empty hive near it, placing in it either one, two, or three frames of the oldest capped brood the colony contains, with all the adhering bees. I usually make it a point to see the old queen, so I can be sure she is where I want her. I then add to the nucleus hive, from the old one, as many combs with adhering bees as I have taken brood-combs. Fill the empty places in the old hive with empty combs; close up both hives, and remove the nucleus to the stand previously prepared, where it is to remain. I keep the nucleus hive closed up till the next morning, then open the entrance-blocks till only one bee can pass at a time; set a small board or shingle up in front of the entrance, and let them alone for a day or two, after which the empty combs (which have now become useless) can be removed,

and a queen or queen-cell be introduced if necessary. The nucleus can now be used for rearing queens, or can be built up into a good colony, by occasionally inserting empty comb, foundation, or brood-combs from other colonies. The further a nucleus is removed from its parent colony, the more bees will remain with it. I rarely remove a nucleus less than four or five rods, and more than that if possible.

I believe this method I have detailed is all old, unless it may be the temporary giving to the nucleus as many empty combs with their adhering bees as I do brood-combs. Since using this method I am rarely troubled by too few bees remaining with the nucleus, but they are, of course, nearly all young bees.

Mr. Doolittle lately told how he forms his nuclei by covering a frame of hatching brood with wire cloth, and leaving it in the center of a populous colony; but it seems as though that must certainly be a much more troublesome method than the one I use, and gives poorer results, with the one exception of introducing the queen, which I do not think is anywhere near of sufficient importance to pay for the extra labor.

O. O. POPPLETON.

Williamstown, Iowa, March 29, 1884.

Thanks, friend P. Your method differs but little from the one we practice, only we greatly prefer to have a comb containing a queen-cell nearly ready to hatch, when we start nucleus colonies. The bees on this comb, and, in fact, all belonging to the same hive, will stick pretty well, as a rule, to any comb containing a mature queen-cell. You know that friend Doolittle suggested taking the old queen along a day or two, to make the bees feel satisfied, and stick to their location. Putting a shingle before the hive, we have never practiced; but it may answer an excellent purpose by inducing the bees to pay more attention to places out of which they go. If a good many of the bees go off with the colony, there will usually be enough hatched by the time a young queen is ready for business, to make a pretty fair colony. "Neighbor H." practices carrying the bees about three miles from his River apiary to his Home apiary.

AN A B C SCHOLAR ASKS QUESTIONS.

HE FINDS SOME THINGS HE DOESN'T UNDERSTAND.

DON'T your A B C scholars bother you mightily? I believe the "little fellows" are generally a troublesome class. Well, I am at the foot in the A B C class, but I suppose that we shall have some more new scholars before long; and then, as I profit so much by the lessons I get from GLEANINGS and experience, I think I won't be at the foot much longer. For the present, however, I am going to presume that you, like all good teachers, sympathize with all fresh arrivals; and now, as I have secured your sympathy, I am going to ask you a few questions that I presume will appear so simple you will laugh at our ignorance. Before doing this, however, I want to tell you what I saw while watching some bees during a warm day in February. I had put some nice sugar on the alighting-board in front of two hives that I had bought and brought home in January, and after moistening with water I took my seat just in front of one of them, and was watching them sipping at the sugar, when, all of a

sudden, two bees grasped each other and seemed to be engaged in a deadly conflict. This lasted only a second or two, when they released their grasp, one of them flying away, the other one remaining motionless near the outer edge of the alighting-board. Supposing that the one had been killed by a sting from the other, I thought no more about it until a few minutes later, when another bee that had walked away from where the group was feeding on the sugar, chanced to pass the one that had been slain in battle. Suddenly he stopped, turned around till he faced the motionless body of his comrade, and then commenced such a series of maneuvers around and against its inanimate body, that I supposed it was going to pitch the dead overboard. Shortly he was joined by another, and then another, and another, until there were six of them surrounding this apparently lifeless body, all of them engaged just as the first one had been; but to my surprise they would never allow it to be pushed near the edge of the alighting-board, although they kept it continually moving. Imagine my surprise to see this apparently lifeless bee, after being thus "manipulated" for a minute or two by its fellows, suddenly regain consciousness, take wing, and fly away. While meditating on what I just witnessed, I passed to the other hive, where I saw the same thing enacted again, with the exception that the motionless body of the bee was lying on the alighting-board when I first noticed it.

Now, is it any wonder that, when my A B C book arrived a few days after, I just turned right over to "R," to see if there was any thing in that book about "Resurrection." Won't some of you professors tell us something about it? I should probably have stated, that those manipulating never passed over the body of the inanimate, nor changed their relative positions, nor turned the body over, but kept it continually moving. Now for my questions:

1. Is there any thing to be gained by feeding bees that have plenty of honey in their hives, throughout the winter?
2. If you had a 2-story Simplicity hive, and there should be half of the top frames full of honey left, after the winter is over, would you remove this surplus, say the 1st of April, or would it lessen the chances of an increase by natural swarming?
3. If I should set one Simplicity hive over another, thus making a two-story hive, would it not be well enough to make an entrance for the bees at the bottom of the top story, or would it give more light to the inside of the hive than the bees would appreciate?

If you will please answer through GLEANINGS, you will confer a great favor on a new beginner.

Sparta, Miss.

L. HALL.

Friend H., I should say that your imagination supplied a little, perhaps, in the account of the adventures you mention having seen. You gave the bees a feed, and this, with the warm weather and outdoor air, stirred them up into a feeling of general rejoicing. The buzzing around each other, and other antics, was simply their way of manifesting their satisfaction. I do not think there was any stinging about it. In regard to the bee that appeared to be dead, I do not know how to explain it, unless it was one that had got chilled so as to be in a dormant state, and perhaps got

pulled out on the honey-board, and the warm sun revived him, and his comrades gave him a lick of the warm sugar they had just been feasting on, and that "brought him to." Bees get well very suddenly under the influence of sunshine and feed. You saw the same maneuvers at different hives, because the warm weather had called them out.

IS IT AN ADVANTAGE TO FEED, WHERE STOCK HAVE PLENTY OF FEED?

In regard to your question, I should say there was something to be gained by feeding bees, even when they have a good supply. It must be done judiciously, however. During a dearth of pasture in the fall, regular feeding will induce raising bees largely, and even swarming may be induced in this way. What is called stimulative feeding in the spring will often cause the bees to raise brood to such an extent that the amount of honey gathered may be doubled or trebled.

In regard to your second question, it is very bad policy to leave such an amount of stores in the hives, that full combs of honey will remain in April. It should have been extracted the fall before, or it can be used for stimulating stocks by shaving off the caps of the cells. This will have about the same effect as feeding. Taking it away would not lessen the chances of swarming; but if given to them one comb at a time, uncapped, as I have mentioned, it would induce swarming.

SHOULD THERE BE AN ENTRANCE TO THE UPPER STORY?

One entrance is sufficient for any two-story hive, and I believe it is thought better to use the entrance at the lower part of the lower story. If you make an entrance in the upper story it allows the warm air to escape, and the bees will soon abandon the entrance and in time the combs of the lower story.

FRIEND CHURCHILL'S IDEAS IN REGARD TO GETTING COMB HONEY.

ALSO SOME SUGGESTIONS ABOUT GETTING BEES STARTED IN SECTION BOXES.

FRIEND ROOT:—As there has been so much said about the trouble of getting bees into the boxes, I will give you my mode, which I discovered last season, which pleases me more than a little. I begin early stimulative feeding; and as they grow in numbers I add frames of comb or fdn. till just 9 fill an L. hive, which will space them, say, $\frac{3}{8}$ or more, which is more than natural. Now being thus, there is room for lots of bees—more than is actually needed; but they are just what we want, you will see. As the brood gains, and the top of frames are bulged and crowded with honey, which is coming in freely, I shake bees from the combs and trim the honey off even with the frames. The first frame is set $\frac{3}{8}$ in. from side of hive, and others are set just $\frac{1}{2}$ inch apart; the last one has a division-board (athin one) set $\frac{3}{8}$ from it. I put on a case one section narrower than the regular size, and only half of the boxes in this, which I set at the back end. The open space is filled with cloths. The trimmings are mashed, and the same amount of warm water added, which is all strained through a cloth, and placed on top of the sections, in a feeder. I cover

warmly, and on this I put a leaf or chaff cushion, so as to keep warm during cold nights, and cool during warm days. Now, the combs being closed up to about the natural space, and the honey being above the sections, the bees have a very friendly invitation to accept them; and there being but a small number of boxes, they will take to them far better than in a large open crate. When the honey is all taken down, take off feeder, and keep on the packing; and when the two sets of boxes are well started, I put one set forward, and place between a set of boxes filled with foundation, and so on; and when they get strong enough, I lift this and set a crate under.

"But," says one, "why do you use so few boxes?"

My friend, have you ever measured a regular 28-lb. case? If so, you have found it will hold 16 quarts, or one-half bushel. Now, where are there bees enough in one swarm (in early honey-flow) to fill this and care for the brood, and do smart work in the field? I find, also, that bees do far better in boxes in a chaff hive than a single-walled, unless a woolen cloth is tacked on the edge of one story, so that no air can creep in about the case. Then they are much better, to be heaped together; for if left open, and a full case is given at once, the bees are driven into the center, and many combs are drawn on one side, and are apt to be crooked thereby, and many outside boxes are rejected entirely.

I find, also, that unless the edge of the lower glass edge is chamfered down to nearly an edge, that the bees can not get into the case from the side of hive, which is just so much loss. Just set on a case, Bro. R., and see where we have had our eyes shut. I now chamfer every one, and I also set the boxes away from the side of crate $\frac{1}{2}$ inch, so the bees can pass up and down freely, on outside sections; and I saw enough last season to satisfy me that 1 $\frac{1}{2}$ sections are too wide, and shall use none but 1 $\frac{1}{2}$ x 4 $\frac{1}{4}$ x 4 $\frac{1}{4}$, regardless of weight.

The above ideas are from careful study and experiments; and if they are of any use to any of the happy readers of GLEANINGS, they are free.

As to section fdn., I find that it should come within $\frac{1}{4}$ inch of bottom, and $\frac{1}{8}$ inch of side of boxes, and that a high side-wall makes a very great difference in regard to acceptance by the bees, and I know that we can not be too careful in fastening it in the center of sections, and leaving it straight and even. Some say I am too particular; but I don't see it. The little things are what tell, as the bee said when he took the lion in the nose. I often think of your careful way and watchfulness, and feel that you are entitled to great rewards for your constant labor and care. I also believe that unventilated sleeping-rooms, and tea and tobacco, are ruining thousands of our friends. Give me good air, and lots of hot water, inside and out, and the medicine may go to grass, in company with tea, rum, and tobacco.

E. P. CHURCHILL.

North Auburn, Me., March, 1884.

Friend C., I am hardly prepared to indorse your plan of having your brood-combs further apart than the bees would naturally build them; still, it may be an advantage. When bees are rearing brood largely in spring, you will notice they almost always have a solid frame of pollen right opposite a frame containing young larvæ; and as this pollen is used very rapidly to feed the young larvæ, it seems to me it ought to be within

reaching distance. Suppose somebody were to move your plate two feet away from you while you are eating your dinner, would it not take you some time to reach this extra distance for every mouthful? While I am on this subject, I want to mention that swapping combs so as to put this pollen away from the brood it is intended to feed, is, in my opinion, an awful big blunder; and yet beginners often do this, and may be some older ones do the same thing. Your idea in regard to starting bees under a few sections, to commence with, is a good one. I also approve of your plan of packing around the honey-boxes with cloths or chaff cushions. I have often thought of a case holding about one-half the number of sections to start in with, then using two cases side by side to cover the whole top of the side after they get well started. Such cases would be handy for retailers as well. In regard to making provision for bees to get up along the outside row of sections, I do not feel so sure it is so absolutely necessary. I think we agree pretty well on pure air and pure water.

SPREADING COMBS INTELLIGENTLY.

I do not intend to convey the idea by the above, that I would condemn spreading the brood, only that it should be done intelligently. When the colony gets strong, and the queen begins to be cramped for room, putting a nice straight worker comb, or even a sheet of fdn., in the center of the brood-nest, may work wonders, for the queen will fill this new comb right up at once, almost solid with eggs. These larvæ will hatch almost at once, and the bees can attend to them with greater economy than is often possible with the natural order of things. When the comb is first put in, of course it will make a little disturbance; but by the time the larvæ are ready to be fed they will have pollen placed conveniently alongside of this comb; and when this one frame of brood is hatched out it will make a pretty fair swarm.

WINTERING BEES WITH A THREE OR FOUR INCH SPACE UNDER THE COMBS.

SOME FACTS FROM EXPERIENCE, BY H. L. BOSS.

I COMMENCED the spring with two swarms—one Italian, one hybrid; increased to 9 by natural swarming. I had 150 lbs. in 1-lb. sections. The season was any thing but favorable, so wet and cold, and then so dry. I put them up in November; got dry-goods boxes; got some 2x2 scantling, sawed the length and breadth of hive, laid them in the bottom of my boxes, and then set the hives on them. This gave them two inches from the bottom, the full size of hive for ventilation, cutting a crevice through the box so they could pass out and in; had no upward ventilation. I filled up the box with dry forest-leaves.

We have had steady sleighing for 70 days; to-day the snow is going away, and on examination I find all my bees in first-class condition. I think one quart would cover the loss of all that have died. We had some weather at 25° below zero. Many bee-

men in these parts have lost heavily, some losing nearly all. One man put up in chaff-packed boxes, 46 swarms; he tells me he will lose more than half. Another had a hundred, and will lose about 75, and so on. Those that did not pack have lost very heavily.

My experience has been, keep your bees quite dry and warm, with room under for ventilation, and they come out as well as any. I think from present observation, bees will be fearfully thinned out in these parts.

H. L. BOSS.

Caro, Tuscola Co., Mich., March, 1884.

Friend B., this subject has been much talked about, and I believe a great deal experimented on. I believe favorable results have almost always followed where a considerable space has been left below the combs. With the Simplicity hive we might put an empty story under the brood-nest, but perhaps there might be too much room, and hence too cold. With a chaff hive we could easily raise the frames up a couple of inches, and leave the entrance open full width, and it would prevent choking up around the frames and entrance with dead bees.

HOW AN A B C SCHOLAR HAS PROGRESSED.

SIX YEARS IN TEXAS.

I HAVE been a reader of GLEANINGS for a little over a year, and think I have gained much useful information from the articles of your many able contributors, and also from the A B C book. While I have enjoyed the writings of friends Hutchinson, Heddon, Jones, Langstroth, and Miller, as well as many of the lesser lights, very much, I must say that friend Doolittle has a happy way of making things plain that render his articles of especial value to an A B C scholar.

I commenced keeping bees in the spring of 1878, with one weak colony, which was a gift from a neighbor, and "Quinby's Mysteries of Bee-keeping," old edition, as my guide. I just exactly doubled my stock every year until 1883, after deducting all losses. Last year I got only 10 swarms from 32 colonies. I have sold honey every year except one, 1879, and have always kept plenty for family use. In 1882 I sold 1000 lbs. from a spring start of 14, and increased to 37. In 1883 I sold about the same amount from a spring start of 32, and increased to 42. Until last year I made all of my own hives and frames, and my bees have cost me very little. With the exception of the year 1879, they have paid very well for the labor given them.

I am aware that the above report will appear like very "small potatoes" by the side of some of the "whoppers" that I have seen in GLEANINGS; but as some of the friends are particularly anxious that the dark side should appear, as well as the bright, I thought it was a good time for me to come in, as I did not have any thing extraordinary to report. Now that I have got into so good company, I hope to have a good report too, at the end of this season. It is to be hoped, at any rate, that the late discussions on the "dark side of bee-keeping" will have the effect of making the friends send in all their reports, both good and bad.

J. P. CONNELL.

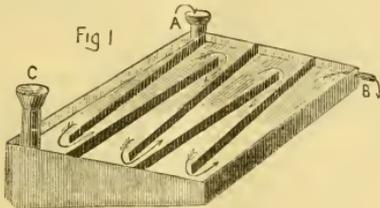

Hanover, Hill Co., Texas, March 21, 1884.

EXTRACTING HONEY

While it is Thin and Unripe, and Evaporating it by Artificial Means.

FRIEND MARTIN TELLS US HOW TO MAKE THE APPARATUS.

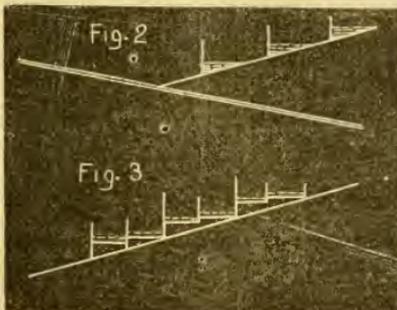

PRO. ROOT:—You have doubtless seen, from time to time, notices of Mr. L. C. Root's honey-evaporator, especially in the *Apiculturist*, and in the proceedings of the N. E. N. Y. B. K. A., as published by Mr. Locke. As there has been some inquiry about this apparatus, and not much definite information given, I shall take the liberty to give a description of it as I saw it at the residence of Mr. Root. It is a simple apparatus (shown in this sketch), made of tin, with an inclined top. Upon this surface are tin strips to guide the honey in a zigzag course down the incline, as shown by the arrows. The *new idea* is to extract the honey, or nectar, before it is capped over, or just as fast as the bees collect it. In this thin, unripe condition, it is run over the evaporator, entering the tube A, and running out at B, ripened.

APPARATUS FOR EVAPORATING THIN HONEY.

If I understand Mr. Root, he does not wish to get a greater quantity of honey, so much as he does a better quality. Honey can be evaporated down to any degree of thickness, even to hard candy, I think, with this evaporator.

The tube C is used to fill the tank with water; a thermometer is also placed in this tube, to graduate the temperature; the heat is maintained with an oil-stove.

FRIEND MARTIN'S SUGGESTED IMPROVEMENT.

It will be noticed, that the shape of guides causes the honey to run down the incline in a thick stream, as shown in Fig. 2. The evaporator would be more rapid and even, I think, if it were run down in a thin sheet, giving more surface.

I would suggest this improvement, and shall use one constructed on the plan of Fig. 3. We hope many bee-keepers will try Mr. Root's plan during

the coming season; for in many experiments we can come to a definite conclusion as to its value.

JOHN M. MARTIN.

Hartford, N. Y., March, 1884.

Many thanks, friend M., for your description. No doubt much honey that is taken out unfit for market might be, with this machine, worked over into a nice article, especially if it is so treated as soon as it is taken from the hives. I confess, however, that without having had any practical experience in the matter, I should be inclined to say the bees could do it cheaper than it could be done by the above apparatus, although I may be mistaken here. I have ripened thin honey by placing it on shallow pans, exposed to the open air, and I know it changes it very materially; and if the weather is dry and warm, it does not take very long either.

FROM THE SAND AND SAWDUST REGION.

A VISIT TO SOME OF THE BEE-KEEPERS ALONG LAKE MICHIGAN.

DEAR GLEANINGS:—Thinking a few notes by the way might be of interest to your readers, I inclose them. From the growing city of Muskegon, abounding in sand and sawdust, the greatest lumber-producing center in Michigan, if not in the entire North-west, I took the C. & W. M. R. R., March 7, arriving at Hart, the capital of Oceana county, at 10 A.M. It is a pleasant little village, located among gently rolling hills and vales in a fine farming country, timbered with maple, beech, elm, and linden. What a fine country for bee-keeping! was my first thought; and not long after, I was sitting by the pleasant fireside of friend Markham, listening to his terse and sly encomiums upon the "busy bee." Mr. M. is a staunch believer in cellar wintering, and well he may be; for success has always attended his methods. A small farm in the outskirts of the town, planted to orchards of plum, pear, peach, and apple, affords him a comfortable living, while his bees are bringing in a nice surplus of revenue.

My next visit was to the apiary of Henry Palmer, a mile east of the village. Mr. P. is largely interested in bees, and has, in connection, a supply department of no small dimensions. A visit to the winter quarters of the "blessed bees" showed me 120 colonies, stowed snugly away in an outdoor cellar, in a side hill, where the temperature is kept at 48° to 54°. The entrance is left fully open, as in summer, while the honey-board is pushed back about two inches. Here the bees seemed to cluster, showing their appreciation of the arrangement made for ventilation. Mr. P. has had wonderful success with this plan of wintering, which is substantially the "Adam Grimm" method, I believe. Mr. P.'s bees were purchased directly from the great bee-master of Wisconsin, and from his own lips Mr. P. learned many valuable lessons in the science of bee culture. Mr. P. puts no faith in the utility of early or cleansing flights, and his bees will remain close prisoners till the flowers of early May proclaim that spring has come to stay.

The following day, friends Markham and Palmer, and myself, rode four miles to visit Mr. Stanhope, one of the most successful fruit and honey producers of this section. His bees were snugly stored

in cellar; but we missed the anticipated visit, as Mr. S. was absent, and we were obliged regretfully to depart without seeing him.

I left Hart and my hospitable friends behind, quite inclined to believe a warm cellar the normal winter home of the bee—at least, in the northern portions of our country.

At Fremont I had the pleasure of meeting Mr. George E. Hilton busily nailing his favorite double-walled *dry sawdust* packed hives, in a shop at the rear of his apiary, a pleasant view of which the readers of GLEANINGS have seen. Friend H. is an enthusiastic, as well as a practical and successful bee-keeper, as his neat apiary of 70 colonies, snug and warm in winter hives, fully attests. A peep into several of these showed fine strong colonies, bees bright and healthy, with plenty of surplus stores.

As we walked to the depot the following morning after bidding my hospitable entertainers good-by, Mr. P. showed me two nice new uncapping-cans, just received from Medina, Ohio. They were certainly beautiful, as well as convenient, and I am sure will form a portion of my own outfit as soon as circumstances will allow me to indulge my inclination.

Now, Mr. Editor, to sum up: Upon leaving my cellar-wintering friends, I was decidedly converted to their side; but the visit to friend H. has again unsettled me, and I am still open to conviction as to the best methods of wintering bees.

Mt. Bliss, Mich., Mar. 17, 1884. L. S. BENHAM.

Friend B., I am glad of your report on one account; and that is, I wanted to know how our friend Henry Palmer liked his wintering cellar. I visited him the first year he built it, and I have asked him for a report, but he does not seem to like to write for bee-journals. If all had so nice a place as he has to make a cellar, I do not know but I might go stronger on cellar wintering. Right at the side of his apiary is a sandy knoll, and the sand of Michigan is a little nicer than that in any other part of the world I have seen. It is perfectly dry and nice and clean, and our friend gets a frost-proof repository without any of the dampness and mustiness we usually have in our clay soils.

CALIFORNIA.

ITS PRESENT PROSPECT FOR A GOOD HONEY YIELD.

UP to the 27th of Jan. we had had only five inches of rain, more than half our rainy season then being past. Many of our people began to dread another dry season; but on the 27th it commenced raining, and since that has given us 15 inches. This is enough to make crops almost a certainty for the coming season; and you may be sure the mails have been any thing but a certainty for the past three weeks.

To-day, the 18th, the rains amounted to a real flood. Ventura Creek went over its banks two miles above our town, and it was a mixture of anxiety and amusement to see it tear away our fences, cut off communication with the hills, some men carrying their women to higher grounds, every one splashing through the water to catch such things as were about to be washed away. I have large quantities of drift wood in my orchard and garden, but my 100-bbl. tank for rain water sat on my wagon close by

my new house, not being quite able to get it under the spout in time for the nice rain water.

San Buenaventura, Cal., Feb., '84. R. WILKIN.

STILL LATER, AND WORSE.

Since writing you last, I find that our flood of January 17th was much more destructive than we had thought. Many bees were washed away. My neighbor McKee says he saw his 140 hives all start down stream in five minutes' time. The road to my Matilija apiary of 300 hives, has been so destroyed, and the cañon filled up that I have yet been unable to get to where it stood. It is generally supposed to be all washed into the ocean; and if not, that it will cost \$2000 to make a road to it.

At my Sesse apiary, pictured in your A BC book, it washed away my barn with its contents, a part of the dwelling-house and its contents, the two sides out of my honey-house and shop, taking cans and tonnage for perhaps 40,000 lbs. of honey, many tools, and things stored away, including 600 lbs. of beeswax and the foundation-mill for the L.-S. frame, which I got of you, being the first one of the kind introduced to this country; about \$700 loss there. It came close enough to take only two hives of bees from that apiary, leaving about 700, and now if it were not for the great confusion in swarming, I would leave the whole lot there this season, to test how so many bees would do in one place, with 1200 hives more within two or three miles of them.

But with all this loss of, say, \$2700, I would take it every year for the sake of the rain, rather than take chances on no rain. It is remarkable, the force of a mountain stream here like the Sesse, 20 feet deep, dashing worse than the cataract of Niagara. Here it carried a rock that two hundred horses could not haul, and dropped it in front of my apiary.

San Buenaventura, Cal., Mar. 3, '84. R. WILKIN.

PEA-VINE, OR MAMMOTH RED CLOVER.

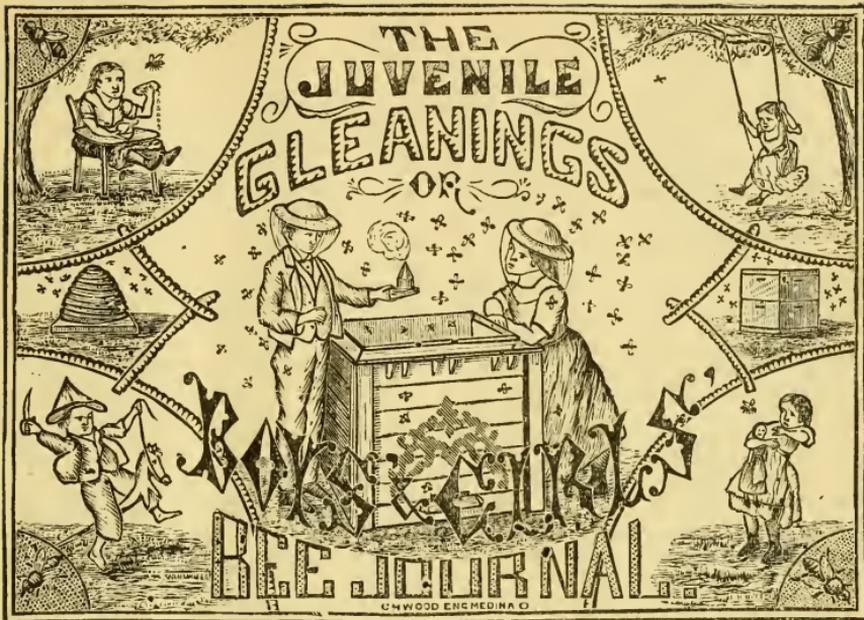

A DISCOURAGING WORD FOR IT, BUT A GOOD ONE FOR ALSIKE.

NOTICING your offer to send seed of the mammoth clover to all applicants, I thought (for the benefit of bee-keepers) I would give you my opinion of it, having grown both kinds quite extensively, for hay and pasture, also for honey. I want no more of the mammoth. I think one acre of the alsike for hay is worth 2 or 2½ of the former; for pasture, 1½ or 2 of the former; for honey, 5 of the former. Perhaps results are different in different localities. Of course, friend Root, it is none of my business; but permit me to suggest, that you offer the alsike the same as the mammoth, free, in small packages, and confer a lasting benefit on bee-keepers and farmers, as well as yours truly.

N. E. DOANE, 38-60.

Pipestone, Mich., April 2, 1884.

Friend D., the reason we offered samples of the pea-vine free, is because there is such a diversity of opinion in regard to its value for honey, while with alsike there is no diversity. It has been suggested, that the mammoth in one locality is not the same as in another; therefore we send out these trial packages of seed. Recent articles seem to indicate that mammoth has some advantages over the alsike. It seems to me you are putting it pretty strongly in favor of the alsike, are you not? It *does* seem to be steadily growing in favor, which is good news to bee-keepers.

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR?—LUKE 10: 29.

All the trees of the field shall clap their hands.—ISA. 55: 12.

A LITTLE way from the "Home of the Honey-Bees" lives a neighbor, of whom I have spoken several times. He used to keep bees somewhat, but he has finally given it up. I sometimes laugh at him for having dropped them, for he always made them quite profitable. Well, this friend, some like myself, is given to hobbies; or, perhaps, a better way to express it would be to say that he takes hold of one subject at a time, and studies it and pursues it most vehemently. When he first commenced to study bees he wanted to see a straw beehive; and as no one around here had seen one, he determined to go to the Centennial at Philadelphia, mainly to see a straw beehive. Of late years he has been studying maple-trees and maple sugar. In fact, it was friend Clark who furnished the little maple-sugar cakes I have been selling you, and this year he had got so much taken up with the business that he rented another large sugar-bush besides his own, making in all about 700 maple sugar-trees, and then he bought one of the latest improved maple-sugar evaporators, and one day in March he told me that I had better come over and see his sugar-camp. I went over myself, and was so well pleased with the surroundings that I told the hands about it at the noon

service, and finally we all went over, nearly a hundred of us. As we came into the woods the girls scattered here and there, looking for the first little spring flowrets peeping through the dead leaves. But I was most taken up by the tinkling of the drops of maple sap as they struck on the bottom of the new tin pails hung up against the trees scattered through the woods.

The sap had just been gathered; and, in fact, one of the secrets of neighbor Clark's success is in gathering and evaporating the sap just about as fast as it runs from the trees. A large tin can is set on a sled, and this is drawn around through certain paths in the woods, and the sap is poured from the pails into this, when it is drawn up to the boiling-camp. By means of a stout windlass and proper chains, the large tank is lifted from the sled, and poured into huge tin vats up under the roof of the boiling-house. From these tin vats the sap runs into the boilers. To prevent its running too fast, however, a hollow tin can, or float, is placed on the surface of the heating-boiler, and the rising and lowering of this regulates the flow of sap. After it is heated and skimmed, another automatic faucet runs it into one of the long boilers, and it goes through this in a zigzag course (not unlike the diagram shown on page 267), so arranged that, while sweet sap is running in at the one end, maple syrup is ready to run out at the other end; and as it is all boiled in clean bright tins, being at once strained through cloth

strainers, and skimmed several times, the result is a maple syrup about as white as honey, and with that wonderfully beautiful, delicious, maple flavor that makes one think of the woods and his boyhood home.

Well, at one stage of the operation there is an apparatus for removing what they call silica. This is nothing more nor less than fine white sand, or white flint, you might term it. How could sand or flint get into maple syrup? When neighbor Clark told me it came out of the sap, I was a little incredulous, but I had to give up; and while studying into the matter it occurred to me that this flinty matter was carried up by the sap to make new limbs and new wood. Did you ever know, children, that straw is composed of flint? How else could a light slender straw hold a ripened head of grain without letting it tumble down and break off? Is there anything in the world that will hold so great a weight, and yet weigh so little of itself, as the straw that holds the ripened head of grain? Nature is a great economist. To have the grain ripened, it must be held up above the damp ground, and exposed to the breezes, and light of the sun. A support must be built for it, and it must be built quickly and cheaply. What other materials can be found so stiff and strong as this same flint, held together by the glutinous matter and vegetable fiber that forms the straw? The wheat-plant carries this flinty matter up into the pores of the straw, and builds this wonderfully strong and beautiful structure. The maple-tree, in the same way, rears its head among the surrounding trees of the forest; and to get a strong stock with as little expense and labor as possible, it weaves into it considerable flinty matter. Burn a piece of maple wood, and you will find the flinty stuff left in the ashes. This flinty material is carried up by the sap, from the soil. The sugar that goes along with it is for nutriment, or food, if you choose, to make the young buds and new leaves; and the forces of the tree are hard at work building and preparing materials just exactly as the bees in the hives are hard at work building, or at least getting material ready for new combs and young bees. The bees go off into the woods, and gather pollen from the soft-maple, just as the tree sends down in the ground for flinty material, and manufactures sugar to feed the buds.

Did it ever occur to you, that the economy of a plant or tree is strikingly like to the economy of a bee-hive? If a comb is broken in the hive, the young bees collect materials, and weave it together so it is as good as ever. If you drive a wagon against the maple-tree, the bark is broken off and injured. The tree goes to work, however, to build it up and fix it smooth, so as to leave nothing but a scar; and about the Fourth of July, if you look you will find the tree has done a pretty nice job. You break your leg; the forces of your body go to work to mend the broken bone, leaving you nothing but a scar. You know the process is going on, but you have nothing to do with it, only to keep still and eat food containing sugar, flinty matter, and materials required to fix the bone just

right. Your appetite, if it is a natural one, tells you what to eat. One day it says, "Give me some pickles, or something sour;" another time it says, "We want quite a lot of sugar to work on, or some honey;" and again, "Give me some meat, and three or four good slices of bread and butter. We will tell you when there is enough." Now, the maple-tree, the hive of bees, and the healthy growing boy, are arranged somewhat after the same plan or pattern. We can pull the tree to pieces, and study its system somewhat; but we can not put it together again. Neither can we pull a boy to pieces, and see how that bone is built up again—at least, we wouldn't want to; but we can look into the bee-hive, and see all about how it is done, and know of God and his works. Now, the bees enjoy this building up, as I have explained to you in the A B C book. We know they are happy while they are doing it. A boy enjoys growing and learning, I hardly need tell you.

Yesterday Huber was cross all day, his mother said. She couldn't please him any way; but toward night she carried him over to the factory, and I carried him around among the machinery. You ought to have seen him twist his head, and wonder and look, and open his eyes in astonishment, and especially when he first caught sight of the engine, and then he "watched the wheels go round," seeming to take in, by a hurried glance, the manner in which one wheel turned another wheel by means of a leather belt between the two. I knew he enjoyed it, and my mind ran swiftly back to the time when I first went with my father into a machine-shop. When I carried him back to his mother he whopped over to me, grasped me tightly, and kicked his heels to indicate that he didn't want her at all, but much preferred to stay with me. He enjoyed seeing things move, and he enjoyed the exercise of mind it took to contemplate and understand these things. Now, then, do the maple-trees enjoy bringing up flinty matter, and manufacturing sugar out of the starch, making buds and leaves and blossoms, and all that sort of thing? I think they do, little friends, for we read in the sacred word,

The mountains and the hills shall break forth before you into singing, and all the trees of the field shall clap their hands.

HOW I BECAME A BEE-KEEPER.

FRIEND DOOLITTLE TELLS THE JUVENILES HOW TO FIND BEE-TREES IN THE SPRING.

WHEN about sixteen years old, while boiling maple sap one day in the fore part of April, about two o'clock in the afternoon I got a little lonesome; so, placing a good lot of large wood in the fire, so that the sap would be kept boiling for some time, I started off for a neighboring sugar-camp, about a mile distant. As I neared the camp I stopped for a moment to see if the owl was in the woods anywhere gathering sap, as I did not see him near the sugar-house, or boiling-place. As I stood listening and looking for him, I thought I heard the hum of bees; and on looking up into the tree-tops all about me, I presently saw the bees taking their first flight in the spring, from a hole in a large bass-

wood-tree, some seventy feet from the ground. When I found the owner I showed him what I had found, and he kindly told me that I'd better put the initials of my name on the tree to keep any other party who might claim it as their "find," from cutting it. He also said that I'd better let it remain till the coming fall, when he would help me cut it for what honey he could eat.

I felt proud of my "find," I assure you, and also grateful to the owner for being so kind to me. The bees seemed to be very strong in numbers, as the air was full of them all about the top of the tree. I was loth to leave them, but did so, resolving that the next pleasant day I would try going all through those woods, and look for bees. When such a day came I started out; and, to my great satisfaction, I soon found another, which I marked in like manner as I did the first. Since then I have found several colonies in trees by simply passing through the woods on warm days in early spring, and looking into every tree I mistrusted might be hollow, so as to make a nesting-place for bees. As there are no leaves on the trees at this time of the year to bother, the bees are easily seen by walking so as to look toward and a little under the sun.

Well, about the end of September my neighbor and I cut those trees and obtained about 100 lbs. of honey after it was strained, as I told you in my last article. Of course, I gave the neighbor all the honey he wanted to eat at the time of cutting the trees, and also some after mother strained it.

During the following winter I saw an advertisement in one of the newspapers, stating that if any one was desirous of learning how to hunt wild bees, he could do so by sending 75 cents for the "Bee-keepers' Text-book," and addressing H. A. King & Bro., Nevada, Ohio. Still having my success of the spring before fresh in my mind, I sent for the book; and not finding such instructions on hunting bees as I expected in it, it was laid one side without further reading, in a closet where books and papers were kept. Six years now passed, when, for some reason, I chanced to hunt in this closet and pick up this same book. As I saw the preface was short, I read that, as I always do the first thing in any book. I at once wanted to know all there was in the book, and sat down fairly "spellbound" till the last page was read. I at once decided to have some bees in the spring, as this was in January, 1869, and accordingly I engaged two colonies of a bee-keeper living a mile distant, for five dollars each, in box hives. I also purchased "Quinby's Mysteries of Bee-Keeping," and read and re-read it till I could tell all the substance of the book by simply turning to the index. Then I subscribed for the *American Bee-Journal*, which I read with great delight.

When spring opened I got my bees home, bought five L. hives, all complete, for \$12.50, and considered myself well equipped for the season. I could hardly wait for summer to come, I was so anxious to see the bees fly every day; and many a cold bleak day in April and May I would go and tip up those box hives to see the bees clustered between the combs. In fact, I wanted to be with them constantly, yet withal I had a great fear of their stinging me, as my flesh always swelled badly when stung — so much so that I was often confined to the house, from my eyes being swollen shut, or a limb so badly swollen that I could not walk on it. For this reason I always bundled up well, if I went near the bees when they were flying. As it came near the swarming season, I re-

membered what Quinby said in his book about being able to tell about the time they would swarm, by inverting the hive in the middle of the day, and with a little smoke driving the bees out of the way, so that the sun might shine down between the combs, thus revealing any queen-cells that might be started on them.

Not wishing to keep watch of the bees all the while, I thought I would see if I could tell any thing about it. So I bundled up with veil, overcoat, and mittens, and prepared for the siege, for I so feared the stings that my wife said I made more fuss than I would if I were going out to face a bear. I often wonder that I persisted in working with the bees when I so feared them. But so it was; and after getting stung several times pretty badly, I found that each time the pain and swelling grew less and less, till finally I dropped all but a veil, which thing I still wear, as a general thing, when at work with the bees.

To return. With "fear and trembling" I blew a little smoke under the hive, and inverted it, blowing smoke from a roll of cotton rags (no improved smokers then) upon the bees, and, to my surprise, I found queen-cells nearly ready to seal over. In a few days this hive cast a swarm which was safely hived in one of the L. hives. That was the only swarm of the season, as 1869 was a very poor year for bees.

I now had a swarm in a frame hive, and these I "overhauled" every few days till I became familiar as to how the combs were built, the larvæ fed, the time from the egg to the perfect bee, etc., all of which every bee-keeper should be thoroughly acquainted with at the outset.

To sum up. In the fall I had one full box of honey (6-lb. box), and two partly filled from the colony which did not swarm, and three colonies of bees, to which I fed \$5.00 worth of sugar to insure safe wintering, as the season was so poor that most of the colonies not fed starved before spring. I was offered 50 cents per lb. for the completed box of honey; but as I wished it myself, I did not sell it, even at that figure. I bought another swarm in the fall, and had one given to me which had no honey. This I fed, and a recapitulation showed an outlay of \$35.00, with nothing to show for it, except the one box of honey, two partly filled and four empty hives, and five colonies of bees to run my chances on through the winter. Infatuated with the bees as I was, I now resolved that I would never lay out a single cent more on them, unless they first earned it for me; believing that, if I could not make four pay, I could not four hundred. This I held to, so that my bees never cost me more than \$35.00, and have earned me my home and all I now enjoy, besides paying their way. G. M. DOOLITTLE.

Borodino, N. Y., April, 1884.

I believe, friend D., you are putting emphasis on a pretty good point in your closing up, and that is, that beginners should be careful about investing very much money in bees before the bees pay it back; but to do this they must, as a matter of course, build up slowly, and this course of action will be our most efficient remedy against blasted hopes.—Our juveniles can go right to work now and try their eyes at bee-hunting. In some localities there may be light snows. If they can go out through the woods just as the sun comes out after one of these snowstorms,

the sight of a dead bee in the snow will be a pretty sure indication of a bee-tree near by, for the bees generally bring out dead bees and rubbish almost every sunny morning. The advantage of early spring is, there are no leaves on the trees, and the eye will readily scan the trunk of any tree that looks as if it harbored bees.

THE DISCOVERY OF SILK.

COMPILED AND WRITTEN BY MISS NELLIE LINCOLN
ROSSITER, PRACTICAL SILK CULTURIST,
6054 VINE ST., PHILADELPHIA, PA.

Continued.

SICILY and Naples kept it mysteriously for a long time; and not earlier than in the sixteenth century, the mulberry-tree and the breeding of the silkworm were introduced into the rest of Italy, and at first in upper Italy. Emanuel Philibert, Duke of Savoy and Piedmont, contributed the most to it; and those countries are also indebted to him for the introduction of the olive-tree. From thence, that new source of national wealth was transplanted into the Milanese, and the greatest part of Italy; and very soon that country became the principal seat of silk-fabrication.

Its propagation through the other countries of Europe was quite as slow. At first, their inhabitants seemed to be satisfied with admiring and valuing the silk stuffs very highly. It was only in the year 1180, under the reign of Henry II., that such stuffs, imported from China, began to astonish the English. At a later period, the Greeks supplied France and Germany with these products, which countries, in the Middle Ages, received them from the manufactories of Italy. Charlemagne wore about his linen doublet and under-garment a silk scarf around his waist. Not sooner than in the Middle Ages did the sumptuous silk cloaks, embroidered with gold and silver, worn by the knights over their more martial equipment, come into fashion. History mentions, as examples of extraordinary splendor, that Henry III. assembled, at the marriage of his daughter with the king of Scotland, a thousand knights attired in silk. Charles VI., of France, in order to display his magnificence, wore, from the year 1422, constantly, a black velvet coat-of-arms, even in the hottest days. His successor, Charles VII., wore at his entrance into Rouen, in 1449, a beaver, lined with velvet, which was the most costly and elegant head ornament known at that time. In 1485, orders were issued in Germany against such expensive apparel; and females were expressly directed not to wear more than "four costly dresses" at the tournaments; and a whole suit of silk and gold was altogether prohibited to them. Even Charles V. took off his little velvet hat, at an inspection of his army in 1547, "to prevent it from being spoiled by the rain." The silk stuffs still continued to be imported from the East and from Italy; but the first knitted silk stockings, which Henry II. wore, and which attracted extraordinary notice, came from Spain; and Henry VIII., as well as Edward VI., were likewise supplied from that country with the same article, for their personal use. No silk manufactures existed as yet in France or Germany; and not earlier than 1455 did females begin to spin and sew with silk in England; and in 1482, narrow stuffs and ribbons began to be manufactured

from raw silk, imported from Italy. In 1521, silk-weavers emigrated from Milan into France, where, likewise, some attempts were made to weave Italian silk; but all these were but partial experiments.

BEAUTY IN ALL GOD'S WORKS.

ALSO SOMETHING ABOUT THE WAY PEOPLE MOVE
AMONG THE MOUNTAINS OF CALIFORNIA.

DEAR JUVENILES:—Did you ever think how many beautiful things God gives us? "We can not see any," some of you say. Well, that is just what I am going to write to you about. I want you to look at the nearest thing to you that God made, and look for beauty. If it is not in the form of the article, it may be in its color or expression. You may be looking at a weed or a blade of grass, a dog, horse, cow, or a tree. Is there not something about it nice, pretty, or even beautiful? I find beauty in every thing; and if you have the word in your mind when you are looking, you will be sure to find some, and you will also find that your life is more beautiful by your search for beautiful forms. Even work will be made pleasanter by your search. When you are washing dishes, hoeing the field, or making or doing any thing, you will find it much easier to do, if you are thinking, "How nice they look!" and I am sure Mr. Root would not have to complain of half-heartedness if every one would learn to look for beauty in every thing. Try it, little ones, even for one week, and I am sure you and all about you will be made surprisingly happy.

I think I must have written it badly, for I find in my last, that the pronunciation of the name of those lovely falls was put in wrong; it is "Nah-hah-we." Say it quickly, and see how musical it sounds. It is an Indian name.

I am going to tell you of a moving I assisted at a few years ago. We were living in the mountains. Our nearest neighbor lived two miles from us. I started to visit them on horseback, as that was the only mode of travel, besides walking. When I arrived near the house I found that they were preparing to move, and they were glad of my help; but I laughed so much at first, I was not much good; for right before the door were three horses, tied to one another's tail. The first one had a feather bed and a wash-boller evenly balanced across its back, and two kettles and a frying-pan around its neck, and the master was carrying out a bedstead, with the intention of tying that on the middle horse. It was so funny! but as they were in a hurry, I managed to work and laugh too. Well, we packed the bedstead with a lot of bedding on No. 2, and then proceeded to No. 3. On it were put a small trunk, several bundles, and three chairs. Then there being no side-saddles, a man's saddle was put on a horse. The wife was helped upon that, one baby in her arms, and a little fat chubby boy seated behind her. My boy and myself on another horse finished out the funny procession, the master leading the way, and all following. We climbed a good-sized mountain, and then down, down we went for half a mile, so steep a mountain that I felt very much afraid I should fall over my horse's head every moment; but we all managed to arrive safely at the foot, and we were transferred to a wagon waiting for us, partly loaded with things that had been taken down on horses before my arrival. We went down a narrow cañon about three miles, and then I had my first

view of this lovely valley, Los Alamos, where I now am living.

MRS. HILTON.

Los Alamos, Cal., April, 1884.

Mrs. H., I thank you for your suggestions in the opening of your article. Last evening our pastor told us at the prayer-meeting, that some great sculptor always saw an angel in a block of marble. Now, we may, if we choose, see something good, if not angelic, in humanity all around us; or we may be so selfish and uncharitable as to see nothing but something to find fault with. Which is the better way? We may, as Pope says, see

"Sermons in trees, books in running brooks,
And good in every thing."

And do you notice how this thought runs into the one I have expressed on another page? The prophet Isaiah seems to be telling how the world ought to look to one who loves God. See page 270. And again,—

Let the fields rejoice, and all that is therein. Then shall the trees of the wood sing out at the presence of the Lord, because he cometh to judge the earth.
—1. CHRON. 16: 32, 33.

YOUNG PEOPLE'S MEETINGS.

"A LITTLE CHILD SHALL LEAD THEM."—ISA. 11:6.

A GENTLEMAN in talking to a school, once asked the children to guess at what age he first began teaching school. They guessed at ages from 17 to 30; but he surprised them by saying at the age of seven. At that age his father was a missionary in Jamaica, and his sister was teaching. His sister being sick, he supplied her place for a little time, and in recitation he said he had each one "toe the mark" by marking a straight line for their feet. That gentleman is now making a straight path with his feet by stepping in line wherever there is work for him to do, and has dedicated himself and his money to the Lord. He prospers, and the work he is engaged in prospers, reminding us that the Lord honors those who honor him. We may not be called to lead great minds; but whatever we do influences others to a greater or less extent. You know it is said, that "a little child shall lead them." So let us see in our leading, that we find the green pastures. Let us not run in evil ways, for fear some one might follow. Let us not follow those who start in the wrong direction; and for fear we might be led astray, let us take Christ for a leader, and say, "Where he leadeth we will follow."

I wonder if any of the young folks who read GLEANINGS have a meeting all their own. In our city we have one, where from 50 to 75 attend. We read and sing and pray and talk; and if any one has ideas to exchange, or thoughts to suggest, as to the best mode of conducting these meetings, or promoting the interest in any way, we think it would be quite profitable. And if you have no such meetings, I think if you will ask for some one to lead you, that you will be as greatly interested in the success of your meeting as our young folks are.

We have our city districted off, and two leaders appointed for each district; so it is not very burdensome for each to see to the number in his respective district. We are just organizing, and hope to increase the interest and number. E. M. Anderson, Ind.

We thank you for your suggestion, friend E. M. The work you have spoken of is

much like that in our own town; and since these young people's meetings have increased from an attendance of three or four to a hundred or more, the influence on our town of perhaps 2000 population has been wonderful.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Oil, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye, takin' notes;
An' faith, he'll print it."

THERE is a very great lot of letters this month, children, and I have crossed out a great part of those we have used, and a good many that I have not been able to use at all, and there is still a larger number that we shall not get to at all, probably. Now, as I do not want to disappoint you by not seeing your letters in print, I think I will not talk much myself this time, so here we go for the little letters.

LETTER FROM A 6-YEAR OLD BEE-GIRL.

I am a little girl six years old. I go to school and read in the First Reader. EFFIE BELL HENRY.
Gratten, Kent Co., Mich., Feb. 11, 1884.

A SMALL LETTER FROM A LITTLE GIRL.

I am a little girl 6 years old. Papa keeps bees. I have a little brother two years old. Please send me a book. JENNIE KIRKPATRICK.
Sandwich, Ill., March 18, 1884.

A PRINTED LETTER FROM A SIX-YEAR-OLD.

I am a little boy five years old. We take GLEANINGS. I go to Sabbath-school. Brother said he would help me print a letter, so I could get a book. Hanover, Mich., Jan. 6, 1884. CLYDE E. HALL.

HOW TO MAKE HONEY VINEGAR; FROM A SIX-YEAR OLD.

I will tell you how to make honey vinegar. We put honey in rain water, and let it stand till it is sour.

CLEMENT BRICHNER.

Deorah, Iowa, March 22, 1884.

A SHORT LETTER FROM MATIE.

Papa has 75 swarms of bees in the cellar. I like honey to eat. I have a pet bird named Nellie, and a pet hen named Edith. This is my first letter.

MATIE M. TALCOTT, age 8.

Owego, N. Y., March 8, 1884.

A COUPLE OF LITTLE LETTERS FROM A COUPLE OF LITTLE BROTHERS.

I have a little brother five months old, and he has blue eyes; he can sit alone. I went to school one term.

CORA KRANER, age 6.

Geneva, Ind., March 30, 1884.

We keep bees, and they have all wintered well. They have been gathering pollen for two weeks. It is just fun to stand and watch them come in. They are working on maple.

AUSTIN KRANER, age 10.

Geneva, Ind., March 30, 1884.

OAK-GROVE APIARY.

We live in a grove which is sometimes called the Oak-Grove Apiary. I like to work with the bees, and I like honey, though last year was not a good honey year at all. Almost all of our neighbors have a few bees. I have a little brother, and his name is Macy. I should like to see little Huber, very much.

GEORGIANA OSMAN, age 11.

Tehama, Cherokee Co., Kan., Feb. 20, 1884.

FROM 58 TO 130, AND 6200 LBS. OF COMB HONEY.

My father keeps bees. He bought two swarms five years ago, and now he has 112. He has sold a good many. He had 58 last spring, and increased to 130, and got 6200 lbs. of section-box honey, and 800 lbs. of extracted, and it is about all sold that we have got to sell. We have a large farm, but we let it out to work on shares. I like to work with bees.

OBIE BERT, age 8.

Sheboygan Falls, Wis., March 27, 1884.

MOTHER'S BEES.

Uncle Alonzo gave ma one swarm of bees two years ago next spring. The first summer they swarmed once, and made us 35 lbs. of nice comb honey. The next summer they swarmed four times; two ran away. Ma was afraid to hunt the queens and clip their wings. She thought to save them without. We did not get much honey. Now we have four nice swarms, all of their queens' wings clipped.

HATTIE MAY HENRY, age 10.

Gratten, Kent Co., Mich., Feb. 11, 1884.

SOME HINTS IN REGARD TO FDN. MAKING, FROM OUR YOUNG FRIEND CORA.

I am helping my uncle to press fdn. I also help him to dip. I take sheets of wax from the boards, after he has dipped them. Sometimes, when the boards get so rough that the wax sticks to them, we soap them with hard soap, and make the water soapy; and after that we have no trouble till we are through dipping. It helps a great deal. It even helps, if the boards are real smooth.

Ashland, O. CORA H. BAUM.

WHAT BLOSSOMS FURNISH THE MOST HONEY?

My father has four stands of bees, and I have one. I don't go to school. My father lost one stand of bees last fall, by taking them to the fair. I have three sisters and two brothers. Please tell me from what flower bees get the most honey.

WILBUR ENDLY, age 13.

Edgerton, Kan., Feb. 18, 1884.

If I am correct, friend Wilbur, Mr. Doolittle has decided that no one plant gives honey in such immense quantities as does basswood.

REPORT FROM A 13-YEAR-OLD BEE-KEEPER.

I received your smoker, and I think it will do its work all right. I have 23 stands; saved all of them this winter. They made about 400 lbs. of honey, and I sold 250 lbs., and it brought me about \$28.00. Now

I will tell you how I got a start with my bees. My grandpa gave me 12 stands last spring. I sold 7 stands at \$1.00 a stand. Sometimes they are cross and I have lots of fun when I go to hive them.

FRANK J. CRABILL, age 13.

La Crosse, Ill., March 19, 1884.

Seems to me, Frank, selling hives of bees at a dollar apiece is pretty cheap, is it not?

A CALL FOR GERMAN BEE-BOOKS.

My pa has three hives of bees. I like the honey very much. Last summer a bee stung me on the finger, and it hurt. My pa wishes to know if you have German bee-books, because he doesn't know how to take care of bees. He had eight hives last summer, and they died. He would like to know the price of them.

EMMA S. SCHNEIDER.

Braman, Pa., March 29, 1884.

Friend Emma, we have not any German bee-books; but "Jacob" is fitting himself for the difficult task of translating the A B C book into German, and before many years we expect to have it going.

A 26-YEAR-OLD BEE-HIVE.

Pa has no bees, but grandpa has 99 colonies; two smothered this winter. He had 53 stands last year, and got 5075 lbs. of honey, and sold it all at 15 cents per lb. Grandpa has a hive 26 years old, which is the best of all. He got last year 129 lbs. of comb honey and two swarms. I call grandpa, J. G. Kintner; some folks call him "Old Honey." Perhaps he is well named, for he has handled bees and honey for over 40 years. Plan for wintering bees: Pack the hive inside "chuck full" of bees and honey, and the outside with dry chaff, and be sure to keep them dry all winter.

GEORGE W. SHOL, age 9.

Sherwood, Ohio, March 21, 1884.

Now, friend George, I think your plan for keeping bees is a pretty good one, especially the fore part of it. If you call grandpa "Old Honey," I suppose you will be called "Young Honey," eh?

DOES TRANSFERRING BEES PREVENT THEIR SWARMING THE SAME SEASON?

The above question is frequently asked us by beginners. Our juvenile friend below answers the question satisfactorily.

Pa has three colonies. We got a colony from grandpa's last spring, and had them transferred the last day of May. Pa fed the bees before they were transferred. When they were transferred they had about a pint of honey, and had 2 quarts of bees. The man who transferred them said he didn't think they would swarm. They have increased one swarm, and made 25 or 30 lbs. surplus honey. Our bees swarmed in six weeks after they were transferred. The bees kept swarming, and swarmed the most of the honey-season. One day pa destroyed the queen-cells. He bought a hive of Italian bees. We put our honey upstairs, and it froze. Will you please tell us where to put it so it will keep? Pa put our bees in the cellar.

Mosiertown, Pa. BERTIE S. A. SPITLER, age 10.

I think, friend Bertie, you have made us a pretty good report on the subject.—I believe it is laid down in the bee-books, that honey should be stored where it won't freeze nor get damp. We keep it here in the factory two or three years, without injury—comb honey at that.

SUBSTITUTE FOR THE HILL DEVICE.

My papa has 30 colonies of bees. Most of them are in chaff hives. He did not pack them for winter until it began to get cold, and then he neglected to put on most of them the Hill device. Some time afterward, on a mild day, he took out the Hill device to put them on, but he found that the bees had built numerous little wax props, which held the packing off the top of the frames, thus affording ample winter passages, so he did not have to put on the Hill device.

MINNIE DAVIDSON.

Friend Minnie, I have often seen the quilts or pieces of old carpet raised up in the way you mention; where that is the case, I think it will do just as well as the Hill device.

HOW ELLA WROTE THE BEST ESSAY OF THE TERM.

Every two weeks at school we write essays, and one time I wrote on bees, and the superintendent said it was the best production he ever read in that room. Last summer mamma saw a swarm of bees going by, and Frank threw dirt at them, and made them settle, and papa hived them. Papa extracted about 1000 lbs. of honey last season. Papa raises queens every year for sale. A sting does not swell much on me; but one made my sister very sick. I help papa make foundation. I trimmed the edges of the sheets while he made more. I used to help him extract honey also. ELLA EDMISTON, age 10.

Adrian, Mich., March 22, 1884.

A COUPLE OF LETTERS FROM THE FARIS CHILDREN.

Grandpa has about 100 colonies; he has some American hives, but doesn't like them as well as some of his own invention. He thinks they are better than any he ever saw. He is experimenting with reversible frames. If he is successful, you may hear from him, as he gets some of his supplies from you.

ONA FARIS.

Carrollton, Md., March 29, 1884.

I should like to see you, and see your machinery at work. I am afraid of bees, but like honey. I like to see grandpa at work with his bees, but I don't know much about them; but I should like to ride your baby in my wagon.

E. M. FARIS.

Carrollton, Md., March 19, 1884.

Friend E. M., Huber has got a little red wagon of his own, and on the front of it is painted "Hubie." He has also a carriage to ride in, but he likes the wagon better, even if it does jolt and make his little teeth rattle, what there is of them. If any of the family will just say, "Go ride, ride, in waggle!" you will see him jump up in a minute, and it will be all mamma can do to hold him quiet long enough to put on his things. It does not make any difference whether it is night or day, or whether it rains or shines, he is just as happy to go out and ride.

HOW TO SEAL UP MAPLE MOLASSES.

This is my first letter. My pa has 7 hives of bees. He did not lose any this winter. I have been helping him in the sugar-camp. I will tell you how we seal our molasses. We put it in jugs, and dip the corks in molasses, and it keeps just as well as if it were sealed with wax.

CHARLEY GRATE.

Yale, Portage Co., O., Mar. 26, 1884.

Friend Charley, it seems to me the syrup that would stick to the cork would do pretty well. However, I do not think it would be as serviceable as good stout cement put around the cork when the molasses is first

made. Your way it would be so easy for the boys to get in for a taste; but my plan makes it pretty hard to open the jug without letting folks know it. Don't you see?

THE SWARM OF YELLOW BEES THAT ELLA AND HER PAPA AND MAMMA FOUND WHILE GOING TO CHURCH.

We have six colonies of bees. We were going to church one Sunday last summer. About a mile from home we found a swarm of bees clustering on a limb of an oak-tree, right above the road, so we had to stop. Papa went home and got a hive and hived them. They are yellow bees, and are doing well. Papa likes his hive quite well that he got of you.

Meadville, Pa., Mar. 24, 1884. ELLA M. KEBORT.

You see, Ella, if you hadn't been going to church that Sunday morning you wouldn't have found those bees. I hope you started early enough so that taking care of the bees didn't make you very late for church.

GOLDENROD HONEY.

My brother bought a swarm of bees last winter, and got five swarms from it. We took up two swarms, as they did not have enough honey to keep them through the winter. The bees make a good deal of honey from the goldenrod, which we think is better than any other honey they make. Mamma wants to know the best way to make wax.

MARY L. STILLMAN.

Hornellsville, N. Y., March 20, 1884.

Now, Mary, we think goldenrod is the poorest honey, or, at least, our folks won't buy it when it is a cent a pound cheaper than the other. I suppose your ma wants to know how to render wax. I think the wax-extractors described in our price list are the best things to use.

JEANNIE'S PLEA FOR KINDNESS INSTEAD OF SMOKE.

My father is a bee-keeper on a small scale. He thinks he owes you very much for what he knows about bees, through GLEANINGS. He has always been very successful with his bees, getting larger returns without loss, the hardest winters. He packed his bees under a shed, in dry sawdust and chaff.

My father went into winter quarters the 2d of last Nov., with ten swarms; has ten at this date. They are all the product of one swarm since the first day of May, 1882. We extracted from our bees last summer about 2 barrels of delicious honey, and left plenty in hives to winter on; 30 lbs. left to the hive. We use a Novice extractor, purchased at your manufactory in 1881. It is just as good as ever, and has given the best of satisfaction; besides, it was almost one-half cheaper than my pa could buy one for, any place else. He got a Bingham smoker at the same time, but we seldom ever use it. It is a good one, but it makes the bees mad and cross. We prefer to use gentleness and kindness. We think our little pets appreciate kindness just as much as people do, and we can not afford to ill treat such industrious and profitable little slaves as they are for us. My pa says he got more stings the summer he used the smoker than he ever did before or since. I think it is a hard-hearted man who will kill and tantalize his bees with smoke when kindness and gentleness will do just as well, and cost nothing. We keep the beautiful Italians, and they are by nature kind and gentle themselves. Pa thinks I am the best helper he has with his bees.

Napoleon, O.

JEANNIE FISHER.

HOW TO MAKE HARD AND SOFT HONEY-CAKE.

Pa lost 8 colonies this winter. I will tell you how to make hard honey-cake. Three cups of honey, 2 cups of butter, 2 teaspoonsful of baking soda, 1 of cream tartar, 2 eggs. Mix, and roll out thin.

Mombaccus, N. Y. RENNIE MOREHOUSE.

I will tell you how to make soft honey-cake. Cup and a half of honey; 1 cup of butter, 2 eggs, 1 teaspoonful of baking soda, 1 of cream tartar, 4 cups of flour.

ESTELLA QUICK, age 10.
Mombaccus, N. Y., Mar. 24, 1884.

A GOOD REPORT IN WINTERING.

My pa keeps bees; he has 44 swarms; he has not lost any this winter. I had 2 swarms and sold them to pa. I hive the bees when he goes to town.

T. W. HEATH, age 14.
Sherman, Texas, Feb. 5, 1884.

A HOME-MADE EXTRACTOR.

My father has 9 colonies of bees in the Langstroth hive. He reads GLEANINGS. He made an extractor in a big barrel. He used the wheels of an apple-peeler for the gearing, and it did well.

R. A. GARDNER, age 7.
Leesburg, Tenn., March 17, 1884.

FROM 47 TO 100, AND 5000 LBS. OF HONEY.

My pa last spring had 47 swarms of bees, and increased to 100, and we got 5000 lbs. of honey, and we wintered 30 swarms in chaff hives, and the rest in the bee-house.

CHARLES D. CHAPMAN, age 11.
Hicksville, Ohio, March 22, 1884.

SADIE'S GOOD LETTER.

I took an old lady her supper last night. She is sick, and very poor. Pa keeps bees, and I like honey-cy. I know all my letters, and can spell some.

SADIE SMITH.
Greenwood, W. Va., March, 1884.

I am very glad indeed, Sadie, to see you engaged in such work; but I presume your good mother sent you, did she not?

A 4-YEAR-OLD BEE-OWNER.

My pa has 5 swarms of bees, and my little sister 4 years old has a swarm of hybrids, and she is not a bit afraid of them. When they come out of the hive and can't get back in, she will pick them up and put them back. I have to go two miles to school, and I go to Sunday-school. It is a mile and a quarter.

LYONS, O., March 24, 1884. LOUISA E. GREEN.

1700 LBS. OF HONEY FROM 35 COLONIES.

My pa keeps Italian bees—35 swarms; wintered part in cellar, and some outdoors, packed in chaff. All have wintered well; took 1700 lbs. of honey last year. I gather the eggs and feed the hens. My pa's name is Daniel Wright.

A. ERNEST WRIGHT, age 7.
Violet, Ont., Canada, March 29, 1884.

HOW BENNIE GOT HIS BEES.

I found a bee-tree last year. My father made a hive, and put them in it. They are still alive, working nicely. I have two brothers older than myself. We do not use tobacco nor intoxicating drink, so you see we don't have to quit. I want to be a bee-man some time.

BENNIE CHATFIELD, age 15.
Sheridan Coal Works, Ohio, March 23, 1884.

A VISIT TO THE HOME OF THE HONEY-BEES.

My pa has one stand of bees. He and my brother Harry went to see you last summer, and liked the

"Home of the Honey Bees" very much, and the man who kept it. Pa has the A B C book and takes GLEANINGS. I have a yoke of calves that I can work some.

CLARENCE LATHROP.
Armstrong, Ohio, March 27, 1884.

GETTING BEES OUT OF THE WOODS.

We keep bees. We have 3 hives now. We did have more, but one starved, two froze, we sold two, and one was eaten up by the millers. We found our bees in a large tree in the woods. I like to see the bees getting honey, and I like to eat it. We have some nice chickens; they are the Houdans and Leg-horns. They are nice chickens. I am going to raise some. I go to the reading-club every Friday night.

EDDIE ORRELL.
Vernon, Ind., March 9, 1884.

SHOOTING INTO SWARMS.

We have nine colonies of bees. We wintered them on their summer stands. They are in very good condition. One swarm started to run off last summer, while pa was fixing a hive to put them in. I saw them going, and told pa and the hired man, and the hired man got a gun quickly, and shot up among them. Then they settled immediately on a tree. We hived them, then pa gave them to me.

OTTO L. NALE, age 10.
Salem, Ind., April 2, 1884.

The firing into the swarm may have caused them to alight, Otto, but I do not really feel sure of it. I know that many people think that the firing of a gun causes them to alight.

POISON HONEY FROM THE WATER-LILY.

Papa had 40 swarms of bees last fall; but he has lost them all but six. They got honey from lily-pads, and that poisoned them.

RIPLY, Me., March 25. JOSIE F. HOYT, age 8.

I suppose, friend Josie, you mean by the expression "lily-pads," flowers of the water-lily. But it seems strange that it should be poison. Is not your father mistaken in regard to what killed his bees? I have often heard that the water-lily yields honey, but not that it was poisonous.

HOW A BEE PACKS HIS POLLEN, ETC.

My sister Stella and I have one hive of bees. Ma has one, and papa has 26. Papa has made a showcase to sell section honey, like the one he saw in GLEANINGS. I watched a bee loading himself with pollen. He gathered it with his mouth, and put it on his fore leg, then pressed it on his hind leg. He worked in this way until he was loaded.

FRIENDLY, W. Va. NORA WILLIAMS.

Pretty well told, Nora. If you watch bees when they are working in meal in the spring, and you can see the whole operation of moistening it with their tongue, rolling it up with their feet, and then patting it down in the pollen-basket when it is finished.

JESSE AND THE DRONE.

My brother has 3 colonies of bees, and is going to get some more. He likes to work with bees. Once I went to catch a drone, and a bee stung me, and my eye swelled shut, and I could not see for one day.

JESSE M. DAILY, age 11.
Mt. Hope, Kan., March 30, 1884.

Well, my little friend, the laugh seems to have been rather on you than on the drone,

was it not? I suppose you looked sort of funny when you had one eye shut, didn't you? Did you ever see anybody try to laugh when one of his eyes was shut by a bee-sting? You just notice next time, and see if they don't look comical.

THE QUEENLESS HIVE, AND SOMETHING ABOUT GRAY'S FEEDER.

We have two skeps of bees. One is dwindling away; they took out a card of brood comb, and there was neither brood nor eggs. Do you think they are queenless, or what is the matter? We have one of your Simplicity Gray's feeders, and they got the glass to fit the top. They put wire in the place the syrup goes, and sponge in between the slats, to keep the bees from drowning. They were crowding each other, and knocking one another head first into the syrup, and they could not get out. ANNIE H.

Angbrin, Ont., Canada.

I think your hive was queenless, Miss Annie. In regard to the Gray feeder, as the wire cloth sometimes hindered the sliding of the glass, we thought we would omit it; but so many of the friends protested, we have had wire cloth put over them again. This keeps the bees from getting in the way when you are filling the feeder up, and it also prevents pouring feed on to the little fellows, which is especially to be avoided during cool weather. When it is so warm they won't be chilled, they lick it off without very much if any harm.

LETTERS FROM HERBERT AND JESSIE ABOUT THE 50 HIVES OF BEES AND 4700 LBS. OF HONEY.

My papa has 50 hives, and my grandpa has 24 hives of bees. I helped to carry combs for my grandpa last summer, and sometimes at home. We got over 4700 lbs. of honey. We have a high board fence all around our bees. HERBERT FRASER, age 8.

Cumminsville, Ont., Can., March 24, 1884.

Papa is a school-teacher, and mamma has to take care of the bees in the spring. The bees are flying now nicely every day. Pa has been sick all spring, and could not teach. We feed our bees bran, brown flour, and cattle-food, mixed together, and we put syrup in a jar, and turn it upside down on a board with drains in it, and the bees work on it like every thing. I do not like the honey, except when it is candied. Papa makes his own foundation.

JESSIE FRASER, age 11.

Cumminsville, Ont., Can., March 24, 1884.

A pretty good report, children. I shouldn't wonder if the facts you give in the above might be of considerable advantage to some who are new in the business.

GRASS IN FRONT OF THE ENTRANCES.

My father keeps bees, and has two swarms. He puts sawdust around the hives, but the grass grows up through it, and makes it look very bad. I wonder if salt sprinkled on it would stop it.

Ypsilanti, Mich.

LEONARD WARREN.

Friend Leonard, this matter of entrances is one of the great problems. Salt will kill the grass, and keep it down; but it is pretty expensive for 100 hives or more. It is quite an important matter just now, to begin considering something to keep grass and weeds from knocking down heavily laden bees. Pulling the weeds and grass up by the roots will do it, but this is a good deal of work.

The white sand we use around our entrances does pretty well to keep weeds and grass down, together with the pulling.

LETTER FROM THE WINDHAM HOTEL.

Papa is proprietor of the Windham Hotel. It is four stories high, and can accommodate about 100 boarders. We have some boarders all the year round. Papa has 125 hives of bees. He uses the American hive, from which he got about 6000 lbs. of honey last summer. He winters them in the cellar. We have taken your paper nearly ever since the first issue, and we like it very much. Sometimes the Homes department is read aloud in the parlor Sunday afternoons. Mamma was especially interested in one of your pieces which spoke of neckties, for she thought that it was especially adapted to papa's case; and she thinks that if you would write something similar often, it would have a good influence over him. I have a little sister Marian, who is nine years old. We both go to school.

Windham, N. Y.

DORVILLE COX.

Well, Dorville, I think 6000 lbs. of honey is pretty fair even from so large an apiary; don't you? I am glad indeed to know that the Home Papers have been honored so much as to be read in your parlor on Sunday. Seems to me your papa ought to wear a necktie, if he is proprietor of such a great nice hotel, such as I see the picture of on your letter-head.

SOMETHING OF A BLASTED-HOPES STORY.

I am 14 years old, and I help father with the bees. In 1882 he bought 12 colonies; paid \$120 for them; extracted 872 lbs. honey. Poor yield, poor season here. He did not feed up early enough in the fall. He tried to feed in the winter. They all died but one, and that one very near it, and we had 27 in the fall. He bought from you \$26.00 worth of bees by express; received them July 12, 1883, finely done up, very little loss; he gave them Italian queens, made 7 fine hives before fall. He bought 5 more swarms, just the bees, for \$21.50, which made 13 colonies. We then got 8 more that were to be destroyed by sulphur, very late in the fall. We fed them all the granulated sugar they would take, but they did not breed much. They are all alive but one, yet in the cellar.

When feeding last fall, robbing was the general business. The weak ones would have been destroyed, but I took a strip of glass and stopped the entrance, leaving room for only one bee. This completely stopped the robbing.

We extracted 750 lbs. of honey as late as it was, which, at 15 cts. per lb., paid all cost, and \$32.00 to boot.

I have five brothers and no sisters. I should like to show my twin brothers, to compare with your Huber. He must be something extra to beat either of them. They are one year and nine months old.

ALISON BROWN, JR.

Molesworth, Ont., Can., Apr. 7, 1884.

TWO QUEENS IN A HIVE.

Pa has 50 stands of bees. My brother has one, and I have one. They wintered well. It is fun to see them roll and tumble in rye meal. They carried in a good lot in the last few days. My pa says he thinks they come out after the meal when it is so cold they had better stay in the hive. Last fall when pa packed my stock for winter we found two queens.

They were both on one frame, but not on the same side. One looked older than the other. We have not looked at them this spring. They were put away with pure linden honey, and no pollen, and are alive, but are the most quiet in the yard. The wild flowers are just coming. The bees are looking after them when it is so they can fly. I help to extract honey, and look for swarms, and help what I can.

LYLE REED.

Chester X Roads, Ohio, April 1, 1884.

HOW TO MAKE A SWARMING-POLE.

My father and mother have 26 hives of bees, and I have one. My mother gave it to me this week. My bees are in a box hive. My father is going to send for a Simplicity hive. Our bees are near the orchard, and often alight in the apple-trees, and are very hard to get down. Last summer my mother got an old wool hat, tacked it on a long pole, and held it up for the bees to alight on. I think it is a good plan.

LEWIS H. EGBERT.

Sandy Lake, Pa., March 29, 1884.

Very good, Lewis. Any black substance put on the top of a pole, that looks like bees, will usually induce them to settle on it. A ball of black yarn is sometimes used; and to make it better still, some dry dead bees strung on a stout thread, and would around this ball, makes a very good swarming-pole.

3000 LBS. OF HONEY FROM 50 COLONIES.

Papa had 50 colonies of bees. I have one. My bees are the prettiest in the yard. They are Italians. I got my queen of Mr. Brooks. Papa gets lots of bees of him. Papa lost several colonies this winter. We got 3000 lbs. of honey last year. I got 50 lbs. We had 18 colonies, spring out. We extracted nearly every day, and I got tired. Can't you bring Huber over to the bee-keepers' meeting next summer at North Salem? I think it is some time in June. Papa says Mr. Muth, of Cincinnati, will be there, and I think you ought to come too.

GERTIE OREAR, age 10.

Ladoga, Ind., March 30, 1884.

Well, I am very much obliged, Gertie, for your kind words to little Huber. He has never been to any kind of meeting, for the very good reason that he would probably break up any fair-sized meeting of any kind in about fifteen minutes. He breaks up every thing he can get hold of, or that happens to come around, as it is.—It seems to me that 3000 lbs. of honey was pretty well, was it not?

HOW TO KEEP SQUASH-BUGS AWAY.

Sprinkle the plants with air-slacked lime as soon as you see any bugs, and keep them well sprinkled until they get to growing well.

ETHEL F. COFFEE, age 9.

Freeport, Me., March 30, 1884.

Friend Ethel, I think very likely the air-slacked lime will do pretty well; but our bugs do not seem to care very much about it. Prof. Cook recommends in his book, "Injurious Insects," putting shingles each side of the hill, and then pinching the bugs' heads when you find them under the shingles. One of the men who work in the factory here brought us some nice squashes, and I asked him how he kept the bugs away, and he said he had a plan of his own. After a little pressing, he told what the plan was.

He said he put so much fresh cow manure around the hills that the bugs could not stand the smell of it, and so they left the young squash-vines to grow in peace. I presume the bugs all walked off in disgust, holding their noses, very likely, till they got out of the neighborhood. Very likely his application of strong manure helped the squashes to grow, for squashes are rank feeders, and will send out little roots all along the vine, to grab hold of any kind of rich manure that they may find.

AUNT LUCINDA AND GRANDPA LANGSTROTH AT THE CONVENTION.

I am the little boy Aunt Lucinda saw at the convention. I saw lots of folks there—Messrs. Hutchinson, Heddon, Newman, and others; but I did not see you. You ought to have been there, and seen Aunt Lucinda kiss Grandpa Langstroth, right before us all. They all laughed, as if they wished they had been in grandpa's place. Papa took our bees out of the cellar the 20th of March—175 colonies; put in 187 colonies the 20th of Dec. I am afraid of bees. I like to take a handful of drones, and make the girls think they will get stung.

DANIEL WEBSTER.

Blaine, Ill., March 25, 1884.

Now, Daniel, you have gone and let the cat out of the bag. And so Aunt Lucinda kissed Grandpa Langstroth right before all the people, did she? Well, I guess it didn't do any harm, after all. I am very glad indeed to see so friendly a feeling among the veterans. So you like to scare the girls, do you? Well, if you scare them with drones only, I guess it won't do very much harm. Look out that you don't get hold of a worker-bee, though, when you think you have only a drone.

LUCIAN'S STORY ABOUT HIS PA'S BEE-KEEPING.

My pa bought two swarms of bees in the winter of 1881. They died in the spring of 1882. Some bees found the empty hives, and came to go into them, and I threw some stones at them, and they alighted on a wheelbarrow, and I told ma the wheelbarrow was painted with bees, and she came out to see, and ran and called papa, and he hived them. That swarm increased to 3. We put them in Simplicity hives, with chaff cushions and chaff division-boards, and they wintered all right, and increased to 18. We bought one swarm of Italians, and Italianized 6 others. We found another in the fruit-yard, on an evergreen, and pa went to one of the neighbors and got two which they were going to take up, which made 22. They swarmed so often that they didn't make much honey—about 200 lbs., I guess, and pa thought they did not have been enough, so he went to the woods and got 6 swarms and put in with them, then he fed them as much sugar as he got honey, then left them all on their summer stands, and put 11 of them on boxes, and packed them in chaff. He built corn-shocks around the other 11. This week we overhauled them all; found one swarm queenless; another very weak. We put them together, which made a good swarm. The rest were all right, only they were a little short of stores, so we made some candy and fed them.

Pa bought the A B C book and a smoker of you, and GLEANINGS also; and of course I have to take care of them.

LUCIAN DARNELL, age 11.

Hinckley, Ill., March 21, 1884.

Our Homes.

Pray for them which despitefully use you and persecute you.—MATT. 5:44.

I WONDER how many there are among my readers who have been inclined to laugh and jeer when the subject of prayer came up. I once had a talk with a saloon-keeper in jail who expressed himself something like this: "Why, Mr. Root, it really makes me sick to hear folks talk about praying. I have heard so much about it that it disgusts me." And to tell the truth, dear friends, it is not very many years since I told my good old mother that such things as family prayer and family worship were behind the times, and only a relic of an old superstition. For many years family worship had been dropped in my father's household, but there had been a sort of neighborhood revival at the time, and father and mother had been discussing the matter of Bible-reading and prayer. Shall I tell you, friends, where I stood at the time I declared the Bible and prayer were behind the times? I was about eighteen years old, and of course thought myself capable of deciding on the most important matters then before the world. My Sundays were spent in going around and amusing myself wherever I felt inclined to go. Although I had got started in no very bad habits, I was averse to church-going, and preferred to spend my time with a class of men and boys who told low-lived and obscene stories, and rambled about the woods, and sometimes the saloons, where, in years after, the Abbeyville Sabbath-school was started. Not long afterward, my good father insisted on my going with the rest of the family to church, and he did a very wise, kind thing, I tell you.

I have taken up this subject of prayer just now, because I have been thinking there might be those among you, especially among the younger ones, who feel annoyed by prayer, and who also feel a backwardness about discussing prayer. "What good does it do to pray?" some one may ask. May be I can help you a little in it, friends; or perhaps I can suggest some place and times in which prayer is a really good thing. Jesus recommended prayer a good many times. He once told his disciples how to pray; and in the closing up of this great sermon of his on the mount, he advises us to pray for those who despitefully use us and persecute us. Why did he give us such advice as this? In the sentence just before this one, we read, "Do good to those which hate you." Now, it is a good plan to do good to anybody. One who goes through the world doing good will be happy; there is no happiness that we find in this world of ours equal to the happiness that comes from the sense of having done good to somebody. It is a pleasant thing to do good to friends—to return favors—to do them a kindness. But very few know of the rare thrill of joy that comes to a human soul when he has deliberately and purposely done a good act to some one who has been unkind and spiteful; especially if it has been done because of these words from our Savior. It

is a hard thing to do, I know; but blessings come in proportion to the sacrifice and difficulty we find in obeying the commands of our Savior. Before you can do good to an enemy, your thoughts and feelings must undergo a change to a certain extent. You have got to feel kindly toward him. You have got to overlook his unkindness toward you, and let it pass; and to do this you will have to cultivate a Godlike spirit. Now, the best step toward honest prayer for anybody is to think kindly of him; in fact, you can not pray with bitterness in your heart. Praying is the forerunner of doing good, and it is, therefore, in one sense, doing good. When you pray for some one, you have commenced to do that person good. You have called on God the Father, and invoked his divine blessing upon him. Ungodly men know what it is to curse people they do not like. Of course, they have little or no faith that God hears, or as little care. Still, they have called upon him. They called upon him in the wickedness of their hearts. One who loves God, and who is trying to be honest before him, never takes his holy name upon his lips, except it be with reverence and respect and honest sincerity; and so in calling upon God to make the one who misused us better. We have committed ourselves, as it were, to the work of reclaiming not only the brother who stands before us, of whom we have been thinking, but of reclaiming the world, and therefore we are in unison with God, and working with him. If there is any thing good in any human being, all his better qualities, and all that is good in him, is called out and called into its greatest and best activity by the mental effort he makes in going to God in prayer. The act of praying frees him, as it were, from earthly passions and selfish ends and motives.

I have told you many times of how prone I am to get prejudiced, or stirred up to lose, for the time, my calm and quiet better judgment. A great many times even now, as I lie down at night I feel sorry that I have been so vehement in some certain case during the day. I feel sorry I have not been more considerate in regard to the feelings of those around and near me. I often, very often, feel sad to think I have dwelt so much on what is wrong in my fellow-men, and have thought so little of the good part there is in almost every one. Prayer helps me over this besetting sin of mine, and one of the prayers I utter oftenest is for a gerater and broader love for humanity.

Once I had some difficulty with a very good friend of mine. We both argued the case, and each felt considerably tried with the other because we did not see the thing just alike. I felt badly that night as I knelt in prayer before retiring, and felt a little like apologizing for having been so vehement and ungentlemanly, for that is just what it was. My friend was a Christian and Christians should be very careful to remember that "we be brethren." I had, as I said, an uncomfortable sort of feeling that I had somehow overlooked the matter that we were both professed followers of Christ, but it did not strike me very forcibly until I came to my type-writer in the morning,

where I found a little note of apology from this friend, and an expression of sorrow that he had not been able to make his life more consistent in this very respect. The closing of this little note was in words something like this: "Please pray for me." Through many a year these words have followed me, and have given me fresh inspiration and energy in trying to follow the Savior. Do you see what a change, friends? Suppose you should disagree with some Christian brother or sister, and have a pretty warm talk. When we are having these warm talks, we feel like doing almost any thing else rather than pray for each other. Did you never think of it? The tendency is to wish our opponent to do almost any thing else, rather than pray for us. Satan persuades us that our friend is no Christian at all; that we are right and he is all bad, and therefore Satan's logic would be that you do not want your friend's prayers; because if he did pray, or try it, he would be a hypocrite. Well, now, to get where you can ask him to pray for you, you have got to un-bend quite a good deal yourself. You have got to consent to believe and admit that you are a sinner; and you must include in it that this brother with whom you have been having this tussle is a good man and a Christian; furthermore, that he is just as good as you are, and has just as much right to stick to his position as you have to yours. I wonder if it is as hard for anybody else as it is for me to come down and humble myself in this way, and give up. Well, after you have pounded down *self* (and it generally wants pounding down a good way too) you have got to love your opponent. Some way it is awful hard for me to do that too. Then when you two stand side by side,—even in spite of your differences so near side by side that you can truly and honestly say, "We be brethren,"—then, and not till then, can you ask him to pray for you. I wonder if we shall ever realize, friends, how much we need the prayers of others. "I am having a pretty tough time of it, Mr. Root. Please pray for me." These were the words of a friend who had commenced to give up tobacco. How gladly I prayed for him, and how glad I was that he spoke those words! It has warmed my heart toward him ever since, and it has made me happier to think that he in his weakness and helplessness cared for my prayers. Men of the world may laugh and sneer at prayer, because they insist that it is all put on. What an idea that is of Christianity or Christian people, that a man would put on a pretense of devotion in order to further some selfish end or scheme! What an awful sin is the sin of uncharitableness, or, rather, to what awful depths may it lead us! It has seemed to me lately, that it is a sin that might almost be set side by side with intemperance; and one of its worst features is, that it gets in everywhere. It gets into Christian homes. It is seen sticking out in its hideous unsightliness among otherwise well-bred people. It makes the whole world hideous, instead of full of beauty.

At our prayer-meeting last evening, our pastor mentioned a celebrated sculptor who, it was said, always saw angelic forms in

blocks of rough marble. He was looking for beauty, and his mind dwelt on that which is good and holy and pure. Now, scoffers and cynics see no beauty; they see nothing angelic. It is our privilege, friends, to look at humanity as this sculptor looked at this block of marble; not only our privilege, but duty. In one of "Pansy's" writings, which I have been reading within a few days, she takes off this prevailing and besetting sin, and I want to copy the narrative a little, just to give you a view of it. Our readers are to bear in mind, the following sketch is a conversation that took place while the family, who had just returned from church, were waiting for the father to come in to prayers. Helen and Ermina were church-members, while Tom and Maria were not:

Mr. Randolph had gone to his room, would be ready in a little while, Grace said, so the family lounged in various attitudes awaiting his coming.

"What a *very* long sermon Mr. Gordon had to-night!" Helen said, folding her erape veil. "I got so tired, I wonder if it wasn't an old sermon. Some way it sounded like one to me."

"I'm sure I don't know. He might preach an old sermon every month, and I should be none the wiser. I can't remember Mr. Gordon's sermons; they don't interest me." This from Ermina.

"I think this one was interesting; there were a good many illustrations." This was Grace's timid protest.

"I'm tired of his illustrations," Helen said, wearily. "He has about twenty for every sermon. I don't see the use of a minister telling stories all the while, as if his congregation were a parcel of children."

"Nevertheless it is generally considered the most acceptable style of sermonizing," Tom said, as he stretched his handsome self on the lounge, and laid his curly head on Grace's lap.

Helen turned, and looked at him in cool surprise.

"Who ever imagined that you had any idea concerning the most acceptable style of sermonizing? I didn't know it was in your line."

"It has been in my line to hear Beecher and Talmage and John Hall, perhaps you know; and I heard several illustrations used, I can assure you."

"Oh, well, I have no objection to illustrations where they are needed to explain truth to those who can not understand it without. I only wish you had profited by those you have heard."

"I wish I had, with all my heart," Tom said, gloomily. "I think, myself, that *patterns* are needed as well as illustrations."

Maria here took up the conversation.

"I wish Mr. Gordon would leave his handkerchief at home; how nervous that man does make me, winding it around his hand and twisting it in all sorts of shapes. I'm always afraid he will forget where he is, and make an out-and-out rabbit, as I presume he does at home for the children."

"His handkerchief doesn't trouble me as much as his continual fidgeting," Ermina said. "Squeaking boots too. If I were Mrs. Gordon I'd soak them in grease for a month; and he shrugs his shoulders worse than ever. Helen, did you notice him to-night? It's for all the world just as his baby does, when it wants something it can't have."

"He is so wretchedly nervous, anyway, that it is a trial to watch him. Sis Wilcox says he gives her the fidgets."

"She has them, anyway," Maria said. "She acts like a simpleton. If I were going to whisper and laugh as much as she does, I should choose some less conspicuous place than the choir."

"Well," Ermina said, "she is a simpleton; why shouldn't she act like one?"

"She is a member of the same church with yourself," Tom said, pointedly; and Helen made emphatic response,—

"What if she is? That doesn't insure perfection."
"So I perceive. I was simply interested in observing how you all love each other."

"I wonder who pretends to love her? I'm sure I never did."

"But I thought that was one of the articles of your creed?"

"That only helps to show how limited your knowledge of church matters is. Maria, how many colors had Laura Fox about her this evening?"

The point I wished to call attention to, friends, was particularly the uncharitable criticism of the family circle. Not only was the minister pulled to pieces and found fault with in a way that is really painful, but their own particular friends who attended church came in for their share; and before they got through they turned around and said bitter and spiteful things to each other. The two who were church-members seemed just as bad, and may be a little worse, than the others. You may say that this is fiction. Friends, it is not *all* fiction. There is a tendency to just such talk in our own family, and I am ashamed to say it; and for some strange and unaccountable reason it seems as if the temptation were greater after coming from the house of God than at any other time. I know it from personal observation, and from what I have heard, that these sins are common ones. When I first heard that grand, wonderful sermon after I had chosen Christ as my leader, a lady made the remark, as she was passing along the walk, just after she got out of church.—

"Seems to me Mr. R. didn't preach to-day as well as usual."

I almost started in surprise and astonishment. To me, the sermon had been the most wonderful I had ever heard. Nay, that expression does not half tell it. To me, it was *the* most wonderful event of my life. As I drank in his words, and realized that it was my privilege to stand by him and work with him, the flow of happiness that poured in upon my soul was beyond any thing life had ever given me; and yet this other listener spoke of it as something extremely mild and commonplace, and not even up to his average! Dear friends, do you not see that it is in the listener, and not in the preacher? I came just on that Sunday, hungering and thirsting for righteousness, and for the word of God, and I was filled—filled in very truth, till I overflowed with love and charity to all mankind. Poor Tom! he saw the jarring discord; and although his reproof was not given with a Christian spirit, it was none the less true. Although he was no professor, he knew that Christ had said, "By this shall ye be known of all men, that ye love one another." And when one of his sisters remarked that their friend Miss W. talked like a simpleton, and

that the other took it up by saying, "She is a simpleton; why should she not act like one?" he could not help replying that he was interested in observing how they all "loved each other." Poor Tom was unhappy because his own conscience was troubling him. He was disgusted, too, to see how very little trace of the spirit of Christ could be found in professing Christians, and these his own sisters. May God help us! I hardly need tell you that this family, and especially these daughters who were church-members, should have gone to church praying for their minister, and hungering and thirsting for the salvation of souls. If the friend of whom they spoke was really fidgety and nervous, why, of course she, poor girl, should have been prayed for too. Tom was not given to prayer; but yet, poor fellow, he seemed to know what was wanted and what was needed. Jesus said, "Pray for them which despitefully use you and persecute you." We who are his professed followers forget not only to pray for enemies, but, I am afraid, instead of praying for friends, we indulge in fault-finding and criticism. "Lord, help! Help us all in our fearful lack and want of that divine spirit that would lead us to peace and happiness and all that is good." How often I need that prayer, friends! If we ever offered prayer for those about us; if we truly loved humanity, how could we have the disposition to see things as we do?

While we are on this subject, dear friends, may I ask you if you are praying for your pastor? or is it true, that you look for imperfections in him as well as the rest of the world, and indulge in rehearsing his faults and failings and weaknesses? God help you to correct it if you do. If we are to pray for friends and enemies too, then we are to pray for everybody; and if we can not pray consistently without love in our hearts, then we are to love everybody. "Thou shalt love the Lord thy God," you know the command is, and it also includes "Thy neighbor as thyself." What a wonderful thing it would be, to be able to go through life with this spirit of love and prayer for everybody! for do you not see how it would crowd out and preclude all this uncharitableness and fault-finding feelings and speeches?

Sometimes when disposed to find fault, and to pick at people's weaknesses and imperfections and shortcomings, I have mentally stood still, as it were, and taken a view of the promptings of the evil one, and then turned and taken a view of what the promptings of the Savior would be. Satan would prompt me to say, "Why, that man is a fool; he does not know any thing at all. Did you ever see or hear of so ridiculous an operation as that?"

About the time he has got so far as that, I stop him; and then, like the sculptor who saw an angel in a simple block of marble, I try to turn right square about and think of the good qualities of this same brother. The very thought of calling him brother, and recognizing him as a fellow-traveler, does me good to commence with. Then I try to put it this way: We all have our different ways of doing things. I have my notions of

how work should be done, and other people have theirs. But although their way is widely different from my own, it does not necessarily follow that mine is so much the better. Perhaps when he gets through he will have accomplished as much, or more, than I would have done. If he is really lacking in ability, what a very unkind and unchristian act it would be to call him a fool! If it were really a fact that he is dull, and I am bright and ready, the proper thing for me to do would be to feel a brotherly sorrow for his mistakes, and an earnest desire to give him a little lift, out of gratitude to God for having given me abilities beyond his own. I am supposing, you see, that my abilities are superior to his. The fact is, this is probably only one of Satan's wicked suggestions. What a very poor way it is, anyhow, to get into a habit of calling folks fools! or, to put it into the language of the little story we have been giving an extract from, to call folks "simpletons," or to even say they *act* like simpletons. If somebody should want to know of me the best way in the world to be unhappy and blue and miserable, I think I should tell him to commence by finding fault with his neighbors; call them fools and simpletons; and if you do not get the blues pretty soon afterward, it will be very strange indeed. In the same line, I should advise one who wanted a recipe for making one happy, to speak good and think good of everybody he comes across. Or, to come right down to the science of the matter, pray for people you have any thing to do with; and especially pray for them when Satan persuades you to feel unkindly toward them. This matter of praying for people is not simply words, mind you. The repeating forms of prayer because somebody told you to, will no more bring the blessing than will talking about the garden, get it free from weeds, and make the plants flourish. You must get right down to the business. Sometimes people urge that they can not feel a love and interest in others. My friends, you can do kind acts for others, and you can speak gently to them, and you can stop wicked thoughts about them, just as surely as you can go out into a garden and kill weeds, and loosen the dirt about the plants you love.

In our Tobacco Column, quite a number have said of late, "Pray for me." I am always glad to hear this, because I know it indicates spiritual growth. It does us good to ask our friends to pray for us, in the same way that it does to pray for them. One who stands up in prayer-meeting, and says, "Pray for me, friends," must be an arrant hypocrite indeed, if he could, after this, indulge in spiteful thoughts or speeches toward those of whom he had asked to be remembered in their prayers. When I have asked some friends to pray for me, I am afraid I shall do something inconsistent with this request. I am afraid I shall dishonor the name of Him who taught us to pray.

One day, not a great while ago, I had been talking about this same matter of prayer, and I was so afraid I should say something afterward, or do something inconsistent with what I had said, that I actually meditated

having some little cards stuck up around through the rooms of the factory, and I would have printed on them, "Look Out!" Then, when my eye caught them, I might remember that I was to look out and do nothing out of keeping with what I had said. Thus you see, friends, how prayer is a safeguard. It is a contract, or compact, as it were, between ourselves and God the Father. In the 17th chapter of John we have a record of the way in which the Savior prayed. Here is what he says about this compact that should bind us to him and to each other:

Holy Father, keep through thine own name those whom thou hast given me, that they may be one, as we are.

And again:

As thou, Father, art in me, and I in thee, that they also may be one in us: that the world may believe that thou hast sent me.

Through prayer we get acquainted with God, as it were. This communion with him opens out and enlarges and expands like any thing else we study in nature, or, rather, beyond any thing else; and after we have made progress in this direction we seem to live and move in a different world, so to speak. Others, may be, who have no faith in God and prayer, may laugh and scoff at us. But it does not harm us one bit. We know we are safe, because we are at home. The sense of security and safety that comes to an honest follower of the Savior's teachings is more sure and satisfying than any thing else in this world. See these concluding words of that wonderful prayer, and the promise that is carried with it:

O righteous Father, the world hath not known thee: but I have known thee, and these have known that thou hast sent me. And I have declared unto them thy name, and will declare it: that the love wherewith thou hast loved me may be in them, and I in them.

Tobacco Column.

WHAT A GOOD SERMON DID.

I AM a member of no church, but I believe the Bible, every word of it. We have got as good a pastor here in our church as I ever heard preach. Some ten months ago he gave the young men a sermon, and it was about this one thing. He told them to go home and pray to the Lord Jesus Christ to help them. So I did as he said, and there has not been a night in ten months but that I have prayed, and God has heard my prayers, for I prayed that he would take that appetite for tobacco from me, and he has, for I have not wanted it since; and before that I used almost \$3.00 worth per month. I spent over \$200.00 for smoking and chewing. Now suppose I had taken that and bought some good books, or given it to my neighbors to buy GLEANINGS with. How much better it would have been for my fellow-men and me! Now I say, young men and old men, put your trust in the Lord Jesus Christ; pray to him, so when you go to town on Saturday, and election day, you will come home to your mothers, to your wives, and to your sisters, good, sober men as you went. I believe in Christ, and he will answer prayer.

A. H. TISDALE.

Minneapolis, Minn., March 18, 1884.

Friend T., you say you are a member of no church. Why not go to the kind pastor who preached that sermon, and tell him what you have told us here, and then stand up before men, and enroll yourself under the banner of the cross? I am afraid it is a dangerous thing to stand long where you are. How often we hear of men who came out in meeting, and resolved to live a Christian life! The world looks on, and wonders whether they will hold out or not. I do not know that we can blame the world, for the world has seen many start; but, alas! by far too many did nothing more than start. The question is often asked, a few weeks afterward, "Did he go right ahead and unite with Christian people, and keep on?" So you see, even the world seems to know what the proper thing to do is. If you believe the Bible, if your trust is in your Savior, why stand still? If you love God, you are in duty bound to love your fellow-men also; and if you love them, why stand off at arm's length, or further, and hold aloof from them? For a good many years I have noted how this thing goes; and as the years pass on I am beginning to feel that a Christian, alone by himself, is almost as unsafe as a single bee would be, if he proposed to camp out, and not unite his fortunes with the rest of the hive. Come in, dear brother; help us, and let us help you, before Satan gets hold of you again, and you are lost for ever.

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE
OF READING MATTER.

MEDINA, APR. 15, 1884.

Behold how good and how pleasant it is for brethren to dwell together in unity.—PSALM 133:1.

DRONE TRAPS.

FRIEND ALLEY informs us that he did not see friend Black's description of his drone-trap, given in our Sept. No. for 1883. He also says that drone-traps were patented as long as 30 years ago.

BASSWOOD TREES FOR PLANTING.

We take pleasure in saying that we have received a sample hundred of the basswood-trees sent out by friend H. Worth, of Borodino, Onondaga Co., N. Y. The trees are very much larger than we expected at so low a price; are strong and thrifty, and are well packed for shipment.

MRS. COTTON.

COMPLAINTS are coming thick and fast in regard to Mrs. Cotton, but mostly because of the great price she charges for such meager directions for making the kind of hive she recommends. I am sure, dear friends, no honest, healthy business can ever be built up by taking so large a sum of money for so small an amount of information.

WHAT IS YOUR NAME, AND WHERE DO YOU LIVE?

I AM afraid I shall have to say to the juveniles, that unless they give the full address on their letters, we can't send them a book. "Ida" says, that of late she is obliged to hunt over the envelopes, and go to the postal guides, to see where the books should go. Now, ought any little friend to have a book who can not take the trouble to tell plainly where we are to send it, county and all?

UNTESTED QUEENS.

UNTIL further orders we will pay one dollar each for untested queens. This price will not probably hold good after May 1, although demand and supply will have something to do with it. These queens will be introduced into our own apiary, and we expect them to be raised from imported Italian mothers, or from select pure Italians. If you do not send us good ones, we shall probably not want any more from you.

UNTESTED VS. TESTED QUEENS.

A GREAT many are wanting to sell us tested queens just now; but to tell the truth, I would rather have an untested queen from a reliable breeder, than a tested one. Do you want to know why? Tested queens are, all of them, last season's rearing. Untested queens are this spring's raising, and have all their lives before them. Therefore I would rather run the risk of their being pure, than to have a tested queen after at least a third of her life has been spent. I believe the friends generally feel as I do about it, or else they wouldn't pour in their orders for untested while so very few want tested queens. It is a little singular, the way this thing has swung around, in spite of all the arguing we have done on the subject.

FILLING ORDERS PROMPTLY.

AT this date, April 15, we are prepared to fill orders promptly for almost every thing except sections. Even with a large new dry-house, embracing all the latest improvements, we are unable to get our basswood dried as it should be, to keep up with the demand for sections. The best we can do is to fill each order in its turn; and in making an order, please say whether we shall send your other goods right along, or have them wait for the sections. As we are unable to supply the demand for the regular Simplicity sections, we can not undertake to make odd sizes until we catch up. Now, if you prefer to have your money returned, rather than wait your turn on sections, just drop us a postal, and it will go right back at once. At the rate we are now turning out sections, we hope to catch up with orders in three or four weeks. Of course, we can not tell how fast they may come in.

CHRISTIANITY AND TOBACCO.

THE little book on tobacco, entitled "A Dose of Truth," of which we gave a favorable mention a short time ago, we are now enabled to offer for sale. Price 20 cents, or \$1.75 for 10, or \$15 per 100. If wanted by mail, 3 cents each extra. Friend Bracken, the author, has placed a number of these books at my disposal, to be given away to every one who breaks off using tobacco. Or it will be sent by mail post-paid to any store-keeper who stops selling tobacco. In fact, a great part of the book is written to Christian people who deal in tobacco and cigars. Whoever gets a book for giving up tobacco will probably

lend it to his friends, and the great array of facts therein given can not fail to convince any candid reasoner that the use and sale of tobacco is a terrible sin in a Christian land, and among Christian people.

THE FLOOD IN LOUISIANA.

FRIEND VIALLON wishes us to give place to the following, that his customers may not blame him undeservedly:

On account of the N. O. & Texas Pacific R. R. and the Morgan, Louisiana & Texas R. R. being under water since 30 or 40 days; it has been with the greatest difficulty that I have been able to get Texas freight off; and as it will probably be as long before these roads are in running order, I would advise my Texas customers not to send me any orders, if they don't wish to be delayed.

P. L. VIALLON.

Bayou Goula, La., April 8, 1884.

A CUSTOMER has sent us a copy of Mrs. Cotton's drawings and specifications, asking us to give figures on such a hive. These drawings probably cost him \$3.00 (and one dollar more for the book); but Mr. Gray and I have both examined them, and it would be toward a week's work for a good mechanic to figure out and make such a hive, if he could do it at all from these brief drawings. The whole 7 pages contain only 72 lines of printed matter, by way of explanations. The drawings, book and all, do not begin to give the information in regard to making beehives that is ordinarily found in almost any text-book on bee culture. The hive is an exceedingly complicated affair, with old-fashioned glass honey-boxes (with holes bored in the bottom) in place of the modern sections so generally now in use. Mrs. Cotton's revenue, probably a greater part of it, consists in getting the four dollars for these drawings and her little book. I have written to her privately, remonstrating, and I put this in as a public remonstrance against giving or taking such a sum of money for such meager instruction.

CIRCULARS RECEIVED.

J. F. Hixon, Lock 53, Md., sends out a one-page circular of queens.

Wm. Little, Marissa, Ill., sends an 8-page circular of bees, and hives.

H. Hancock, Siloam Springs, Ark., sends out a one-page circular of queens.

E. F. Carroll, Dresden, Texas, sends out a 4-page circular of bees and queens.

G. Rouse, Wahoo, Neb., sends out a 2-page circular, principally in regard to L. hives.

J. I. Parent, Charlton, N. Y., sends us a 2-page price list of bees, Idm., and other implements.

E. H. Chamberlin, Dexter, Iowa, sends out a 6-page circular, principally in regard to the given foundation.

J. M. Hambaugh, Versailles, Ill., sends out a 4-page circular. His specialty is Simplicity-Longstroth bee-hives.

G. Knickerbocker, Fine Plains, N. Y., sends us an 8-page circular pertaining to bees and general supplies for the apiary.

G. W. Stanley & Bro. send out a circular pertaining to the automatic honey extractor, described in this number. Prices \$15.00 and \$20.00.

J. T. Fletcher, West Monterey, Pa., sends out a 24-page circular, mostly devoted to poultry, although the last four pages treat of bees, queens, and hives.

C. Graham Ashland, Williamson, Wayne Co., N. Y., sends out a circular of queens and Simplicity bee-hives. Friend A. has a branch apiary in Florida.

T. S. Hall, Kirby's Creek, Ala., sends out a 24-page price list and circular of bees, queens, hives, etc. Friend Hall has furnished us with early queens for several years.

We have just printed for D. E. Best, of Best's Lehigh Co., Pa., a 12-page list of apiarian implements and supplies, bees, queens, and general implements, etc. From the unsifted business talks, we judge he is showing the inhabitants of that section something new in regard to apiculture. Send for one of these circulars.

We are with much pleasure that we notice that our old friend J. H. Nellis has again resumed the supply business. He sends out a very neat circular, dated March, 1884; and although he does not say so, we presume he is prepared to make every thing straight and pleasant in regard to the unsettled business when he dropped bees and supplies a year or two ago.

Now, friends, there are many things which can be had to much better advantage near home than by sending off long distances. So far as we know, the above-mentioned friends are reliable, and I think it would be advisable to get your bees and queens from some place near home, so far as you can. If you do not go far away, it would perhaps pay for many of you to visit these friends who publish circulars, and are prepared to furnish information as well as bees, hives, and implements.

CONVENTION NOTICES.

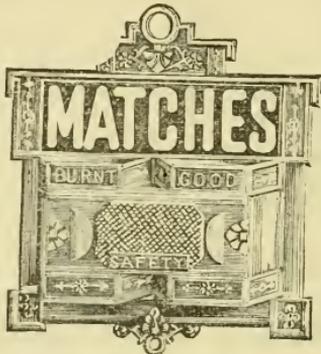

The fourth annual meeting of the Western Beekeepers' Association will be held in Independence, Mo., Thursday and Friday, April 24 and 25, 1884.
C. M. CRANDALL, Secretary.

A meeting of all persons interested in organizing a bee-keepers' association will be held at Randolph, Cattaraugus county, N. Y., Tuesday, May 6, 1884. The territory will embrace Western New York and Northwestern Pennsylvania, and it is expected a large number of bee-keepers will be present.

W. A. SHEWMAN.

THE NEW

LUMINOUS MATCH-SAFE.

The above little implement has been sold for 25 cents; but by purchasing a lot of ten gross, directly from the manufacturers, I am enabled now to put them at only 15 cents; and in lots of 10, \$1.20; 100, \$10. If wanted by mail, 4 cents extra for postage. The word *matches* shows in the day time in large plain white letters, on a bronze background. In the night these letters shine with a pale purplish light, plainly to be discerned in any part of the room. The match-holder is a beautiful ornament by daylight, and more beautiful in the darkness of the night. There are two apartments—one for good and one for burnt matches. There is also a place for scratching the matches; and where safety matches are used, as in factories and other similar places, a couple of clasps hold the proper material conveniently near for igniting them. This little match-safe is beautiful as an ornament for your homes, pretty for a present, and very convenient for strangers going into a strange room in the dark; or if you choose, for strangers who wake up in a strange room in the dark, and want a light quickly.

A. I. ROOT, Medina, Ohio.

BEST SUPPLEMENT FOR 1884.

Watch free to everybody who will send me an order for ½ dozen tested, or 1 dozen untested queens. The world-renowned Waterbury watch and one queen, only \$4.00. Watch alone, \$3.50 by mail. I think I now have the very best strain of bees that have ever been offered at so low a price. It is just the bee that attracts everybody's eye; viz., for beauty, pleasure in working, and large yields of honey. Everybody wants them. Italian tested queen, in April, \$4 to \$6; May, \$3 to \$4; June, \$2.50 to \$3.50; July and after, \$2 to \$3. Untested, in April, \$2; May, \$1.50; June, \$1.25; July and after, \$1. Albinos and Holy-Land queens, my favorites, one-fourth more than Italians.

Dealer in scales, comb foundation, Simpson honey-plant seeds, or roots; 70-cent smokers, canary birds, brown Lghorn eggs, \$1 per lb, and U. S. honey-extractors. Wax wanted. Send for circular.
8d D. E. BEST, Best's, Lehigh Co., Pa.

EMPTY COMBS.

I have about 500 empty combs in L. frames which will sell cheap; also a lot of 4¼x4¼ sections with combs drawn out; empty sections, frames, Simplicity and L. hives, extractor, etc. All at very low prices. Address

STANLEY'S AUTOMATIC HONEY-EXTRACTOR

REVERSES THE COMBS BY REVERSING THE MOTION OF THE CRANK.

THE COMB-BASKETS ALWAYS STOP IN MOST CONVENIENT POSITION FOR PUTTING IN OR REMOVING COMBS.

Each Extractor has a Long strong Crank, so that the Machine is Easily Operated, and a Brake to stop the Motion is so Arranged that it Can be Managed with the Left Hand.

They have best Vertical Gear, with Two Bearings for Crank-Shaft.

All cans are made from XXXX tin; or if desired, we will make them from heavy galvanized iron at same price.

The cylinder of can is all in one piece. We make all our Extractors to take 2 or 4 combs, and they can be changed from one to the other in one minute. We make the Automatic to hold any size of frame. We challenge any extractor now before the public to do one-half the work of our 4-frame machine. Do not pay out money for inferior machines, but write us for terms, as our prices are reasonable.

We want a good live agent in every bee-keeping locality, and especially in Cuba or San Domingo, to whom we will pay a liberal commission. If you have not already received our circular giving full description, send your name on a postal at once to

G. W. STANLEY & BRO.,
WYOMING, NEW YORK.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable. Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with *, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

Black and Hybrid Queens For Sale.

For the benefit of friends who have black or hybrid queens which they want to dispose of, we will insert notices free of charge, as below. We do this because there is hardly value enough to these queens to pay for buying them up and keeping them in stock; and yet I often times quite an accommodation to those who can not afford higher-priced ones.

I have 8 black and 15 hybrid queens to sell; will take catalogue prices. HENRY WRIGHT, Selma, Dallas Co., Ala.

I can supply black or hybrid queens, about 50, at A. I. Root's prices. Dr. J. A. GUNN. Caskey, Christian Co., Ky.

I have two black queens for sale at the usual price. Safe arrival guaranteed. W. J. CROWLEY, Roanoke, Denton Co., Texas.

I have 20 colonies to Italianize. Would like to sell 20 black queens. Will sell only the best. Ready now. Price 40 cents. J. P. CONNELL, Hanover, Hill Co., Texas.

I have 15 or 20 black queens for sale in May for 40 cents each, and 20 hybrids for 60 cents each. GEO. F. TYLER, Honey Grove, Fannin Co., Texas.

One dozen brown or German queens for sale. Those ordering immediately can have them for 40c each, or three for \$1.00. GEO. P. KIME, Evansburgh, Coshocton, Co., Ohio.

I have a lot of good laying hybrid Italian queens, ready to send by mail now, for 75c each. Safe arrival guaranteed. Send cash and address. J. W. WINDER, Thibodaux, Fourche Par., La.

FOR SALE!

Eleven Hundred Pounds of Beeswax.

J. C. CONVERSE, Ravenna, Portage Co., Ohio.

Italian Bees and Queens!

Full colonies in one-story Simplicity hive, standard L. frame (as made by A. I. Root), in May, \$10; June, \$8 00; July and after, \$7.00. Hybrids, \$1.00 less. Three-frame nuclei, L. frame, May, \$4.50; June, \$3.50; July, \$3.00.

Dollar queens, June and July, \$1.00; after, three for \$2.00. All queens from imported stock.

Bee-veils, best kind, 50c postpaid. Satisfaction guaranteed. D. S. BASSETT, Farnumville, Worcester Co., Mass. 8-9d.

Hive Manufacturers.

Who agree to make such hives, and at the prices named, as those described on our circular.

- A. I. Root, Medina, Ohio.
- P. L. Viallon, Bayou Goula, Iberville Par., La. 7fd
- M. S. West, Flint, Genesee Co., Mich. 1-24
- Apiarian Supply Co., Wilton Junction, Mus. Co., Ia. 3-1
- J. W. Newlove, Columbus, Franklin Co., O. 7
- C. P. Bish, Petrolia, Butler Co., Pa. 9-17

Given Comb Foundation a Specialty.

Also apiarian supplies, circulars, and samples free. 9-11d G. H. KNICKERBOCKER, Pine Plains, N. Y.

1884. 6 Warranted Queens for \$5.00. 1884. Write for circular. J. T. WILSON, MORTONSVILLE, KY.

Dadant's Foundation Factory, wholesale and retail. See advertisement in another column. 3b7fd

GREETING!

To my many old customers and the public: I am glad to announce that I am again to the front in the manufacture and sale of all desirable kinds of comb foundation. Wholesale and retail prices on application. J. H. NELLIS, Canajoharie, N. Y. 9d

BEE-KEEPERS, I will sell COMB FOUNDATION at 50c per lb., for brood, and 55c for light. All made of refined wax. Send for samples. Supplies of all kinds kept on hand. A. F. STAUFFER, Sterling, Whiteside Co., Ill, 9

Vol. XII.

MAY 1, 1884.

No. 9.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 COPIES FOR \$1.90; 3 FOR \$2.75; 5 FOR \$4.00; 10 OR MORE, 75 CTS. EACH. SINGLE NUMBER, 5 CTS. ADDITIONS TO CLUBS MAY BE MADE AT CLUB RATES. ABOVE ARE ALL TO BE SENT TO ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canada. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

NO. 54.

SELLING HONEY.

THE one who teaches bee-keepers how to sell their honey at remunerative prices, performs fully as important a service as he who teaches them how to secure large crops. I know that the subject has been worn threadbare; but I do think that bee-keepers neglect that best of markets, the home market; or, if they do attempt its development, they go at it in a "half-hearted" manner. After having induced some grocer to buy their honey, or to sell it on commission, many bee-keepers seem to think that their responsibility is at an end; if they have effected a sale, their thoughts are apt to flow something like this:

"There! that is off my hands, and I have my pay for it; I don't know what success he will have in selling it, but that is his lookout, not mine."

Never was there made a greater mistake. Business transactions are seldom long continued between two parties, unless there is satisfaction at both ends; and I tell you that these grocers who have never handled much honey need some looking after, or there will be some dissatisfaction. Let me illustrate. I once left four dozen pint and quart pails of honey with a grocer, to be sold on commission. The pails were bright and shining, and the labels neat and clean. When I called, two weeks later, about one-third of the honey had been sold, and every thing appeared to be passing off satisfactorily. A month passed, and I called again. Not seeing the honey, I said:

"Why, is that honey all sold?"

"No," was the reply; "it doesn't seem to sell so well as it did."

Just then my eye caught sight of it; the pails were stacked up on the floor, at one end of the counter. Each time when the floor had been sprinkled, preparatory to sweeping, a few drops of water had been accidentally thrown upon the pails, the dust had been allowed to accumulate upon them, and I didn't wonder that "honey didn't sell as well as it did."

Now, had I "spoken my mind," I should have said, "My dear sir, have you kept grocery as long as you have, and not yet learned that goods must be kept neat, clean, and attractive if you expect to sell? Or is it because the goods are not yours that you treat them as you do?" But I have learned that it is best not to find fault in such cases, so I simply said:

"These labels are becoming soiled; when I come again, I think I had better bring some new ones, and re-label them."

He looked at the pails musingly, and finally said: "They do look a little soiled, that's so; we were crowded for room, and I didn't know where else to put them."

The next week I called with the new labels, and asked for a damp cloth with which to clean off the dust, and a clerk was directed to get a dish of water and a cloth, and to help me. While the clerk washed up the pails, and I stuck on the new labels, we had quite a chat; and I improved the opportunity by giving him the best instructions that I could in regard to the care and sale of honey. When the work was finished, and the pails neatly arranged on a shelf near the door, the proprietor came forward and said:

"Well, they do look better, that is a fact, and we will try to keep them up off the floor after this. We are going to have some more shelves put up in a few days, and then we can put them up again where customers can see them."

Now was an opportunity to say something, and I improved it. There isn't room to tell one-quarter what I said, but I commenced something like this:

"Yes, that's the point; honey is not a staple; people don't come here regularly to buy it, as they do sugar, tea, coffee, tobacco, flour, etc. They seldom buy honey until they see it, hence it should be kept in sight."

Need I say that the next time I called, "honey had taken a new start"?

It requires considerable tact, as well as patience and perseverance, to educate some of these grocerymen. It will not answer to talk to them as though they knew nothing, while you know every thing. They should be treated with respect; but tact should be exercised, and no opportunity of "educating" them should be allowed to slip by unimproved. Take pains to convince them that you are telling them the truth, and thus furnish them with arguments with which to meet the objections and questions of customers.

Another point requires attention, and that is, honey should be put up in such shape that it will give the dealer no annoyance or trouble. Nothing will turn a grocerman against the business quicker than will dauby, sticky, leaky packages, or to be obliged to dip out extracted honey into the pails and pitchers of customers. Every retailer of comb honey should be furnished with a case having at least one glass side, and a door or cover that will shut close enough to exclude dust and insects. The Sturwold case is an excellent idea. Extracted honey should always be put up in the packages in which it is to be sold. In fact, every thing should be so arranged that the dealer has simply to hand out a package of honey, and drop the "change" into the money-drawer.

Please allow me to give another illustration. Having occasion, the past winter, to visit a town in which I had never sold any honey, I put a dozen and a half pint and quart pails of candied buckwheat honey into a valise, and took it with me. Upon my arrival I entered the principal store, and inquired for the proprietor. To my question, if I could be allowed to show him some honey, he asked if it was comb honey. Upon being told that it was extracted, he gave a short "No, I don't want any more of that nuisance in the store," turned upon his heel, and left me. Had I taken the offense, and left the store, that would have ended the matter; but I quietly waited for his indignation to subside, after which he came around where I was sitting by the stove, and said:

"I'll tell you, my dear sir, why I spoke as I did. About two years ago last fall we bought a large tin can of extracted honey. There was a molasses gate at the bottom to draw off the honey. At first all went pretty well, and we thought we had a clear thing; but the honey soon began to candy, and wouldn't run, and we had to dip it out like hasty pudding, and then shovel it out like lard. After a while we melted it up; but, not having things arranged for that business, it was quite a task; and when it candied again we melted it up and run it into jugs and pitchers and goblets and I don't know what all. I have a jugful up at the house now, We

have sold some of the pitchers and glasses filled with honey, but it doesn't seem to 'take' very well, and we have quite a lot of it yet on hand." Here he brought me a goblet filled with candied honey, having a circular piece of writing paper laid upon the surface of the honey, and thickly covered with dust.

"I tell you, I have had more trouble and bother with that honey than it was worth; yes, twice over."

Having thus "freed his mind," he gave me a look that plainly said, "There, now, what can you say to that?" I said, "My honey is in such shape that, even if you should not sell it, it will cause you no trouble; but, after the experience that you have had, it would be folly in me to ask you to buy it; but if you can spare the time, I wish that you would look at it."

Oh, yes! if it would please me, he would look at it. When he saw what shape it was in, how it was put up, read the labels, and listened to my "story," it was plain to be seen that he was pleased. The clerks gathered around and expressed their ideas. They didn't know whether it would sell in that shape or not; it seemed as though it might; but if it didn't, it would give them no trouble, etc. Well, to cut the story short, permission was finally given to leave the honey to be sold on commission, which I did, leaving an invoice bill. In a week I wrote the firm as follows: "I am coming your way next week; shall I bring you any more honey?"

They replied, "Honey is all sold. Bring about as much as you brought before."

When I called again, the proprietor was in a mood to talk; but it was in a different "strain." He had never been so surprised as he was to see how that honey sold; it seemed to "take" right off, and gave them no trouble whatever. We had a long chat, and I gave him the best advice that I could in regard to selling honey. In a few days I called again at the store, when one of the clerks said:

"Did you bring us some more honey to-day, Mr. Hutchinson?"

"No, sir."

"Well," he replied, "that last that you brought is all gone."

I went home with an order for nearly all the honey that I had.

Of nearly every store in which my honey has found sale, I could tell a "story," but the two that I have given will serve to "point a moral."

PROPOLIS AND SECTIONS.

I can only repeat what I said in my former article, that all parts of my hives and fixtures, when they are smooth, and touch nothing, remain free from propolis, "varnish," or "bee-glue." We never have to scrape the top or bottom bars of our sections, for they are always clean. Had I known, last season, when Ernest was here, that this subject was going to be discussed, I should have called his attention to the matter, and shown him that, except where two surfaces met, every thing smooth remained entirely free from propolis. You also speak of putting sections upon the table after the bees have traveled over the woodwork, and varnished it. I was not aware that the woodwork was placed upon the table. Yes, with the Heddon case we can use only individual separators; but has it not been repeatedly proved, that we can dispense with separators? I use no separators, yet my honey was shipped by freight to the State fair at Detroit, received the first premiums in competition with separated honey, was shipped home by freight, then carried 12 miles

in a lumber wagon to our county fair, where it found a purchaser. Not a comb was broken. You think the Heddon honey-board too much machinery. Is it any more machinery than the perforated zinc honey-boards, or than separators? It is placed in position at the opening of the honey-harvest, and is not usually again disturbed until the season is over, while wide frames containing two tiers of sections, or side storing, require almost constant manipulation. You say, after we once decide upon the proper width for sections, you can see no great advantage in having different widths. True; but have we *yet* decided upon the proper width? The majority of sections in use are probably nearly two inches wide; but there now seems to be quite a disposition to use narrower sections, and to dispense with separators. With the Heddon case this is an easy matter; but with wide frames they (the frames) must be cut down, or else new ones made, and then, if the charge is not satisfactory, and another change is desired, these frames must be thrown away or remodeled. You say that, with the combined crate, you can have any width by replacing the bottom-bars with such a width as is desirable. With the Heddon case there is no such annoyance. Last season I used sections 1 11-16 inches in width; and this season I shall change to 1 1/2; but it necessitates no change in my fixtures.

W. Z. HUTCHINSON.

Rogersville, Mich., April 2, 1884.

Friend H., I did not know that it had been repeatedly proven that we can dispense with separators. Judging from the tons of tin we are constantly cutting up into separators, and much of it for old honey-producers, I should say that it was proven that there are many men of many minds on this as well as other questions, although I should be very glad indeed to have it demonstrated that we can dispense with separators. Very likely Heddon's honey-board is no more machinery than the perforated zinc honey-board; but it is a great deal thicker, and therefore pushes the sections so much further from the brood-nest. It seems to me I should prefer to have the sections as close to the brood-nest as possible. The L. hive has taken the place of all other hives, principally because of this very feature, if I am correct. Now, when we use an L. frame to get our surplus boxes close to the brood-frame, why should we put in a wooden honey-board and two bee-spaces besides, to push the boxes away off again? I once started to make a hive expressly arranged so as to have the sections lie right against the brood-combs, having a very thin top-bar to the brood-frame, in order to get them still closer. Although there are many obstacles in the way of doing this, I still think the object a desirable one.*—In regard to the zinc honey-boards, I do not think I should use them in getting comb honey, as we have never had brood enough in the sections to do any harm. With narrow sections and no separators, there might be more of a tendency for the queen to go up into the sections. I grant that, with the Heddon sections, you can have sections of different widths easier than with our arrangement.

* The article on page 306, from friend Doolittle, was received after the above was in print. You will notice that his experience corroborates what I have said.

HIVES AND CASES, ONCE MORE.

ALSO SOMETHING IN REGARD TO BROAD SHALLOW FRAMES CONTRASTED WITH NARROW OR TALL HIVES, COMPARATIVELY.

EDITOR GLEANINGS:—While making no claims in this behalf, I have been a bee-keeper much longer than Mr. Heddon; and although never a specialist, I have kept as many as 100 colonies; and when a boy, before movable frames were invented, I took from chambered box hives as high as 1400 lbs. of box honey in one year. I have seen or used almost all kinds of hives, and have made many experiments, and at great cost; and I will frankly say, that the moment I am satisfied that there is a better hive and case than the ones I have, I shall adopt them.

Let us go back to first principles a moment. I have always claimed for the L. hive and frame, as its prime point of excellence, the large surface above the brood-frames for surplus honey. Like Mr. Heddon, I have never succeeded with side-storing in the brood-chamber. I have had wide frames filled with new white comb, and with *fdn.* also, remain *empty* all the season in hives that were filled above. Now, we can not question Mr. Doolittle's success with that system as an adjunct; yet while he has succeeded admirably, I believe it to be more because of his splendid manipulation, and more particularly to his securing the *force* to do the work at the right time, than to his hive and plan of side storing. I think he, expert as he is, and a master, has never equaled, with the Gallup frame, such results as have been secured with the Langstroth.

We believe, many of us, that he could produce larger results with the L. frame. If it were to be a question, however, as between an L. hive 1 1/4 x 18 1/2 inside, and a Gallup hive, I should choose the latter as the safer and more convenient. Surrendering the vital point of superiority so long claimed for the shallow frame by narrowing the hive, would have sounded very strangely six years ago, and it does now to me. No one can question Mr. Heddon's success with it. He could succeed with any hive. Nor can we question his preference for it. It is true, I have not used it, but I have observed its workings in another apiary. I do not agree with him, that tiering up is essential to success in any system, not if he means throughout the apiary. I notice that Mr. Doolittle, in his letter on page 93, touches upon this. Now, I do believe tiering up to be essential to the *highest* success with some colonies. A few years ago I thought the only sure way to bring bees right up into sections was to use the deep wide frame, or lift up brood between them. Put on in the center, and limiting the number to the strength of the hive, with division-boards, I never failed. Now, while, as a general thing, I think I can do as well by just at the right time circumscribing the brood-chamber to 8 frames, and forcing into cases, still I find some colonies will do better with the deep wide frames than in cases, and I use some of them every year. I have found the cases more convenient, and the honey more evenly built, than in wide frames. With the latter are used, of course, hanging separators, which are of wood. I have never found the least objection on account of the outside sections being over dummies, and there is a slight air-chamber between the case and outer hive.

It certainly is a mistake to suppose, that in cool nights, when the thermometer runs down to near 32

degrees, that heat is not lost through a thin wall of $\frac{1}{2}$ in., or to assume that that is not a loss. Why! if not well covered, work above is often stopped. Having the cases well protected by good quilts we know to be a great advantage in cool nights and during cold rainy weather. But, one important point Mr. Heddon does not touch upon, and that is, to have the room for expansion below, to get the forces ready for the honey-flow. It is difficult to believe, that as powerful a force can be developed and held without swarming in an eight as in a ten frame hive. Possibly as great an aggregate result in honey from a given number of say 25 original colonies might be obtained by increasing stocks and withdrawing brood, but I doubt it; for I think it is true, that 50,000 workers at the honey-flow will store more in one hive that the same number in two hives. *Concentrated force counts.* J. W. PORTER.

Charlottesville, Va., Feb. 21, 1884.

A SUGGESTION IN REGARD TO ARTIFICIAL FERTILIZATION.

SOMETHING ALMOST TOO WONDERFUL TO BE TRUE.

EDITOR GLEANINGS:—I have been a bee-keeper since 1872, and for the past eight years have made bee culture my exclusive business; and although I have been fully alive to all the many new ideas and improvements in the art, yet in no one particular direction have I given more thought and experiment than in that of controlling the fertilization of queens. I persisted in the belief that this could be done in some way; but my experiments in that direction invariably resulted in failure, and I had begun to look upon the occasional articles in the journals, on the subject of fertilization in confinement, with disgust, and upon their authors with pity; and but for an accidental circumstance, I should have continued to look upon a solution of this theory just as unlikely as that of perpetual motion.

In September, 1882, I removed some queen-cells from a queenless colony, with a view of placing them in nuclei; but in trying to separate two that were built close together, I accidentally cut into one (which, by the way, was barely sealed), exposing the larva at the base. As it was a fine cell, I thought I would try to save it, as I had often done before, by so placing it in the comb as to perfectly close the rupture; and as the place selected for it was in a small patch of drone comb containing unsealed larvae, this was not difficult, as the drone larvae in the broken cells assisted in forming a cement that did the job nicely.

Some days afterward the cell hatched, and the next day—about 18 hours after—I saw the young queen deposit eggs! I could hardly believe my own eyes; but the indisputable facts were before me. In vain I looked for a satisfactory solution to the phenomenon; but as I was positive I had made no mistake in my reckoning, I had no alternative but to accept the old, but none the more satisfactory one, that it was a "freak of nature," or, as is a more common term in bee culture, a "sport." Could it be possible that the embryo queen could have become fertilized while yet in the larval state by having come in contact with the larvae of the drone, and remaining sealed with it during this period? It did not look very reasonable, certainly, but yet was it any more

unreasonable than any other theory by which it could be explained?

The circumstance which at first seemed such a puzzle continued so to occupy my mind during the winter, that, notwithstanding my doubts, I determined to prove either the truth or falsity of the theory at my first opportunity, and so end the matter. Accordingly on the 20th of May, 1882, when swarming had fairly commenced, I performed the operation on three queen-cells, varying in age from four to seven days from the egg, inoculating them with drone larvae of about the same age, and awaited results, which were such as to fully meet my most sanguine expectations. One fertilized in the natural way; one missing soon after hatching; and the third laying after she had been but 17 hours from the cell! This was enough, however, to prove that the thing could be done, and I was more than satisfied with the experiment.

Of course, this was followed by persistent experimenting during the entire season, and with extremely satisfactory results. I will simply say, that I have now in my apiary 53 laying queens, not one of which has ever been out of the hive. These queens are in every respect first-class; and although they remain in the cell about two days longer than the usual time (they hatch in about 18 days from the egg), they have commenced laying at from 15 to 20 hours after leaving the cell. There is no way of distinguishing their progeny from that of queens mated in the natural way, and they in every instance take the characteristics of the parents as faithfully. I sent four of these queens to as many of my beekeeping friends, with a request that they test them carefully, and report to me; and in no case has any peculiarity in the queens themselves, or of their progeny, been observable.

I have no doubt but this statement will be received by many scientific bee-keepers with severe criticism, and perhaps more likely with scorn, even; but if there are any who prefer to accept theory rather than actual results, of course they have the privilege of enjoying their wisdom. For my part, I shall accept the practical, especially where it combines such numerous and valuable advantages over the theoretical.

In conclusion I will say, that I have never reared queens to any extent for sale, nor do I intend to do so; but as I expect to continue my experiments still further the coming season, I will send a limited number of fertilized queen-cells free of charge to such among our prominent bee-keepers as will signify their desire to receive them, and who will give them a fair and thorough test, together with a full report of the result for publication. B. F. LEE.

South Oxford, N. Y., Jan. 20, 1884.

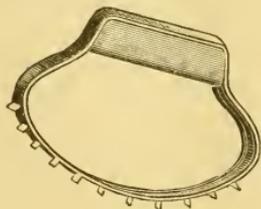

Our friends will notice that this paper has been with us some months. At the first reading I had about as much faith in it as I should have had, had our friend claimed broadly that he had discovered perpetual motion. I confess that I feel something the same way in regard to it now; but when he tells us he has 53 queens fertilized by this process, that have never been outside of the hive, we are obliged to conclude that we do not know very much about these things after all, especially if it should transpire that this idea can really be put in practice by any one. I think I published an editorial a year or two ago about seeing a queen of but a

few hours old go through the motion of egg-laying. Of course, no eggs remained in the cells after she withdrew her body. I do not see any difficulty in trying the above, unless it is in inducing the bees to accept and rear queen larvæ that has been thus "tinkered" with. If I understand friend L., all that is necessary is to scoop out some of the milky liquid food from drone larvæ, and put it upon the larvæ of the queen, and when she hatches she will not require fertilization. As a queen ordinarily does not lay until about 8 or 10 days on the average, we should be several days ahead, even if she remained 2 days longer in the cell. Will not some of our Southern friends report in regard to this immediately? You will observe, the matter can be tested in say ten days or less during the swarming season.

FASTENING FOUNDATION IN FRAMES AND SECTIONS.

SOME NEW IMPLEMENTS FOR THE PURPOSE.

AFTER making and selling quite a number of the Easterday machines described on p. 418, Vol. XI., we found quite a tendency for the tin points to bend over. They sometimes also split out of the wood. On this account we have thought best to have them made entirely of metal, as in the cut below, each point being braced with a little bit of solder, so as to make coming loose an impossibility.

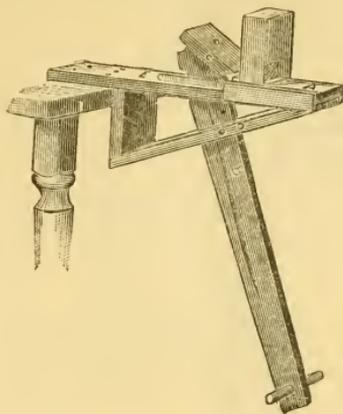

WIRE-IMBEDDER.

The machine is made of one single sheet of tin, made something like the handle of a tea-kettle, only narrower. Where the hand grasps it, a sort of "boss" is put in to make it easier to hold by. After the fdn. is laid on the wires, as we have several times explained heretofore, by a rocking motion of the tool the points are made to press the wire down into the wax. Of course, the wax must be warm enough so that the wire will sink readily. Our friend Oliver Foster sent us an implement some little time ago on the same plan, only the strip holding the points was on a straight line instead of a curve. This does the work nicely, but it needs a pretty powerful pressure to sink the points all in at once; while with the machine shown above, a small girl can do it readily without much fatigue.

Our next implement is a machine devised by Mr. Gray, and is an improvement on the Clark fastener. It came about in this way: One of the friends sent us a machine to be worked with two treadles, which did the work so nicely that I paid some ten or fifteen dollars for the privilege of making them for

sale. Before we got to making them, however, Mr. Gray said he thought one treadle could be made to do the work, therefore we have the machine shown below:

GRAY'S MACHINE FOR FASTENING FDN. INTO SECTIONS.

To understand this you will need to remember that the block A slides in a groove, and is drawn back by a coiled spring E. To use it, lay on a section as shown in the cut; put your foot on the treadle until the hardwood block comes down on to the edge of the fdn., mashing it firmly into the wood. You will observe, that the treadle is made of a hard piece of wood, cut out in such a way as to form a forked treadle, as it were—one piece holding the block that fastens in the fdn., and the other piece being pivoted so that, when the treadle is moved far enough, it strikes the sliding block A, and pushes the section and all clear out of the machine; in fact, the sections can be made to drop into a basket so as to save the time of the operator. This movement of pushing the section out from under the hardwood block has the effect of bringing the fdn. straight up, just as we want it; and when the machine is adjusted properly, the sections will drop into the basket with the strip of fdn. hanging straight down, just as we want it to get nice comb honey.

Now, friends, you can have the first-mentioned machine made at any tin-shop by showing them this picture; and any tolerable carpenter ought to be able to make the latter machine in the same way. If I should stop right here, and not give prices at which we can make them for you, I suppose some of the brethren would think it a great deal better; and then I should not be open to the charge of using the pages of GLEANINGS as an advertising medium for our own wares. However, as a great many of you could not get them made at the prices we can make them for you, even if you did get them just right, I think I will hazard giving prices, even at the risk of having it thrown up to me that this latter item is only another "dodge." The price of the wire-imbedder is 15 cts. each; \$1.25 for 10; \$12.00 per 100.

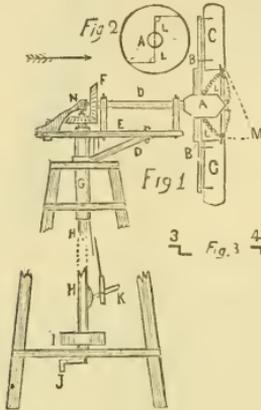

The price of Gray's starter-machine is 75

cts. each; \$6.00 for 10; \$50.00 per 100. We give the prices by the tens and hundreds for the benefit of supply-dealers.

HOW TO MAKE A HOME-MADE WIND-MILL.

FRIEND WHITE GIVES US FULL PARTICULARS AND DIAGRAMS.

THE description which I give below is of a home-made wind-mill.—my own invention and construction. I use it to run a drag-saw, to saw my wood; also to run a buzz-saw for hive-making, a grindstone, etc.

Description is as follows:

- A.—Hub of wheel.
- B.—Shoulder on spokes, 10 in number.
- C.—Wings.
- D.—Hollow shaft.
- E.—Swinging crane.
- F.—Bevel gear, 5 to 1.
- G.—Pipe of wood or iron, around which crane E swings.
- H.—Small shaft.
- I.—Pulley.
- J.—Crank.
- K.—Lever for gearing and ungearing mill.
- L.—Springs.
- M.—Springs attached to corner of wings.

Figure 1 is a view of the mill as seen when in operation. A represents the hub of the power-wheel, which has ten spokes, held in their places by a wagon-wheel tire resting on shoulders cut in the spokes, as seen at B. These spokes extend beyond this tire, forming arms to which are hinged the wings C. This wheel is held in position by a hollow iron shaft D, resting in bearings on the crane E. F is a bevel gearing, 5 to 1. G is a stationary pipe of iron or wood, around which the crane E swings, allowing the mill to adjust itself to the wind, from whatever direction it may be blowing. H is a wooden shaft; inserted in its upper end is a short piece of hollow iron shaft, having its bearings in the top of the pipe G. I is a drum-wheel running a round belt to a grooved pulley on my buzz-saw mandrel. A pitman is attached to the crank J, the other end to a pendulum that has a roller on its lower end, running between two guides. My drag-saw is attached to this pendulum near its lower end. This arrangement works nicely. K is a lever to throw the mill out of gear. L L are wire springs attached to another tire having ten holes in it at equal distances apart, through which a $\frac{3}{4}$ iron passes, that are attached to the corner of each wing seen at M. When the lever K is in the position shown in the cut, the springs L are allowed to operate on all of

the wings, by means of the tire to which they are attached, turning them in a diagonal position in regard to the course of the wind.

To throw this mill out of gear, press the lever K down and in against the shaft H. This operation draws the wings back straight behind the arms to which they are hinged, allowing the wind to pass freely through. It has effect by means of a wire and chain which pass through the hollow shafts over a small pulley between the two gear-wheels (this chain has two swivels). Its course, after leaving the hub A, is shown in Fig. 2. It can be seen, that the motion of this mill is regulated greatly by the giving of the springs L. It can be further effected by centrifugal force by placing a weight on the lever K.

This mill is on a tower 25 feet high. The wings are four feet long, 17 inches wide, and sweep 12 feet.

I have had considerable experience with wind-mills, having built and put in operation three different kinds. I have letters patent on one, but none pleased me as well as this. Wind is a cheap source of power, and available to most people. It is evident, judging by the number of letters I receive asking for information in regard to my mill, that a good plan for a home-made wind-mill is sought by many. So, Mr. Root, if you will suggest any improvements on this mill, they will be gladly received.

F. C. WHITE.

Euclid, Cuyahoga Co., Ohio, April 14, 1884.

Thank you, friend White, for the full explanation you give of your wind-mill. I, too, when a boy, made wind-mills, and for many years of my life made them a study; and while the one you describe is very ingenious, and will without doubt work nicely, I should be inclined to question a little whether very many of our readers could make one cheaper than to buy it at a wind-mill factory. I see by circulars received that they are now offered quite reasonable; and such numbers of them are being used in various parts of the country that manufacturers have been enabled to give very nice work for a comparatively small amount of money. Where one has the shop and tools and plenty of time, however, together with the necessary mechanical skill, no doubt he could make one such as you describe, at quite a saving. I notice that you dispense with a vane entirely. It seems to me there ought to be some sort of a weight on the opposite side of the tower, to counterbalance the weight of the wind-wheel. The great difficulty in using this wind-mill to run buzz-saws is the uneven speed, although one may get along with this very well, providing he does not have to employ hired help. In that case he might save money by having a steady, even, regular speed. Of course, there is a saving with wind-mills in not being required to hire an engineer, or to furnish fuel; but they seem to be adapted only to certain kinds of work. When I used to print GLEANINGS by wind power, I had my press so arranged that I could run it by a treadle when the wind lulled; and by proper mechanism; whenever the wind came up to speed it took hold of the press and gave me a chance to rest; that is, I could run the mill ahead of the wind whenever the wind was too slow. Perhaps such an arrangement might be adapted to a buzz-saw, or other similar work.

THE OTHER SIDE.

HOW I DECREASED FROM 41 TO 6.

THE charge against the bee-journals, that they publish the favorable side of bee-keeping in a rather exaggerated form, and that these publications are misleading, because the unfavorable side is not given, is, I think, well founded. But the fault is not entirely that of the journals; for those who fail, seldom report their failures for publication. It is but natural that we are not anxious to advertise our want of success. A failure generally implies a want of knowledge of the business, or of neglect to put that knowledge into practice; and a large majority of men are not especially anxious that the public should be advised through the papers of their ignorance or incompetency. On the other hand, every novice who meets with some success hastens to publish it to the world, and advertise his ability in the business; but if he fails next year, as is often the case, nothing is published about it. Queen-breeders and supply-dealers are also responsible, to a great extent, for the publication of highly colored favorable reports, to the exclusion of the unfavorable side, that they may entrap as many as possible into the business, to create a demand for their wares.

A few have reported the unfavorable side of bee-keeping, and have been placed under the head of "Blasted Hopes." I do not like the heading, and now protest against being put under it. You have "Reports Encouraging;" why not give us "Reports Discouraging," instead of "Blasted Hopes"? You need not fear having your pages crowded with unfavorable reports; for though there may be three failures to one of success, you will have a dozen successful reports to one of those who fail, for the reason that I have intimated.

But I proposed to tell how I decreased from 41 to 6 colonies in the season of 1882-'83. In the first place, I will say I am not a novice—not an A B C scholar (it may be that is the reason for my want of success). I have used the L. movable-comb hive for 20 years; Italian bees for 15 years; have been in the queen business; put out my circular with the deceptive statements about Italians gathering large quantities of honey from red clover, etc. I did it ignorantly then, but know better now. I have read such standard books on bee-keeping as Langstroth's, Quinby's, and Cook's; and I may be excused for not having read the A B C book, when I state that I have read GLEANINGS from the first number to the last, and at one time took two other bee-journals. I mention this simply to show that I try to keep posted in modern bee-keeping; but I have never made it my entire business, and consider myself only an amateur. I have kept bees for the love of them and the love of honey, and have generally met with moderate satisfaction, with some bad failures, as this report will show.

Instead of beginning with "spring count," without saying any thing about winter losses, as is usual, I should begin with fall count as I went into winter quarters. In the fall of 1882 I had 41 colonies; in the spring following, only six were alive—two very weak. How did I do it? I did not raise queens; did not extract from the lower story; I did not sell bees by the pound; I did not let them starve. They were all strong in bees, with an abundance of honey, leaving 400 or 500 lbs. in the hives; did not neglect to prepare them for winter in such a manner as I

thought safe—some in various ways, in single and chaff hives, all on their summer stands as usual. "How did you lose them then?" Very easy; they just died. "Dysentery?" Yes, but I can't say what caused it or what killed them.

Again, the 6 colonies, the spring of 1883, I built up to 12; bought 2 colonies, and made 10 nuclei out of them with Holy-Land queens, which were easily built up into good colonies, with the quantity of combs and honey I had on hand; went into winter quarters with 22; now, April 10, I have 7 left, with the prospect of only 4 getting through.

Now allow me to show how my account stands in due form. Capital invested, Nov. 1, 1882:

10 chaff hives, at \$3.50 each.....	\$ 35 00
40 two-story hives, at \$1.50 each.....	60 00
41 colonies with bees, combs with honey, at \$5 00 each.....	205 00
Extractor, knives, bee-hats, etc.....	12 00
Total.....	\$ 312 00

1882-'83.	ACCOUNT WITH APIARY.	DR.
To interest on investment, 6%.....	\$ 18 72	
To 2 colonies bees bought.....	8 00	
To 2 Holy-Land queens.....	5 00	
To 1 bee-journal.....	1 00	
To 35 colonies lost, at \$5.00 each.....	175 00	
Total.....	\$207 72	

1882-'83.	CR.
By 350 lbs. honey, at 15c.....	\$ 52 50
By 14 colonies increase, at \$5 00 each.....	70 00
Total.....	\$122 50

Amount to balance.....	\$ 85 22
------------------------	----------

Total.....	\$207 72
Showing a loss of \$85.22, without counting time.	

Now, I might make my account out in the usual way of Reports Encouraging—see two reports, GLEANINGS, March 1, page 171, by beginning in the spring of '83 without any account of capital invested, or winter losses, and show a very different result, and that without lying bad, by keeping back a part of the truth; thus, 6 colonies to start with in the spring.

To 2 colonies bought.....	\$ 8 00
To 2 queens bought.....	5 00
To 1 bee-journal.....	1 00
Total.....	\$ 14 00
To balance.....	108 50
Total.....	\$122 50

By 350 lbs. honey, at 15c.....	\$ 52 50
By 14 colonies* increase.....	70 00
Total.....	\$122 50

Such a report would certainly be misleading. S.

Are you really sure the statements in your circular, about Italians and red clover, were deceptive, after all, friend S.? Italians do work on red clover, and gather large quantities of honey from it. The fact that some seasons they do not work on red clover proves nothing, for the same is true of almost all honey-producing plants. I think friend S. should have avoided a statement so unkind and uncharitable. It would seem to me evident, from the face of the report, that the locality is one where the bees gather honey unwholesome for wintering, or, at least, very often do. Had he not requested his locality as well as name to be omitted, I should have been pleased to give them.—It has never occurred to me that the expres-

*A4 are dead, but they must be charged to next year's account.

sion "Blasted Hopes" deterred people from making reports; and if it is thought best, we will change it to "Reports Discouraging." You might charge me with making it my business to defend bee culture. Well, that is my business, and I expect it to be so long as I live, to defend bee culture against unfair or unjust charges. But, of course, the real difficulties and discouragements I want to have reported just as truthfully.

DEATH FROM BEE-STINGS.

IS IT LIABLE TO HAPPEN, AND WHAT CAN BE DONE WHEN SYMPTOMS SEEM DANGEROUS?

A FEW days ago I had a woman helping me in my apiary. She got stung once on the left upper eyelid. In ten minutes from the time she was stung, she was in most dreadful condition. When stung she went into the house and rubbed a little soda on the place. I went in after her, and found her lying, seemingly speechless. Her face was swelled, and her nose was completely closed, and her throat nearly so. She was in great pain. I at once applied a wet towel to her head, and bathed her face and hands in cold water. This gave no relief. I had her bathed in very warm water and applied towels wrung out of hot water and gave her about a gill of wine to drink. This gave relief. After continuing for some time she continued very sick until late in the night. I will try to give her feelings in her own words. First a dead feeling of feet and hands, as if her flesh were asleep, followed by being very sick, and a severe vomiting, and then pains all through the whole body. She said her very heart pained her, and this brought on palpitation of the heart, and she did seem to be in a dangerous condition for about six hours. I would state that she had helped me often before in the apiary, and I have seen her stung as often as five times, and she not leave the hive, and no harm, except a slight swelling afterward. Now, Mr. Root, as we have some doctors among our bee-keepers, can they tell us why this one sting came so near killing at this time, when before so little harm? Are we all liable to the same harm? If so, is not bee-keeping a little dangerous? I should like to have your opinion, and that of some of the doctors too, and I should like to know what to do in such cases. What must we give for a bee-sting when symptoms seem dangerous?

W. W. EDWARDS.

Abbeville C. H., S. C., March 14, 1884.

Friend E., although such occasions as you mention are of comparatively rare occurrence, there are enough of them to make it quite desirable that every bee-keeper should know what to do at such a crisis. I have sometimes thought that occasionally a bee is found during the height of the honey season, having an unusual amount of poison in his poison-sac, or, may be, having poison of unusual virulence. I have been led to infer this, because once in a great while I get a sting that is extremely painful. Ordinarily I may be stung a hundred times, and pay little if any attention to it. But once in three or four years I get a sting that gives not only tenfold more pain, but lasts a great while longer. These severe stings, it seems to me, come during the height of the honey-flow—that is, I seldom get stings that hurt

very badly when little honey is coming. In the spring, when bees are first set out, or in winter time, if they happen to sting at all, it seems to be only about half a sting. It seems to me the greatest danger that is to be feared is, that the swelling that often ensues from a very severe sting may close the breathing-passages, or stop the respiratory organs. A case of death has been reported in England, where the patient simply choked to death. Very likely the application of water would be beneficial to alleviate the swelling; and although I have not consulted any medical authority, I would suggest that the throat and breathing-passages be kept open by mechanical means till the swelling can abate. A tube of some sort, I think, might be inserted in the throat so as to keep a passage open to the windpipe. We have many of the medical profession among our readers, and would be glad of suggestions from these brothers. I presume you are all well aware already of my want of faith in remedies of any kind for ordinary bee-stings. Friction, or any such disturbance, is the best way in the world to produce swelling; and although I have tried great numbers of remedies, I am more firmly satisfied every time, that the best way after removing the sting, is to let it alone.

WALNUT WOOD FOR SECTIONS.

ALSO SOMETHING ABOUT CRATES AND CASES FOR HONEY.

LAST season, "as the readers of GLEANINGS know," our State Convention was held at the great Southern Exposition at Louisville; and at the same time, the Exposition Co. gave an inducement to Kentucky bee-keepers to have a "honey show" for one week. Knowing as I did that thousands of people would inspect this mighty show of honey, set me to experimenting as to how to get my honey to show to the very best advantage. Being a professional artist, gave me some advantage in the effects of colors, one upon the other when placed side by side; for instance, if we place a light surface and a dark surface close to each other, the dark will appear darker, and the light lighter, than they would if only the one color were present. I took advantage of this in giving my honey the desired appearance of color; and as some who saw the "show" will remember, my honey in sections had a peculiar rich creamy appearance, not "chalky white," but a shade whiter than rich cream. My honey was in planed basswood sections, size six to fill a Langstroth frame, as made by A. I. Root (my favorite size and shape of section). I colored the sections with burnt umber mixed with turpentine, which gave them the appearance of walnut lumber, or sections made of walnut wood. I colored them before putting in the hive. Honey in these sections appears very white. I then made my crates a rosewood color, rather red rosewood; the brown sections and reddish cast of the crate gave the honey the cream effect. I also made some crates of red cedar wood, which I have now on hand for exhibition, that gives a still better effect to my eye. The thought has occurred to me since, why don't we have our sections made of walnut instead of basswood, and stop cutting down basswood-trees. Wal-

nut lumber can be had at all times and places, and is much the nicest of any thing for sections. Of course, it is some harder to work, but that is a small matter.

This season I shall have my sections made, six to fill a Langstroth frame, and made of walnut. What say you, Mr. Root? Will you make them? I will also make my crates of walnut or cedar; that is, the strips on the front sides where the glass is; tops and bottoms of clear pine. The effect is very pretty. Try it, and see if I am not right about it. One other thing: I shall this season use for starters in sections only very narrow strips of thin foundation.

FDN. NOT DRAWN OUT BY THE BEES.

For me, full-size starters of foundation won't do. We have been using some honey on the table of late, where full-size starters were used, and the honey was stored in the best of the season, and the bees added wax enough to it to make the combs, and left the foundation in the middle of the combs just as I gave it to them, and we scrape the honey off and use it and lay the foundation away to cut up for small starters another season. Talk about economy, who can do more than that—use the same foundation over again? No patent. I should like to hear from others on the subject of using walnut sections.

Emineuse, Ky., Feb. 3, 1884. W. T. STEWART.

Friend S., your suggestion may be a good one, but blackwalnut is the most expensive kind known here. It is worth, in fact, from 50 to 60 dollars per 1000, whereas basswood is worth only 18. We should have to charge for blackwalnut sections from 10 to 15 dollars per 1000. In regard to your fdn. in the sections, it seems to me it was not made as thin as it should be; and I shall still think so, even if you did purchase it of us. We are doing better now, however, and I do not believe the starters we send out now will leave any noticeable fishbone, even if the bees should get lazy and forget to do their part.

CHAFF HIVES

Arranged for Reversing Common Suspended Frames.

THE WAY FRIEND BLACK DOES IT.

FRIEND ROOT:—I think I have a good thing in the manner of reversing common suspended frames, and must share it with my bee-keeping friends. I have made and used chaff hives during the last two or three years, which are so arranged that the frames in the second story hang parallel with those below. This is accomplished by making the second story one inch longer than the lower one, and hanging movable blocks in one end. I send you one of the blocks. Among the advantages of this arrangement are:

1. The frames are all of the same size.
2. Any part of the brood-chamber can be reached by removing three or four frames from above.
3. Side stinging can be practiced with great facility.
4. The combs can be reversed in the second story, and the blocks which support one end of the frames serve as spacing-boards.
5. Wide frames filled with sections can be reversed in the second story. Some bee-keepers remove the sections from the wide frames when partly finished, and replace them upside down, that the comb may be attached to all sides of the sections.

By my arrangement, eight sections are reversed in less time than one by the old method.

We must have some method of reversing our frames at pleasure; but let us not change our frame one particle, in order to do so. If a change is necessary, let it be made in the hive, and not the frame. I have no less than seven different styles of hives, but use the Simplicity frame in all of them.

You made a mistake in my name when you wrote the editorial referring to drone-traps. My name is not J. D. Black, but—

G. D. BLACK.

Brandon, Iowa, April 12, 1884.

Friend Black sends us a movable block with his letter. It is like the spacing-board shown in our price list, on one side, while the other side is rabbeted out, and has a tin rabbet let in which comes just right to support the frames in the upper story. When I planned the chaff hive this was considered; but I so much disliked loose blocks about a hive that I did not adopt it. Since friend B. proposes to make it answer also for setting frames upside down, it may be well to consider it again. Of course, it would contract the space of the upper story somewhat. We presume that any who wish to try this arrangement will have no difficulty in making the blocks of the proper size to make their chaff hives hold frames running parallel with the lower ones. Friend B. has his chaff hives so made that movable blocks are needed at only one end of the frames. Very likely this will answer; but it seems to me it would be a little awkward.

FRIEND STANLEY'S AUTOMATIC HONEY-EXTRACTOR.

SOMETHING FURTHER IN REGARD TO THE IMPLEMENT.

FRIEND ROOT:—We have just received GLEANINGS for April 15; and as you take the liberty (which is entirely just and right) of criticising the Automatic honey-extractor, we should like to make a brief explanation regarding your points of criticism.

1. You speak of the great size and weight of the machine. We make two sizes of can, the diameters being 26 and 30 inches, the 26-inch can being for the L. frame, or any frame not more than 9½ in. deep. The 30-inch can will take any frame up to 12 inches deep by 20 long. Now, will any practical bee-keeper say that a can of either of the above sizes, with the crank at the side, is not better than a can 18 to 22 inches in diameter, with the crank at top? As regards the weight, we will say that the extractor for 4 L. frames will weigh complete about 45 lbs., while the large size will weigh about 60 lbs. We do, it is true, use a much heavier gear than is used in any other extractor that I know of, and that is one of the best things about our machines. As the crank is long, and the inside work is all put up by a first-class machinist, and all the shafting is cold rolled, made exactly to our order, the machine is as easily operated as any of the cheaper extractors, and the size and weight of the machine will hold it still so that one heavy comb put opposite to one light one will not set the thing to dancing around the room, as is often the case with the light machines.

2. The expense of the Automatic is no more than would be charged for other makes of extractors, if the same material were to be used, with none of the

improvements that are combined in our machine. If the machine is wanted for two frames only, we furnish it for \$2.00 less. The extractor for two Langstroth frames costs but \$16.00, all complete; and if at any time it should be wanted for four frames, the two comb-baskets can be added for \$2.00, as all the parts use the same, and the baskets can be put in place by any one in ten seconds.

In your remarks you forget the fact that our machines all have a "brake" that stops the motion much more quickly than any other extractor can be stopped, and that entirely without the use of the crank. We are receiving orders nearly every day from among the best and most progressive honey-producers throughout the country, and we trust they will report.

G. W. STANLEY & BRO.

Wyoming, N. Y., April 18, 1884.

You speak about the extractor "dancing around," friend S. That reminds me that friend House, who is just now reviewing and revising the A B C book, says he had trouble in getting his extractor to stand still and firm. Now, every extractor should be fastened down so it *can't* dance; and if you can not get a stand that will remain firm otherwise, have it fastened against the wall with some good stout screws, and don't start work till you can put the honey-combs in with nothing in the other, if need be, and have every thing still and solid.

WIRING FRAMES BY MEANS OF BENT WIRE NAILS.

A SUGGESTION IN REGARD TO THE MATTER.

NOTICE that some one recommended in your journal about a year ago, the use of wire nails $\frac{3}{4}$ in. long, to be used in wiring frames. At the time, you recommended the use of round pliers for bending the nails into hooks. I tried the pliers, but could not bend the nails to my satisfaction. Some would be long, and some short hooks; some points would touch the frame so that I could not put the wire over them, and others it would slip off from. At last I made a tool like the one shown below, and

MOFFAT'S TOOL FOR BENDING THE POINTS OF WIRE NAILS FOR WIRED FRAMES.

it works complete. Hereafter I shall use wire nails instead of perforating the frames. I can wire a frame in less than half the time (after the nails are driven). It can be done direct from the spool, without kinking, and the bees seem to like it just as well. I think you might be able to make and sell them to the bee-brethren for 10 or 15 cts each. As they can go only just so far over the point of the nail; by giving them a half-turn, every hook will be of the same length, and no point can touch the wood, because the thickness of the tool will be between the point and the wood. If you think this of any use you are at liberty to use it, as you may think best, for the benefit of the brethren.

S. L. MOFFAT.

Washingtonville, N. Y., April 2, 1884.

No doubt your implement will answer

nically for the purpose, friend M., but we already have such a multiplicity of tools in our list that we could not well undertake to furnish another, unless it is something generally wanted by almost all bee-keepers. With our machinery, we find it much easier to wire frames by drilling the holes than to use nails.

Humbugs & Swindles

Pertaining to Bee Culture.

BEE-KEEPERS SHOULD BEWARE ABOUT TRUSTING THEIR GOODS TO IRRESPONSIBLE COMMISSION MEN.

I CAN not help saying a little more about that dishonest commission firm that Mrs. Axtell speaks of on page 193. It was very kind in her to speak so well of their lawyer, R. E. Jenkins, and I can assure the brethren that he is one of the finest of Christian lawyers, and an eminent man in his profession.

It chanced that I know both Mrs. Axtell and the commission firm in question, as well as something of their recent dealing with her; and I know, too, that while that firm ought to be pointed out to all bee-men who ship to the Chicago market, she is too kind to ever publish their name; and once last summer she asked me to say nothing about the matter. I won't! but I have had some deal with them myself, that I am sure she will allow me to mention. The firm, when I first knew it, was Beek Bros.; then Beek & Clark; then Beek & Robinson, and now Beek Bros. again. In October, 1878, I took 1500 lbs. of very fine comb honey to Chicago, intending, as I had done before, to leave part with them—Beek & Robinson—and part with others. But Beek urged me so hard to let them have it all, and he was such a kind and honest-looking old gentleman, that I finally let him have the entire lot, even contrary to the advice of friend T. G. Newman and Bradstreet's Reporter. He had, before this, handled small lots of honey for me at good figures, and he seemed to want this lot so much; more than all, he seemed to have such love for me, that I felt as though I would be doing an unkind act not to let him have it.

They paid me \$25 down, and by June of the next year I had received altogether \$90, and this is all I ever got. The following fall I called on Beek, and asked the privilege of looking over his book account of the sales of my honey. With a sickly grin, he replied that the firm was then Beek Brothers, and that his former partner, Robinson, was out of town, and had the books with him; and that's all the satisfaction I had.

They paid none of the freight charges, and the \$90 was all I ever received in any shape. During the time they claimed to be holding my honey, I would receive no reply to about two letters out of three; and when they did write, it was short and angrily. They knew they had my whole crop, and handled me as they chose.

It was as fine a lot of comb honey as I ever marketed, and honey was bringing a fair price. This Beek frequently changes his position from one part of South Water street to another, and has an easy way of going into bankruptcy, and forming new partnerships about as often. Peach-growers of

Western Michigan could tell some sorry tales of his dealings with them.

Knowing what I do of this man Beek, I feel it nothing short of duty to warn all shippers against having any deal with any firm with which this Beek is connected. I do not know his initials.

Medina, O., March 26, 1884. WALTER B. HOUSE.

On page 263 of our last number, friend Stewart gave us an article in regard to sending honey to commission men. That article should have followed the above. It seems to me yet, that there should be some way to get hold of a man who changes the name of his firm in order to get out of settling his accounts, and I am glad of the opportunity of warning bee-keepers against a man who has been up to that sort of business.

THE ISLAND OF CUBA AND HER CAPABILITIES.

DO BEES GET LAZY IN WARM CLIMATES?

I AM not the owner of this enterprise. The apary is owned by J. & P. Casanova. The Casanova brothers own large estates in Cuba, as well as in the United States. They are Americanized Cubans; though born in Cuba, they were educated in the United States, and are enterprising and go-ahead men. Not only are they the first to try the experiment of keeping bees in their native country upon the most improved plan, but the first in almost all enterprises that have for their aim the improvement, the advancement, and general welfare of their country. With this last enterprise (bee-keeping) they are bound to succeed. After a two-months' experience here I am more than ever impressed with Cuba as a home for the honey-bee. For 60 days there has been no holding up—to-day only repeating itself to-morrow; sunshine and flowers and honey, and the end is not yet; for if we are to judge by appearances, there seems to be no falling off of bloom in this great hot-house of nature's own building, where the desert winds that sweep the plains and foot-hills of California, carrying death in their very breath, never come; where a six-months' imprisonment within their ice and snow bound walls is not necessary; but basking in God's own sunlight, 365 days in the year, the Cuban bee works on, giving the lie to foul calumny's polluted touch, that "bees get lazy in a warm climate, and will not work." They do not. Let any who have such foolish ideas as the above in their heads, come to our apiary now in mid-winter, and note with what energy they hurry to and from their hives. Place a sheet of foundation in a brood-chamber, the next day finds it drawn out and filled with eggs and honey, tells but too plainly that they have lost none of their ambition by being transplanted from the North to this climate beneath a tropical sun. Never have I, in any country or climate, seen better prospects for success than I see here.

HOW MUCH HONEY HAVE WE TAKEN?

We are not running for honey this year, it being the intention of the owners to increase this home apiary to 500 colonies, then establish branch apiaries at different points on this vast estate, till thousands of colonies contribute to the grand result. We take but little heed to the exact amount of honey coming in; but to get it out of the way so the queens can lay, and that we may have brood to divide, is about

all the note we take of it; but it is honey, honey, all the time—too much honey. Bee-keeping is no experiment in Cuba. For many long years before the movable-frame hive was invented, have these busy little workers contributed their mite, in the shape of tons of honey and wax, to enrich the pockets of man, and they were kept (and are to-day) in the most primitive way—hollow logs, and boxes about five or six feet long, laid horizontally, being all the hive the native ambition has ever aspired to provide as homes for those that work so incessantly and uncomplainingly for their benefit. Their mode of taking the honey is as primitive as the hives. The boxes being open at either end, they smoke the bees back to the center, and, with long knives, cut the honey out, in as far as they can reach; then go to the other end and go through the same process, not being very particular whether they get all honey or part pollen; and if there are a few sheets of brood mixed in, it does not hurt. The whole mass is mashed up together, and the honey strained out, and the rest made into wax. They tell us, that during this December, or winter flow, they cut the honey out as often as every 15 days, and, of course, the bees have the comb to build anew every time, and they get as high as 15 gallons (every thing here being reckoned by the gallon). If you wanted to buy feathers for a pillow, you would have to buy them by the gallon; if you want a turkey for Christmas, or a roasted swine for the Fourth of July, it's all by the gallon.

A. W. OSBURN.

San Miguel de Jaruco, Cuba, W. I.

Thanks for the interesting facts you give us, friend O. We are very glad indeed to know that energy and enterprise are to be brought to bear in developing this land of sunshine and flowers.

REGARDING THE REPORT OF THE TORONTO CONVENTION.

FRIEND MUTH OFFERS SOME SUGGESTIONS IN REGARD TO THE MATTER.

FRIEND ROOT:—Unable to read for some time, I just had read to me the article of March 19, 1884, of A. B. J., headed, "The Vice-Presidents of the National Convention." There appears to be something wrong, which should be corrected without delay.

When at the convention at Toronto, I was under the impression, and some one told me, that the stenographer was employed by some journal, and we could get from him the report of our meeting for \$100, which seemed, to some of our friends, an extravagant charge. Not having charge of the matter, I dropped it and heard nothing of it until by the above-named article. I had not supposed that anybody had been hurt, and was only sorry that our members should do without the report of the convention. I had stated to our friends the amount of money in the treasury at the time. The amount now is \$137.65—ample means to defray the expenses. Having been asked by very many friends for the report of the convention, and feeling safe in saying that it will yet be a matter of great interest to all, I for one am in favor of having the report of our National Convention at Toronto printed in pamphlet form, and a copy presented to every member of the association, as we agreed at the convention. This you will please communicate to the ex-President,

brother Jones, and to the members of our association. If agreeable, let the proper party procure the report, and draw on me for the money. It behooves you, perhaps, best, as the Secretary of the meeting, to print the pamphlets and mail one to every member, of which there are 105, according to my list. The treasurer is solvent. Our convention at Toronto was a pleasant affair to every participant, and its memory should not be stained by unpleasant recollections. If some of our members have not adhered strictly to the rules of business, they were only guilty of omissions which were unintentional. Every member present had the honest intention of contributing his mite toward the success of the meeting to the best of my observation and judgment.

Hoping that all will be arranged with a feeling of brotherly love, and satisfactory to all, I am very truly yours,—

CHAS. F. MUTH.

Cincinnati, O., April 12, 1884.

There, friend M., that sounds just like you, and, in fact, it sounds just like the spirit of the convention. I did not hear an unkind nor an unfriendly word spoken of anybody while in Toronto, and it has seemed to me a little sad that there should any unpleasantness occur after it was all over. I know I was put in as secretary, but I told them beforehand that I wouldn't make a good one. I did not arrive until the meeting was well under way; and as the reporters had hold of the whole matter, I let it rest in their hands, aside from the brief sketch I gave of the proceedings. Like yourself, I expected, too, the fullest report we had ever had of any convention. In regard to printing the pamphlets, it seems to me it would be far better to let Bro. Jones have it done in Toronto, especially as it would be quite necessary for himself, or some of his men having the matter in charge, to review the report and cross out unimportant matters. It seems to me the reporter was to take down every thing that was talked about—good, bad, and indifferent. I agree with you, friend M., that the better way would be to hand over the \$100 and have the report written out and printed in good shape. If the funds of the convention are lacking, several of us can "chip in" and make it up. I for one would like to help. Your concluding sentence is exactly what we want—all of us, I think.

REVERSIBLE FRAMES.

A REPLY TO THE CRITICS AND THEIR OBJECTIONS.

HAVING been greatly amused by reading the very energetic protests against reversible frames being allowed to enter into a bee-keeper's stock of implements, as though the very thought of such a departure from the "beaten track" is dreadful to contemplate, I have concluded to say a few words on the subject. Friend Fradenburg, even, desires that "all bee-keepers be earnestly advised *not* to adopt any of them at present, but have a committee appointed," to act as guardians of the poor, simple, gullible bee-keepers' interests; and "ye editor" indorses the suggestion. Easy! easy, gentlemen! Nobody is going to *compel* you to use reversible frames, if you do not wish to. When I discovered what I considered a remedy for the several disadvantages enumerated by Mr. Heddon in

his article in April GLEANINGS, page 232, I innocently thought that making the discovery public was doing a little toward paying the debt I owed to previous discoverers, and that others would be glad to reap the benefits of the practice. From the flood of inquiries received since my article in GLEANINGS for March appeared, I feel sure I was *not* mistaken in thinking such a device was called for. That it will do what I claimed for it in the article alluded to, let the testimony of the critics themselves answer.

J. A. Buchanan, on page 224, April number, says, "The combs were all built up solid inside the frame, and well fastened. * * * By this process" (reversing the frames) "it is an easy matter to get all your combs attached to all parts of the frame." Further along he says: "True, all the honey, or almost all, could be forced into the surplus boxes." But he objects to having the honey so "forced," for fear the bees will be short of "winter stores," and will require feeding. "That," he says, "is too much work, and will pay no man."

James Heddon, in GLEANINGS for March, 1881, page 116, says: "I delight in light hives in the fall. When the cause of it is, that the bees put too much above, then I will make up the deficit with properly prepared sugar syrup." This state of things he obtains by using eight instead of ten frames.

W. Z. Hutchinson, in his last article, indorses this practice, which he designates as the "squeezing process."

G. M. Doolittle, in GLEANINGS for May, 1881, page 233, says: "If we wish a good yield of box honey, use so few frames in the hive that the queen keeps them literally full of brood."

I think this testimony would effectually answer the above objection to the reversing process, did such objection really exist; but the fact is, the reversing process, properly managed, will, to a great extent, prevent the need of feeding for winter stores, as the apiarist can allow the bees to fill the extra combs at any time when he thinks advisable, and still allow the queen sufficient room for egg-laying. Remember, we can and should use more combs when we practice reversing to secure comb honey in sections. This I consider an important point, which should not be lost sight of, in estimating the advantage or disadvantage of this method.

Friend Fradenburg's principal objection appears to be, that using reversible frames will somehow "knock the bottom" out of the "universal frame," or, as he puts it, "It will be like the confounding of the languages." What the using of a reversing device has to do with the size or shape of frames, or why it should prevent any one from using the size that best suits him, any more than using Root's metal corners would, is something I can not understand. My device gives the same metal bearings as does his; can be used with metal rabbets, or without; requires no change in the make of hives, but will fit where any L. style of frame will; can be used interchangeably with any other L.-shape frame; need not be reversed if not desired; needs no "nails nor wires" as "spacers," which friend Heddon objects to, and has the same "lateral movement" as the Langstroth, which he considers, and so do I, indispensable. Friend Heddon says, "The drawbacks to the reversible-frame method are greater than all the advantages;" but he fails to tell us what those drawbacks are. Instead, he "supposes a case" of the invention of an "extended top-bar," and says: "Looked at in this light, we discover the inferiority

of reversible frames, except for reversing." Wherein it is "inferior," he fails to explain.

But Mr. Heddon has a "better and cheaper way" (what is the use of it, if reversing is of no benefit?) that completely solves all the difficulties. Let us see what it is. "Reverse the whole hive at one movement." This would be on a par with advising one who wished to relieve the queen from crowding, to extract the whole hive at one movement. Friend Heddon, you must have been poking fun at Mr. Baldrige and myself when you wrote that. You are too experienced an apiarist to give such advice seriously.

Judging from Mr. Roof's comments on this plan, page 224, April GLEANINGS, I think he fails to catch all the advantages proposed by reversing the frames, only one of which, getting the combs built solid, would be secured by "reversing the whole hive," to say nothing of its disadvantages, and the difficulty of its successful execution. C. J. F. HOWES.

Adrian, Mich., April 2, 1884.

Well, friend H., you have made a pretty able defense, but I am afraid I shall have to be accused of "reversing" some of your ideas as well as frames, when I tell you that the most practical reversible frame that has ever come to my knowledge is the one mentioned in one of our editorial pages. If it works as well in our apiary as it seems to me that it will, I think it is destined to do considerable "reversing" before we get through with it. We are having engravings now prepared to illustrate the frame and hive in our next issue.

SMALL COLONIES.

FRIEND HEDDON SPEAKS A LITTLE IN THEIR DEFENSE.

THOSE who have read the leading works on apiculture have been taught, that the golden rule of bee-keeping is to "keep your stocks strong." Now if that means, keep a large number of individual bees in each colony, I object to the rule. If it means keep a large number of bees according to the size of the brood-nest, I agree with it. At the same time, however, I can not then agree that we must have large numbers of bees in a hive, in order to get a large pro-rata yield of honey. I mean pro-rata to the number of bees. Let me explain by relating practical experience.

Nearly every spring we have two, three, or four colonies, and sometimes more that are weak in numbers; that is, weak according to the capacity of our standard L. 8-frame hive. I will now tell you how I manage such colonies, to avoid any loss by their being weak, and try to show you the mistake in Bro. Doolittle's argument, on page 236, top of second column.

Let us suppose we have a queen, two frames of brood, and about three pints of bees when the honey-harvest opens, in our hives, with 8 combs, to constitute our weak colony. Now by its side we have a strong one with brood in 7 combs, and usually 8, with the hive full of bees. Now, is the strong colony, which has about four times the brood and bees of the other, going to be any more profitable, according to its size, than the weak one? Let us see.

Now for the management. Let us suppose we are going to run for extracted honey. The first thing we must do is to put a super of empty combs, and in

a few days another, and perhaps soon after a third one, on our strong colony, when we have a 4-story hive, raising ripe extracted honey on the plan given in Dadant's little book. Now let us return to the weak colony. We find it with about the same number of combs for surplus honey, according to its capacity, all in one story, working on the side-storing principle, *a la* Adair, Gallup, Poppleton, and others. This little colony has brood to care for only in proportion to its size, and they gather honey from the fields, and store it for us, and make a draft upon the resources of our field, and upon our capital in wood and combs, in proportion to the capacity of the entire stand. This we know to be true by an experience of 12 years.

I remember well at one of our State Conventions, when I related similarly to one of this State's brightest bee-keepers, asking him how this coincided with the golden rule of bee-keeping. He replied that he had, for several years, worked in the same way with great satisfaction. The reader will notice that this system is adapted to an apiary equaling the capacity of the field which surrounds it.

MOTH WORMS AND POLLEN.

Bro. Vandervort, who has just paid us a visit, is a man of over 20 years' experience, and born with the faculty of close and careful observation, and he says that moths will never breed in combs that contain no bee-bread, and an able writer confirms that theory, and I can not remember of any ease to disprove it; and may it not be that Bro. Doolittle's system of partially storing comb honey in the brood-chamber has caused him to have so much to say in regard to preventing the ravages of the moth larvæ?

Dowagiac, Mich., April, 1884. JAMES HEDDON.

I am aware, friend H., that several have taken the ground that you take; but I could never really understand how they did it. Powerful colonies have always been most profitable for us; and I do not know that I am aware of any exception to this. On one occasion we had a hybrid queen that filled her hive so full they were almost ready to swarm before the fruit-bloom opened. This colony gave us enough so that we extracted quite a surplus from the fruit-bloom, while all the rest of our apiary gathered only about what they needed to rear brood. At another time, another powerful colony in early spring gave quite a yield of honey, and furnished four good natural swarms, all of them furnishing more or less surplus. This colony was worth to us in clear profit three or four of the rest. Quite a number of the friends have doubled up, in preparing bees in the spring, in order to get all booming before the harvest came, and then gave us astounding reports. In the illustration you cite, I should say that a strong colony would get by far the most honey in proportion to the number of bees it contained. Where they get the swarming mania, and loaf around, and won't work, we have a serious drawback, I know; for a weak colony that keeps right on storing honey, without a disposition to swarm, might go far ahead of a powerful one that would not work.—I entirely agree with Bro. Vandervort in regard to the pollen business; but it never before occurred to me why it was that friend Doolittle was troubled with moth worms when the rest of us did not find any.

HOW MUCH DOES A POUND OF HONEY COST?

FRIEND DOOLITTLE GIVES US "FAX AN' FIGGERS."

ON page 95 of GLEANINGS, present volume, Mr. H. White writes: "Don't we say too much about getting a big price for our honey? Would it not be better to try to raise it so we can afford to sell it cheaper? It does not seem to me it will ever become the staple article we wish, unless we can sell very cheap." On the same page, replying to the above, our worthy editor says: "I agree with you in regard to furnishing honey at a low price, and have felt quite a degree of pleasure in furnishing honey for only 10 cts., in 50-lb. cans."

From the above it would look as if we bee-keepers were asking an exorbitant price for our product, and getting rich out of the sales of honey from our apiaries, thus hindering the rank and file of the people from consuming our honey, by the high prices we ask for it? But, wait a moment. Another worthy editor speaks from page 181, of the *Amer. Apiculturist* for 1883, and says: "After paying the supplier's bills, the current expenses of the apiary, the cost of shipping the honey, and the demands of those who sell the honey for the bee-keepers, there is but a small amount left for their own remuneration for their hard season's work, and the interest on the capital invested. Do we state the facts in the case? It may be pleasing to listen to the reports of large crops of honey; but when we sit down and carefully estimate how many pounds of extracted or comb honey must be taken from an apiary of 100 colonies to pay the expenses, and give the apiarist fair compensation for his time and investment, a great deal of the beauty of the picture is spoiled."

Again, W. E. Clark, President of the N. E. B.-K. Convention, says in his address to that convention in 1884: "The bee-keeper's calling is one of sweat and toil; every dollar that the bee-keeper gets is well earned." Mr. Clark is a thoroughly practical man, and any one who has read any of his writings can not help but feel that his statements are practical and truthful.

Now, from the above and other similar expressions which I have read, I can not but conclude that we are not thoroughly posted regarding what 1 lb. of honey costs us to produce the same; and the object of this article is to show, as nearly as may be, what the actual cost of 1 lb. of honey is.

P. H. Elwood, who is one of the largest honey-producers of this State, once said to me that any man who could successfully manage an apiary of 100 colonies of bees, spring count, would command a salary of \$1000 in any business he might see fit to engage in. This statement of friend E. I believe to be near the truth, after a careful comparison of men, and salaries obtained by different persons, during the past few years; but in order not to be considered extravagant, I shall reduce it one-half, and allow \$500 as the necessary amount to pay a man competent to successfully manage an apiary of 100 colonies of bees. Then we have a capital of \$600 invested in bees, calling each colony worth \$6.00, which would give \$36.00 in interest to be added to the \$500, calling the interest at 6 per cent, and \$4.00 as taxes, where our bees are assessed at \$5.00 per colony, as mine are. Then we have \$200 invested in hives and fixtures, which, in order to keep good, and renew them when necessary, will require double interest at least, or 12 per cent, which gives \$24.00 more. Then

we must buy or make 5000 sections = \$25; 200 shipping-cases and glass for the same, costing \$40, and 50 lbs. thin foundation for sections, amounting to \$30, at 60 c. per lb. To this we must add cartage of our honey to the nearest city or railroad, costing me \$11.00, and the rent of a shop and grounds for our apiary, costing \$30 more, so that we have \$700 as the total cost of the working of our apiary of 100 colonies of bees. If we own the shop and land which is required for our apiary, the cost to us will be as great to pay the interest and taxes, keeping it in repair, etc., as the rent would be were we to hire the same. Because a man owns a thing does not make it cost him any the less, even if it does make him feel more independent. Many seem to suppose that when they own a thing, the use of it does not cost them any thing; but often a few years will prove that the use of it would have cost them less had they rented it. Thus we have \$700 as the actual cost of what honey our 100 colonies of bees may produce us. The next thing is, to ascertain how much honey we can expect year after year from them.

As the honey-production of our country has been of great interest to me, I have carefully noted all convention reports, and also all reports given by practical and successful apiarists, and I find that the average yield of honey, year after year, reported by this class of individuals, in the United States, is not far from 50 lbs. of comb honey. Into this estimate I have not taken those who keep from 3 to 5 colonies of bees, and "gush over" with a report of from 200 to 300 lbs. of honey per colony, nor, on the other hand, those who have made an entire failure of keeping the same number of colonies. Such as these do not come under the head of successful apiarists, capable of caring for 100 colonies of bees. Thus we have 5000 lbs. of comb honey as the equivalent of our \$700, taking the years as they average throughout the U. S. Now by dividing the \$700 by the 5000 lbs., we shall have the cost of 1 lb., which proves to be 14 cts.; so that, if the comb honey of the U. S. nets the producers less than 14 cts. per lb., we are keeping bees at a loss; and if more, we are making our avocation profitable.

The same holds good regarding extracted honey. The case is the same, with the exception that, perhaps, the packages both for storing and shipping cost a little less. From a careful account kept with my own bees, and a summarizing of reports, I believe that about $\frac{1}{2}$ more extracted honey can be obtained from the same apiary than comb, which gives us 7500 lbs. as the product of our 100 colonies. The cost (\$700) divided by this gives us 9 $\frac{1}{2}$ cts. as the cost of one pound of extracted honey. By allowing the $\frac{1}{2}$ cent as saved on the cost of packages over comb honey, we have 9 cts. as the actual cost of 1 lb. of extracted honey throughout the U. S. In this, Mr. T. W. Fleming (page 99) will find an answer to his questions regarding the profitableness of extracted honey compared with comb honey.

Now, having the above before us, I wish to say to friend White, that if, in order to have honey "become the staple article we wish," it must go lower than 9 cts. per lb. for extracted, or 14 cts. for comb. It is very poor policy for us to wish for a staple article; for of what object would a staple article be, when we could not live at the price paid for the production of it?

To friend Root I wish to say, that I feel no "degree of pleasure" at having him sell a product of mine so

low that he can not afford to pay me for the same what it actually costs me. By page 212, GLEANINGS, I see he pays 8 cts. per lb. for a nice article of extracted honey delivered at Medina, which he sells, I suppose, at 10 cts. To deliver this honey in Medina would cost me 1 ct. per lb., or nearly so, so that 7 cts. is all I would have left for what actually cost me 9 cts. Thus if I were obliged to sell my whole crop at these figures, I should have my whole salary cut down to \$350 a year, as the other costs for production can not be reduced. Worse still. I have just got returns for a small lot of extracted honey sent to New York, which nets me only 6 cts. per lb., so my wages must still come down to \$275 per year. I believe I am entitled to as good pay, after spending years of toil and study, sleepless nights in planning and framing ideas to be carried out in the apiary, and days of hard work in the hot sun in carrying out these plans, as are our lawyers, doctors, and clergymen, who sit in their easy-chairs in cool and shady offices, and have given no more time and study in preparing themselves for their avocation than I have. And yet I am called to come down to a tithe of their income, in order to have honey become a "staple article."

I here leave the subject by asking if our low prices and dull markets do not denote that the production of honey is being overdone; in other words, is not the supply more than adequate for the demand, at living prices?

In the above I said nothing in regard to the rate of increase, for at the low price (\$6.00) I placed the bees, the hives, combs, and 30 lbs. of honey in the fall, are worth the \$6.00, so that the increase might as well be destroyed, as sold at these figures.

Borodino, N. Y., April, 1884. G. M. DOOLITTLE.

Friend D., you have given us a grand article, and I do not know of any thing we wanted any more than just such an article at this time. The summing-up of it would be, if I am correct, that we may conclude, as a general thing, comb honey is worth 14 cts. per lb., and extracted honey, 9 cts. per lb. If we can make sales so as to make more than that, we are making a profit on our honey accordingly. Your figures are fair, and, so far as I can see, just about where they ought to be. I presume, of course, some of the friends have divined that I have something to add, however, and something to bring up which it seems to me you have omitted.

Elwood thinks a man who can successfully manage 100 colonies of bees would command a salary of \$1000 in any other business he might see fit to engage in. While this, perhaps, is largely true, I think there are some great exceptions. We have people who will manage 100 colonies of bees pretty well, because they love the bees. We frequently find eccentric school-children who excel in mathematics or spelling, or some other branch, who would not excel in other things. Again, there are many so situated that they could not go away to command a salary, but could take care of bees at home very well. A good many women are making nice incomes with bees, who could not work for a salary — Mrs. Axtell, for instance, our good friend Mrs. Harrison, and others.

I do not quite like the way in which you pass over our small friends who, as you say,

keep from three to five colonies, and get from 200 to 300 lbs. of honey per colony. What do you say "gush over" for? Are they not doing well, and are we not proud of them? Why, I just enjoy visiting a bee-keeper who has live colonies, and has secured 1000 lbs. of nice extracted honey from the five. If you look through Reports Encouraging, you will find there is quite a big lot of this class also. And, by the way, do they not get their honey cheaper than the proprietors of 100 colonies? How about the specialist just here? Another thing: If we sell our honey for more than 9 or 14 cents, we make a profit; and if we make our whole apiary average more than 50 lbs. per colony, we also make a profit. In fact, we stand a chance of making two profits, for our honey wouldn't then cost us 9 and 14 cents. Besides, friend D., I know some people who would be quite happy if they didn't make over one-half of \$500.00 a year. Not only is there a steady stream of applications at our factory for something to do, but men and boys are making journeys to Medina, in the hope of getting a situation, and hundreds would gladly go to work for \$1.25 per day. You may say they are not worth any more. Well, as a rule I think that is true; but what shall our friends do, whose market value is only about \$1.25 a day?

Then there is another side still you have not looked at. Hundreds and thousands are spending their lives without making even a dollar a day. In fact, they are more in debt at the end of the year than they were at its commencement. They might have kept bees when they would otherwise have done nothing; and the expense of getting a start is very little where one is determined that the bees shall pay their way. Very likely, friend D., you can not afford to produce honey at 8 cents per pound — that is, unless you have some other business that yields you an income. If I am correct, you have some other business, and I think it is very wise in you to do so. I think a greater part of our bee-keepers should have something besides bees to depend on. A farmer who raises one crop, or any individual who depends upon one single source of income, is very apt to be disappointed. I would have a garden and some poultry, and small fruits; and whenever any of these sources of income should for some reason become unprofitable, I would amass my energies and zeal on the other lines where there was a good demand. This is simply my advice and suggestion. Others may do as they choose.

Bee-keepers sometimes have hard times to make both ends meet. Sometimes a whole season's work has been a losing business. Is it not often so with farmers and grocers, and even the lawyers and doctors and clergymen? Do they *all* sit in "easy-chairs" in "shady offices"? I know quite a lot of them who do not; and if I am correct, there are about as many doctors and lawyers who do not get \$500 a year as there are bee-keepers. In regard to the clergymen, I was thinking a few days ago, and thinking of it a little sadly, that there are so many of whom it can be truthfully said, "That man used to

preach once." Why don't they preach now? I have wondered if it were not because they loved "easy-chairs" and "shady-offices," better than they loved the earnest, honest work of saving souls, especially when the souls to be saved were away down in the social scale, and where it was hard and disagreeable work to go after them and hunt them out and lift them up.

Our market reports in the different journals show that there is a good deal of honey sold for less than 8 cts., and I have a good many times thought I was doing some of the friends a favor by taking their honey off their hands in *ton lots*, even though I gave them only 8 cts. for nice honey. If they didn't make it pay to produce it at 8 cts., I presume likely they won't raise any more, and pretty soon there won't be any in the market. You know what was said a year or two ago about raising queens for a dollar. The traffic now in queens at a dollar amounts to thousands of dollars annually; and those who raise them in large numbers at this price seem to be happy and contented in the business, although they may not be getting rich very fast. Scarcely a day passes but that a brother or sister writes, begging to be allowed to send me queens as fast as they can be got to laying. Although I take a great number of them, I do not dare to take a fourth part of what are offered.

HIVES FOR TRANSPORTING BEES.

Taking Advantage of the Basswood Bloom.

HOW SHALL WE CONTRIVE TO GET THEM LIGHT, WELL VENTILATED, AND SUBSTANTIAL?

THERE is a slight mistake in my article on page 236, in regard to the Simplicity cover, to make so as to serve a double purpose. You let me say, "Take a Simplicity cover, have a tin top instead of the broad board. After nailing the rim together, put on the tin in such a way that it can be taken off without much trouble. This will be a cover for ventilation when the tin is off, and a tight cover when the tin is on."

Well, friend Root, I do not know what you think of this new way of ventilating bee-hives, I think, that for ventilation it is a "boss" arrangement; but the opening is rather large to make it bee-tight at the same time. I wanted to say, tack on a piece of wire cloth first (and leave it on permanently); this, if stretched well, will be a support for the tin; if made in this way it will serve the double purpose of a tight cover; and also, when the tin is removed, will be a good cover for admitting air.

Marietta, O., April 8, 1884.

R. STEHLE.

I caught your idea, any way, friend S., and it is certainly a very ingenious one. We are talking now about fixing hives especially prepared for this purpose. The only difficulty I see with the wire-cloth top with a tin cover to slip over it is, that some tired individual might sit down on these covered hives; and if he were very heavy he might go right through the tin, wire cloth, combs, and all. Hives for transportation shouldn't weigh an ounce more than what is absolutely necessary, yet they should be strong enough to stand handling, even when they

are loaded with honey. For confining bees for shipment during hot weather, there is nothing like a sheet of wire cloth over the whole top; and for a powerful colony it ought to be over the whole bottom as well, or pretty nearly that. We can fix it nicely with the removable painted tin covers, and we would have these tin covers wired at the edge like dripping-pans, so they would nest into each other, for convenient form for shipment. But how about the sitting down on them? I have just made arrangements for importing some tin, manufactured to an exact size for this purpose. I hope we shall be able to get the expense down to an even 10 cents each for the dripping-pan covers. Wire cloth is now so cheap (only 2½c per sq. ft. in quantities) that this will be only a small item. Now, how shall we get a very strong hive made out of stuff, say ½ or ¼ in. thick? Of course, such hives would not be used for wintering bees, unless it were for cellar wintering.

WHERE OUR BEES HAVE DIED, HOW SHALL WE GET OUR HIVES FILLED AGAIN?

ALSO SOMETHING ABOUT SELLING AND BUYING BEES BY THE POUND.

THERE has been a great loss in bees this past winter, and the principal conversation among bee-keepers is, "How shall we re-stock our hives? Shall we pay from 8 to 10 dollars for colonies with one or two lbs. of bees and a queen, with empty frames, and most likely with frames that will not fit our hives, and, consequently, will have to be transferred to frames of our own size?" Another says, as we can not get good strong colonies (only 8-frame nuclei) can we not purchase bees by the pound, and queens according, and thus not be cheated? and as we have got a plenty of combs and hives, not spend our money for what we do not want.

Will you please tell us about handling bees by the pound? Can they be sent long distances successfully? If so, we will most certainly buy our bees by the pound.

Another subject I wish to speak of. I see by GLEANINGS there is a strong talk of sending bees north for the basswood honey-flow. I would say, the county I reside in corners on the one that George Hilton lives in, and that our honey resources are remarkable. First, we have the usual willow, tag alder, and other pollen-bearing trees and shrubs; we also have the apple and other fruits, white clover, and on every side of my location the basswood-tree abounds as far as anyone has thought that bees fly as depicted in GLEANINGS, except on one side, where the forest extends only about one mile and a half, where has once been a very dense forest of pine timber, which has been removed for several years. Fire has swept through, cleaning the ground nearly fit for cultivation; the soil being rich and moist, white clover, red and black raspberries, also blackberries, grow in profusion. Fireweeds also grow very rank, and yield a vast amount of honey. Now I would say to the bee-keeping friends, 1000 colonies would not overstock my place in basswood time; and if any one has more bees than he can well manage, I should be glad to take 100 or more colonies off his hands for a share of the honey. I

will pay freight one way, re-ship the 15th of Sept., with combs filled with honey for winter use, if desired, and give the owner all the honey obtained from the basswood flow, what swarms issue to belong to me, the honey to be extracted. I should prefer the L. frame, but do not care what strain or race the bees belong to.

S. J. YOUNGMAN.

Cato, Mich., April 10, 1884.

Friend Y., we do not have a bit of trouble in shipping bees by the pound, even to Texas, Florida, and other remote points. We do it, too, with nothing but the Good candy—that is, honey and pulverized sugar. It seems to me by all means the best way of buying bees, especially if your frames are odd-sized. The express charge on nothing but the bees and a light wire-cloth cage is very much less than on a hive and heavy combs, or even a nucleus. I do not believe, however, it would be the best way to ship bees to take advantage of the basswood-bloom, unless the one who receives them has plenty of empty combs to put them on. In that case they would be all right. It just now strikes me, that wired combs of fdn. would be very nice on which to ship bees to catch a honey-flow. They are very light, very strong, and a case to hold say three or four of them might be made so as to weigh but little. If bees are to be shipped to meet these honey-flows, it is going to be a problem to devise light packages to save express charges. Your plan of having bees sent you, to be sent back after the honey-flow, I do not quite like, because it leaves the way open for so much misunderstanding and dissatisfaction. I think I should rather buy or sell right out, for a fixed price, and have it done with. Taking bees on shares, or any sort of a company business, does not seem to turn out very well, so many unexpected things come up.

A PROFFER OF HELP.

QUESTIONS ANSWERED FREE OF CHARGE.

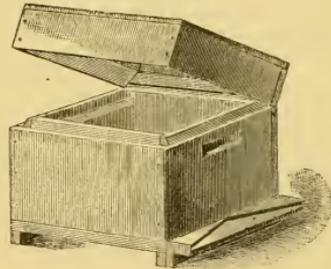

I WISH you would send me those letters from beginners to answer, page 245. I feel sorry for beginners, and would like to help them by telling them "how not to do it." I will not charge any thing, but must be furnished with stationery and stamps. I love to write letters and give people advice. I make this offer on trial, and if I get more on my hands than I can attend to, I will beg you to stop sending them. I ought to see a copy of your A B C book, so that I can conscientiously recommend it, if I think it good, and I believe it is, from the reports I see in GLEANINGS concerning it. I believe I know all that any beginner need know about bees, and I like to tell it. I sold a swarm of Italians last Monday to a woman, and after telling her how to do when they swarm, I gave her two copies of GLEANINGS, and she seemed surprised that there should be papers devoted exclusively to bee culture. And when I began bee-work, fourteen years ago, I did not know there was such a paper in the world. I had the bee fever in its worst form, and I wanted to ask hundreds of questions, and there was no one to answer me. I am in favor of a standard hive. Will it be the Simplicity? Two days ago I sent to you for

ten; and if I like them, I will say so in every letter, if not, not.

MAHALA B. CHADDOCK.

Vermont, Fulton Co., Ill., April 8, 1884.

I am sure I am very much obliged to you, my good friend, for your kind offer; but I am almost afraid that the friends who write me such long letters will hardly feel acquainted with you as they do with me, and may be they wouldn't feel satisfied with your answers, as you might feel inclined to give them. I think the better way will be for them to write directly to you, and you can reply. We send the copy of the A B C book, so that you may be well posted in regard to the questions they will be likely to ask. I am very glad you are in favor of a standard hive, and it seems to me the Simplicity bids fair to become a standard—or, at least, to a great extent; for almost all hive manufacturers are now furnishing either the Simplicity hive, or a hive on the general plan of the Simplicity, but perhaps with some of their own modifications. Even our friends who have so long adhered to the closed-end Quinby frame are now, at least some of them, adopting a hive that is, so far as dimensions are concerned, externally and internally, the Simplicity exactly. The hive noticed in this number, from O. J. Hetherington, illustrates the point. Below we give a picture of the Simplicity hive as it is made by friend Viallon, Bayou Goula, La.:

SIMPLICITY HIVE AS MADE BY FRIEND VIALLON.

Our friends will notice that friend V. makes a bottom-board different from the cover; that is, it has only cleats on it, back and front. My objection to this is, that in our locality it leaves an opening for toads to get under, and we do not want any such chaps under our hives. If we close up this opening we shall have a bottom so near like a cover that I have thought it best to make them exactly alike, so they may be interchangeable. Aside from the bottom-board, the bevel to exclude rain, on the upper edge of the hive, is a little different from ours. The front and back are just as we make them, but the sides are rabbeted, instead of beveled. The question has frequently been asked me why I don't have the Simplicity covers and upper stories sit on to each other with a plain rabbet, as box covers are often made. My objection to this in place of the bevel is that there would then be a chance for them to stick together; whereas, with our arrangement there can be no sticking, even if there should be some variation in hives and covers.

Heads of Brain, From Different Fields.

SOME SUGGESTIONS IN REGARD TO MAKING FDN.

I AM using one of your 6-inch mills, and it is just going nicely. I had trouble at first, as the rolls were rough; but now it goes well. I am using the original 9-inch mill I got of you some time ago; have not had any complaint about the bees not working it out. I have about 1000 combs of fdn. built out from it, and perfect. I use a table to the 9-inch; lay a sheet on straight, and it goes through straight. I have not had to adjust the rolls for a long time. They are *always* ready. I dip the thin edge in cool water before entering between the rolls, and they don't stick. I use soap root boiled down, then thinned about as I think right, and I have no sticking to the rolls. The *secret* is, that I fit a piece of wood $\frac{3}{4}$ inch over the top roll, whole length, with pieces of sponge so fastened that they brush the upper roll, and take the moisture, and hold it so the top roll is always wet. Could you incorporate a long brush instead of the sponge, to bear on the top of the top roll, to take the water and hold it to keep the top roll always wet? The trouble has generally been with me, with the top roll. It would get dry before the sheet was through. I use an easel for holding two sheets near the stove, on an incline, thick end down, and nearest to the stove. It will soften fast enough to make lively work for two to run the mill. I put on a dozen or two sheets at a time, and a good heat, especially if the weather is cool. The dipping-boilers don't need divisions. I took mine out. The bottom of the boilers should be smaller than the top, so that, when through dipping, we can place the boiler on the stove to heat the wax, then let it cool; and when cool, take it out and remove any sediment at the bottom. A little hot water at the bottom of the dipping-boiler prevents *caling* at the bottom, and keeps wax in condition for dipping longer.

Wax is high and scarce. I paid 27½ and 30 cts. in San Francisco.

More rain; ground soaked; bees swarming.

Napa City, Cal., Apr. 12, 1884. J. D. ENAS.

Friend E. uses the soap root, which is natural to his region. We have used soap bark and a great many other lubricators, but now prefer common starch. Very likely a row of sponges, or a brush along the top roll, to keep it lubricated, would be a good idea. The suggestions in regard to having the dipping-tanks made tapering may be a good one; but we always pour out the wax, instead of allowing it to cool in these tanks.—The objection to putting in thumb-screws to adjust the thickness of the fdn. is, that the hands would be all the time turning them.—Friend E., we think you very fortunate indeed if you can get wax from 27½ to 30 cts. We are glad to get it for 33 cash or 35 trade; and for very nice clear cakes of bright yellow, we would pay 35 cts. cash.

REVERSIBLE FRAMES; DOES FDN. PAY IN BROOD-FRAMES?

I still think the best reversing device is like the sample I sent you some time ago, to slip on top and bottom bar like a lid on a Peet cage. But after be-

ing said what there has been, I have decided to wait till the problem is better solved. However, I am satisfied a reversible frame has decided advantages for raising comb honey. I should like to know how you turn a Simplicity hive over, without letting the rain run in at the bevels. I turned one over and cut grooves in the lower ends; fastened frames in; turned back and put a crate on top of bottom-bars, and it worked well enough; but I fear it is getting to be too much fixing, and perhaps the reversing devices are too. However, it is a good way in having foundation built out. And, by the way, how is it that, while we are fussing with fdn., feeders, etc., there are those who use them little, and certainly their reports year after year show that they are making their business pay? G. M. Doolittle says he has never used 10 lbs. of fdn. in brood-frames.

Marshallville, O., April 11. C. WECKESSER.

It is true, friend W., that if you turn a Simplicity hive over, the rain will run in at the joints; but for that matter, a great many use hives tiered up one above another, sitting squarely on each other without any bevels at all to keep the water out. If friend Doolittle says he has never used 10 lbs. of fdn. in brood-frames, I should say that he has never accomplished nearly what he might do. Perhaps it may be explained in this way: That he has plenty of nice brood-combs from year to year, and therefore has no occasion to have new ones built. He does not sell bees, as we do, you know. If friend D. were commencing with half a dozen colonies, and wished to build up to 100 or more, my opinion is, that he could afford to use fdn. for brood-apartments, even if it cost him \$2.00 per lb. Of course, he or any one else has a right to a different opinion, if he chooses.

HONEY-DEW FROM PEACH-LEAVES.

April 4th my bees worked on the young peach limbs and leaves; again on the 9th; the day was cloudy, with gentle north wind. The bees worked very busily all day on peach-leaves, almost neglecting black and red haw, both of which are now in full bloom, and not far away. Was it honey-dew? I never saw the like before. Last year I took lessons in bee-keeping from your old friend Daniel Kepler.

ARCH. A. MOORE.

Hubbard City, Texas, April 11, 1884.

I suppose it was honey-dew, friend M. Did you look carefully to see if there were any aphides on or about the leaves? If there were none, we shall have to conclude it was an exudation of another kind, from the leaf itself.

GRANULATED SUGAR FOR FEEDING BEES.

On page 140 I see you recommend granulated sugar for feeding. If it is intended to be stirred into honey, for any benefit it will be to the bees, from experience I would as soon have so much sand. The sugar will not dissolve, and will be found at the bottom of the hive.

W. P. TAYLOR.

Fitzroy Harbor, Oat., Can., Feb. 26, 1884.

Friend T., are you not a little positive in your remarks? I know that bees do sometimes lick out the honey, and let the sugar crumble to the bottom; but this has been the exception rather than the rule with us, and we have used it largely. Perhaps you are not aware that bees will often sub-

sist on granulated sugar alone, without any water or any thing else; and after it has rattled to the bottom of the hive they will sometimes lick it up. You can satisfy yourself of this by confining the bees to their hives, so they can not carry it away, and you can also watch a bee while he eats up a dry grain of sugar. Of course, some water in a sponge near by greatly facilitates the progress of working up dry sugar; but it is rather late in the day to declare that it is worth no more than so much sand.

FRIEND DUFF'S EXTRAVAGANT STATEMENTS IN HIS CIRCULAR.

I forgot to add in my circular, that those reports of 300, 400, 500, and 1000 lbs. I found in GLEANINGS IN BEE CULTURE, edited by A. I. Root, of Medina, Ohio. I had "orter" give my authority, I "spect."

Flat Ridge, Ohio, March 6, 1884. A. H. DUFF.

Perhaps so, friend D.; but the statements in GLEANINGS were not intended to convey the idea that anyone could do it any season. They were simply reports indicating what a powerful colony of bees might do under extremely favorable circumstances, with a heavy flow of honey. Very likely GLEANINGS should give reports with more qualification and explanation than it has done, and perhaps we had better be a little more careful in this line *all around*.

TALKING TO SOME PURPOSE.

I have earned a dollar in getting the few subscribers I have. If there is any value in talk, perhaps I talked too much; but I don't know; not much used to the business of canvassing for papers. But I made quite a long speech the other day before the officers of the County Agricultural Society, to get the premium raised on honey. The premium has been \$1.00 for best, 50 cents for second. I got it raised to \$5.00 for first on comb honey, \$3.00 for second, and \$2.00 for third; the same on extracted. That speech enabled me to get one subscriber for GLEANINGS. E. C. HUBBARD.

Water Valley, N. Y., April 11, 1884.

Well, friend H., if you got the premiums raised from 50 cents and a dollar up to two, three, and five dollars, I should think that your talking amounted to something, any way. Perhaps it is a good suggestion to a good many of us, to look after this matter of fairs and premiums.

ITALIAN BEES IN MANITOBA.

From the hive of bees you expressed to me last July I got 60 lbs. of very fine comb honey. I did not send for the upper story, for I didn't think I would need one the first season. I made a box the same size of the hive, and two inches higher, and put the extra frame you sent with the bees, in the box. The bees built comb in both sides of the frame. I wintered them in a pit with ventilating-pipe up through the center. I reported my bees to the *Free Press* the same date of this letter, asking the editor to send you the paper with report. At this date my bees are in good condition—one colony of Italians in Simplicity hive, and one colony of blacks in box hive.

JOHN HENSWORTH.

Whitewood, Manitoba, March 25, 1884.

FRIEND H.'S REPORT.

I kept bees two seasons in Manitoba, and one in the Northwest. Through carelessness and mismanagement I have not increased my stock very much.

My bees started to work on the blossoms of the soft-maple, in the valley of Pipestone Creek, about the 20th of April, and they worked all through May on the blossom of willows. July and August are the best months for honey, when the prairie flowers are in bloom. I got only 16 lbs. of honey from one hive of black bees, and 60 lbs. from one hive of Italians. I have not wintered Italian bees yet; but if they stand the winter as well as the blacks, I will make report in the spring. The Italians were sent me by express from Medina, O., and I received them on the 13th of July. They were eight days on the road, and they carried in pollen and honey in two hours after they were liberated. They are much larger than the black bees, and can reach the honey in the prairie-flowers better. Manitoba honey, for quality and flavor, I don't think can be surpassed.

HONEY-CROP OF CANADA FOR 1880, AS PER CENSUS.

Inclosed please find the honey-crop of Canada, as given in the last census, in which you will notice Manitoba, 1080 lbs., which is not so bad for so cold a climate and a new country. WM. MOWBRAY.
Sarnia, Ont., Can., April 1, 1884.

	LBS.
Prince Edward Island.....	14,945
Nova Scotia.....	24,500
New Brunswick.....	78,203
Quebec.....	559,024
Ontario.....	1,197,628
Manitoba.....	1,080
British Columbia.....	365
Territories.....	—

Or 937 tons, 1745 lbs. 1,875,745

Did you ever! Even Manitoba, that some of the friends have asked about, inquiring whether bees could be kept there at all, has given 1080 lbs. Since my visit to Canada last fall, I have a great deal more respect for the brethren over there than I used to have. It does us good to stir around among people a little, you see.

FRIEND MUTH AND THE FLOOD.

I was away from home during two weeks of our flood, knowing above high-water mark was my own location; and when reaching home I landed per canal-boat behind my house, the only inlet to the city at the time. It was a trying time, which a number of my fellow-citizens will surely remember. I gave my bees a good overhauling in February, when I found all in splendid condition, in spite of our 24° below zero. Those of my stand's were strongest which had their entrance open their entire width. Cincinnati, O., March 12, 1884. C. F. MUTH.

A GOOD REPORT FROM TEXAS.

Last year gave us a short honey-crop; and, as a consequence, many bees in old gums starved out. I have 155 colonies in good condition, carrying in pollen, and breeding rapidly. In this country we have neither spring dwindling nor winter troubles. I use the Simplicity hive and the tiering-up system. I took last year 4500 lbs. extracted honey, of excellent quality. I sell extracted at 10 cts. People in the country here will pay no more for nice comb honey than for extracted. W. A. MCPHAIL.
Gallinas, Texas, March 6, 1884.

HOW TO FEED CANDIED HONEY.

My bees are all alive and healthy so far. I prepared them for winter last fall by reducing them to 4, 5, and 6 frames, according to the strength of the colony, leaving them 7 or 8 lbs. of coffee A sugar each, besides what honey they had. I think they had 15 or 20 lbs. each. Some of them have been out of honey for about a month, and I am now feeding candied honey on top the frames, which is the best way to feed that I have ever found. Ciccero, Ind., March 11, 1884. ELIAS BERG.

MOVING BEES TO CATCH THE BASSWOOD BLOOM.

Friend Root:—I have read every article published in GLEANINGS upon the above subject, and I wish to say that we have a field for basswood that is unsurpassed by any in the country, located on a railroad running north and south. Last year I saw tons of honey going to waste, and hundreds of trees, and not a bee to be seen on them. My boy broke off branches, and at times shook drops of honey from them. The hills here are a bright golden hue for three or four weeks, beginning about the 1st of July. We are about 125 miles north of Kansas City, and I would like to correspond with some of the bee-keepers in that section between this and the time of the honey-harvest. There are but few bees kept here, and some object to their being kept, because of their getting in the timber and inducing people to cut it down; but bees can be, and are, kept all the same. Bees need not be hauled more than one mile from the railroad to the timber.

FILLING EDGES OF SECTIONS SO AS TO AVOID PROPOLIS.

It is my opinion, that if the edges of sections are filled as all woods are that are to be finished, as furniture, etc., bees would not be very likely to cover them with propolis. Being an old hand in that line, I can tell you just how it is done, or how I am doing my own. For filling, take equal parts of linseed oil—either raw or boiled, but raw is better for every thing—benzine or turpentine, and Japan varnish; and to each quart of mixture add $\frac{1}{4}$ lb. wax or paraffine. Now add any kind of pulverized starch until you have a thick paint. Now place the sections so that the edges of 500 can be brushed over with a good bristle brush about one-third or one-half worn. When the filling begins to look as though it were drying, or looks as though the oil had been absorbed, take a piece of burlap and rub all the surplus off; and as you rub off, rub the filling in; then let them dry. The time and expense is but a trifle; any one can do the work, if careful. It is important to do the rubbing off at the proper time, and the time depends upon the weather and the Japan. After dry (next day or so), if a coat of shellac varnish, made of bleached shellac, $2\frac{1}{2}$ lbs. to a gallon of alcohol (or cheaper, wood alcohol), is added, all the edges will have a fine appearance; or if soiled, can be cleaned without any trouble.

A. COLLINS.

Milton, Mo., April 16, 1884.

Your suggestion is a valuable one, friend C.; but I am inclined to think, that rubbing on boiled linseed oil with perhaps a little varnish with it would be sufficient. If the bees find the surface smooth and waxy already, I do not believe they would attempt to put any thing on it; and if they did, the linseed oil would give the surface enough of an oily nature to prevent the propolis from sticking. I have oiled woodwork where it was exposed to the bees so that the propolis would readily cleave off. It cleaves off pretty well from the glossy sides of the enamel sheets, and I presume a very little oil would make it so it would not stick at all. In regard to the appearance of the edges of the sections, would customers fancy a filled edge? I should want to see it tried before deciding.

ALSIKE CLOVER.

I mail you with this a sample of alsike-clover seed of our own raising. I have 14 $\frac{1}{2}$ bushels for sale. It

was the honey-plant par excellence here this season. Five colonies and their increase gave over 1000 lbs. of surplus honey, and more than half of it came from five acres of alsike. It bloomed profusely and continuously for over three weeks; and while it lasted, the bees worked on it exclusively and in preference to the abundant white clover in the pastures. Walking over the pastures one would scarcely see a bee; but on going into the alsike patch, you would seem to be in the midst of a swarm.

Urbana, O., Feb. 2, 1884. JOHN C. BARNETT.

Perhaps I may remark, that we have a large stock of very nice clean alsike-clover seed on hand at the present writing, at the old standard price of \$10 per bushel. Our trade this year has amounted to hundreds of bushels, and yet the supply of the seed is not sufficient to bring the price down very materially. If the bee-keepers wish to raise pasturage for their bees, it seems to me there is no other plant that offers the inducements that alsike does.

A BEE-CELLAR WITH A SHOP ABOVE IT.

We were intending to build this summer a stone cellar for wintering bees, and shop above, to be used for extracting, etc., in the summer, and a work-shop in the winter. Would it suit, or would there be too much noise above? Will sand or sawdust, or cheap felt, lined in the floor, deaden the sound enough so as not to disturb the bees?

W. A. MURKAR.

Aberdour, Ont., Can., April 7, 1884.

Friend M., there would be no objection to the plan you propose, if you have your hives supported entirely on the ground. If the supports on which they rest touch any posts connected with the floor, the jar of the floor would disturb them; but otherwise you will need no extra thickness on the floor above.

WHITE CLOVER PRODUCING NO HONEY.

We have nearly a two-hundred acre farm, and I intend to sow 22 acres of silverhull buckwheat for my own and neighbors' bees; and if alsike will grow and do well here, I shall have a good many acres of that in time. I do not want to compel my bees to fly 3 or 4 miles to carry honey for me. I should think honey might be made a reasonably sure crop, managed in that way. Last year our bees did not get a drop of honey from the white clover. The clover was very plentiful all around, but no bees on the flowers. Did you ever have such experience? I did not get much honey, but the little fellows did the best they could.

E. B. HOKE.

Cordova, Ill., April 17, 1884.

Yes, my young friend, we have seen times when the fields were white with the clover-bloom, and yet the bees seemed unable to find more than enough to barely live on. This is not very usual, however; and generally before the bloom is gone there comes a sudden change, and honey comes in at least pretty fairly.

A WORD IN FAVOR OF THE CYPRIANS.

The Cyprian bees are the most valuable we have got. They will not swarm, if given room enough, and will make more honey than the Italians, and they will not contrive so many ways to use it up as the Italians. When our basswood ceases here, the Italians rush their brood-rearing to the fullest extent, while the Cyprians seem to slacken up and raise no more than the little honey and bee-bread

they gather will permit. I have got swarms of Italians that had 150 lbs. the middle of last July that I shall have to feed through April, while Cyprians that had the same amount have nearly all of it now; and, at the same time, are the fullest of bees, and every one is bent on self-defense. A. W. CHENEY.
Kauawha Falls, W. Va., Mar. 24, 1884.

Friend C., our experience has been that the Cyprians and Holy-Lands are more apt to rear brood out of season than the Italians. Surely you can not mean that a single swarm of bees has consumed 150 lbs. since last July. They must have been monstrous swarms, or else you have made a mistake of a hundred pounds or so.

QUEENS THAT WON'T LAY.

The five last queens I got from you last season turned out all right but one. I introduced her to a colony successfully, but, lo and behold! she never laid an egg after I got her. Now, what do you suppose was the matter with her? I kept her for seven weeks. Some days she looked longer than others, and I was sure, almost, she was going to make a start, but she did not. The colony would keep building queen-cells. I gave them a frame of brood several times to keep the colony from running down, so at the end of seven weeks I had to pinch her head off and give them another one.

FERTILIZATION OF THE QUEEN-BEE; SOME MORE FACTS IN THE MATTER.

I was very much interested in the observations of J. S. Hughes, in March GLEANINGS, page 160, of drones congregating in large numbers in the air, to which queens resort to become fertilized; but they sometimes become fertilized without going very far from the apiary. I saw a queen mating with a drone last season about 1 o'clock in the afternoon, not more than 15 feet above the ground, so you see I had a good chance to see proceedings. Their abdomens were together; they seemed to be pulling in opposite directions until they became separated, and arose out of sight. I was attracted by the noise of the drone, for it was a very still day, so I believe they often become fertilized sometimes very near home, when drones are flying pretty thick.

SOME KIND WORDS IN CLOSING.

While I am bothering you with this letter, for I presume you have hundreds to read, I must say I admire the Home readings very much. They are like manna to the soul. I always save them for Sunday reading. There is always some encouragement in them—something to lift us upward and onward. They will reach hundreds who never enter a church of any kind. They will be like bread cast upon the water. Go on, my brother, go on; you will at last win the well-fought day when you come to cross the swelling flood. W. J. SAUNDERS.

Meaford, Ontario, Can., March 21, 1884.

We have occasionally a queen such as you describe, friend B., or sometimes they won't commence laying in spring; and I have seen them increase in size until they looked like a queen in the height of the season. One such queen commenced laying after I had put her into a large thrifty colony, but would not in a nucleus where she was. Of course, it would be our loss, for we do not want you to pay for any queen that never laid an egg.—I am very much obliged to you, my good friend, not only for the facts you furnish, but for your concluding kind words. I have

tried to do the will of the Master, but often feel sad to think I do it so poorly amid the constantly increasing array of busy cares. Do not forget to pray for me.

SOME WORDS OF ENCOURAGEMENT FROM FRIEND PARSHALL.

It has been a long time since I have been to see you. The first of last August I wrote up a good letter for Blasted Hopes; and after I got it finished I was ashamed to complain, and tore it up. The first of August I had not got a single pound of honey, nor had a swarm of bees; the 15th I had my first swarm, and by the 15th of Sept. I had taken 1000 lbs. comb honey, and five 22-gallon barrels of extracted. Our Sunday-school still lives, and is doing well with such a poor tool as I for superintendent.

Now for some of my troubles. The 9th of December we lost our only daughter, 16 years old. She had "walked with God" for three years, "and was not, for God took her." Oh what a vacant place there is in our family! But Christ is with us, and is precious. My prayer is, that God may bless you and all the boys and girls who are helping you. Your brother in Christ,
JAMES PARSHALL.

Skidmore, Mo., April 21, 1884.

Friend P., you will always prosper, not only with bees, but with the Sunday-school, just so long as you keep that hopeful spirit, and do not forget to trust God. May God help you in your affliction from the death of your loved one, and may you be enabled to still say, "Though he slay me, yet will I trust in him."

WHAT SHALL WE USE FOR BEE-FEED?

Should this reach you in time, will you please state in GLEANINGS if you have any grape (or corn) sugar, for feeding bees, and give price? Also please give net cost of a barrel of amber sugar, shipped from your place. You would doubtless very much oblige a number of your friends by stating if it would be better to purchase cheap sugar for spring feeding, or a low grade of extracted honey.

JOHN BUMGARDNER, JR.

Kimbolton, O., March 25, 1884.

Friend B., the extremely low price cane sugar is now, renders it of little object to use either grape or amber sugar. Granulated sugar can now be bought by the barrel in New York for 8 cents. The cheapest amber sugar that I know of is 6 cents, and grape sugar is worth 4¢. We have not kept grape sugar for sale for some years, but it can be purchased of the Buffalo Grape Sugar Co., Buffalo, N. Y. While grape sugar, amber sugar, and cheap honey may be used safely for spring feeding, after the weather is warm enough so the bees can fly, or during a dearth in the summer, I would not use any of them at any season of the year, when there would be a likelihood that any of them might remain in the combs for winter use. Granulated sugar is cheaper than you would be likely to get cheap honey, and it is absolutely safe wintering, while these other things are not. Honey stored in the combs, and sealed up during the clover and basswood bloom, is perhaps as safe as granulated sugar, although I do not consider it any better.

A SUBSTITUTE FOR SMOKE IN HANDLING BEES.

I have been looking up something in place of smoke for the bees. I have used a drug instead for

the last three years, and found it to be better and nicer. I will give it to my bee-friends to use. It is my own recipe and no patent. Oil of wintergreen. Try and get the genuine article, and I will guarantee it answers as well as smoke. I put two drops on my hands, then rub them together, then rub my hands on my face. If bees are cross, rub some on a cloth and put it on top of the combs, and in a short time the bees will boil out at the front of the hive.

S. SPIDLE.

Easton, Wayne Co., Ohio, Mar. 20, 1884.

Well, is not your substitute rather more expensive than rotten wood, friend S.? If I am correct, oil of wintergreen, when pure, costs a big lot of money; and if you use but a very small portion at a time, having so costly a drug about will be rather expensive, will it not? We should be glad of a report from some of the friends who feel inclined to try the above.

OUR BUSINESS.

One of the very evident things just now to any one who takes the trouble to observe, is, that a great deal of money is being made in ordinary bee-keeping. Quietly and steadily a majority of those engaged in it on a proper basis are accumulating a competency. This is true of bee-keepers as a class; and the fact that men are met with who are apparently losing ground in the business counts for nothing as an argument against it. No business is known to men in which everybody can succeed, and occasionally one is met whose failure is only the greater because he had the greater opportunity. A, B, C, are doing quite well with their bees; but E complains that he is losing money. This proves nothing, except that the others understand the business, and E does not. Those who find that bee-keeping does not pay in these days, need to change their stock or remodel their methods; something is wrong, and they can not be too prompt in finding out what it is. But whatever the trouble may be, reader, rest assured that the fault does not lie in the business.

FR. HOLTKE.

Carlstadt, N. J., March 20, 1884.

REPORT FROM GRAND-RIVER APIARY FOR 1883.

I commenced the season with 13 colonies, but not as strong as they should have been to give the best results; and not being in the best of locations, I did not look for much profit. From two Italian queens I raised 18, and from my 13 swarms I increased to 30, and bought 3 for \$3 per swarm, furnishing the hives myself. In preparing for winter I reduced my bees to 28 colonies, and packed them in clover chaff. I received about 600 lbs. of extracted honey, and 50 lbs. of comb honey in large frames. I find the only way to make bees pay is by economy and industry.

LUTHER B. KENYON.

Lyons, Ionia Co., Mich.

WHY DO BEES SOMETIMES KILL THEIR QUEENS IN THE SPRING?

Will you please give us a chapter in GLEANINGS as to the cause of bees killing their own queen in the spring? I have lost several that were laying all right a month ago. One queen I found in a ball, and nearly dead, and a well-developed queen-cell in the hive at the time. The others did not start cells till the queen was dead.

GEO. E. HOVEY.

Holland, O., April 14, 1884.

Friend H., there may be several causes for this strange behavior. Perhaps your

hives are too close together, and some of the bees had got into the wrong hive. May be you have been moving your hives, or robbing has got started in your apiary. When our bees got badly demoralized by the old spring dwindling, they sometimes used to attack their queens, and kill them when it seemed to me they did it just because they had become weak and discouraged, and, as poor humanity often does, made a bad matter worse by cutting off the only hope they had of bringing up again.

POISONOUS HONEY FROM THE MOUNTAIN LAUREL.

This evening I concluded I would go up on the mountain-side and see if I could find out from what my bees were gathering such enormous quantities of pollen. So, putting A B C under my arm, I began scaling the rough and steep mountain. I had not gone far before I came upon a perfect mat of what is called by the people here, "mountain laurel," which was just blooming out in a purple pea-shaped bloom. I saw bees gathering honey from it. I turned to page 163 of A B C, and read Dr. Grammer's article on poisonous honey. I am troubled about what to do. If this is the same laurel he speaks of, I will give a description of it. It is a low thick bush, with small leaves, in size about like black locust, but they are very thick, as it is an evergreen. It bears an oblong pod which looks something like a bean, or more like a pea. These peas mature in the fall; and when bulled they are perfectly red, nearly round, and very hard. It is altogether different from what we called laurel in Kentucky. Can some bee-keeping brother tell me what it is, and what I should do, in case it yields poisonous honey? Were it not for this trouble, I can not see any thing to keep bees from doing well here, as we have a great many honey-producing shrubs and plants, chief among which are the live-oak, white sumac, redbud, Spanish dagger, and the so-called "bee-bush," which bears a profusion of delicate white flowers, very fragrant, and said to bloom afresh after every rain, and I saw them literally covered with bees last summer and fall.

Burnet, Texas, Mar. 26, 1884.

C. W. HARDY.

I shouldn't be alarmed, friend H., till I had taken some of this honey from the hives, freshly gathered, and made a test of it on myself. Take a little taste. If it makes you sick, then you may be alarmed; but if it produces none of the symptoms mentioned in the A B C book, I shouldn't be troubled about it. Perhaps they do not get enough of the honey to produce any disagreeable effect, and may be it is not the same in all localities.

HAVING SEVERAL APIARIES LOCATED 4 OR 5 MILES APART.

I have 300 colonies of bees now. All wintered outdoors on their summer stands, and I don't think I ever had bees in better condition at this time of the year. I have them in 5 different apiaries, from 4 to 7 miles from home. I shall start another yard this spring, as I think they do better when there are not over 50, spring count, in a place. I hire boys to help do the work. We work for extracted honey, and have nobody to hive bees on Sunday or any other day, except when we are there, once in 8 or 10 days. We got 22,000 lbs. last year, and am looking for 30,000 this year.

EDWIN FRANCE.

Platteville, Wis., April 6, 1884.

In your price list you say: "If the chaff hives are well supplied with stores, we hope they will need no attention whatever, from the time honey ceases until it comes again the next season." Now, I would like to know if it is or is not an established fact, that bees are as safe in chaff hives as any other way in winter, and summer also. I see you speak of chaff-hive apiaries, in A B C book. Do they use the chaff hive? if so, do they remove the chaff? In winter do you have the upper story full of frames, or not? and which story do the bees occupy?

Brock, Neb., Mar. 22. MRS. ADDIE I. JOHNSTON.

We think bees are about as safe in chaff hives, all things considered, as anywhere else, though I suppose during very severe winters they might be saved where kept in the cellar, where they would perish outside in chaff hives. The chaff is always to remain in the hive, of course, for we need it in summer almost as much as in the winter, to protect the walls of the hives from the intense heat of a July sun. Taking the chaff out and putting it back would be altogether too much trouble. The bees are always wintered in the lower story. If wintered in the upper story, we could not protect them as we do where they are below. The upper story is for surplus honey in summer, and to hold the chaff cushion in winter.

HAVING LETTERS OR FIGURES BUILT IN COMB HONEY.

I want to give the bee-folks some hints in regard to having bees make the letters on comb honey. Now, so far as I have experimented, I am satisfied that it is a very simple thing to have the bees make nice raised letters on comb honey, and I have had some raised nearly one-half inch, and they can be seen 100 feet off very plainly. Mine are made in Langstroth frames, and are about four inches in size. I can't give my mode of experiment for it would be too long, and I don't think of much use. The principle is what I wish to let them know, and here it is: Take a piece of tin, and cut the letters out, the same as for a brand. Now place the tin close up to a card of unfinished comb, and let the bees do the rest; and if you do your part with a little skill and science, you will be rewarded with as fine delicately finished letters as you could wish. Now, Mr. Root, if you think this would help friend Lawson, or any one, put it in GLEANINGS.

C. E. BARBER.

Langford, Boulder Co., Col., Jan. 24, 1884.

BROOD-COMBS BUILT ON THIN FOUNDATION.

Will comb honey built on your thin fdn. have a tough center? Do you have any complaints from customers? What kind of lubricator do you use? How do you prepare it?

W. H. KERR.

Waynestown, Ind., Mar. 3, 1884.

We have had no complaint of the tough center in comb honey built on our fdn. for several years. The only lubricator we use is starch, made just as it is used for starching clothes. We get a cheap quality of starch by the barrel, that answers just as well as any. To make fdn. with the base nearly as thin as that of natural comb, we are obliged to screw the mill down very close, and roll narrow strips, say just wide enough for the section box. It is a pretty difficult matter to make sheets wide enough for brood-combs, with the bases as thin as they should be for section boxes.

Blasted Hopes.

Or Letters from Those Who have Made Bee Culture a Failure.

I SEE no "bee talk" in GLEANINGS from Kentucky, and feel that this section should have at least one representative. I will, with your permission, submit the following for Blasted Hopes. Out of the 10 strong colonies packed in excellent winter quarters, but 3 are now alive (just alive, and queenless). Two near neighbors, one who had 35, lost all, and the other, with 32, has but one colony living. Seven miles south of us, on the Cumberland River, bees fared better, although several parties report severe losses, and all believe it to be a regular case of "freeze out," as many colonies had stores enough to winter them through. The only party I can hear from who lost none had five colonies in the old-style gum, and reports all strong and in good condition, which seems to be one point in favor of the log gum. However, with all our losses, we are not completely discouraged. As for myself, I don't think I could feel thoroughly in the business without one or two failures.

A. T. SHOTWELL.

Somerset, Ky., March 18, 1884.

If you want reports of blasted hopes, I will send you mine, although my hopes are not really blasted, for I have got one colony left out of 6, which is better than some bee-keepers have done in this vicinity. About the first of last November I packed my 6 colonies with straw, after Cook's plan, putting 3 in one box by moving them a foot or so at a time, until they stood side by side. Feb. 19th they had a fly; 5 were all right, and one was dead. March 21st they had another fly, when all were dead but two, one of which was queenless and very weak; the other had brood and a queen, but was rather weak, so I united them without any quarreling whatever, and they now appear to be all right. I have kept bees almost a year, and I have come to this conclusion: Bee-keeping is a good business, but it would be a great deal better if we only knew just how to fix our bees in the fall so that we could be sure they would come out in healthy condition in the spring.

HOWARD L. HUTCHINSON, 0-1.

May, Tuscola Co., Mich., Apr. 11, 1884.

BLASTED HOPES — BUDDING AGAIN.

Six years ago I caught the bee fever. A friend came to see me with the I X L hive, and gave me a few lessons in transferring, and how to care for them. We bought 15 or 20 colonies in box hives; transferred all but one; divided, spaced off our apiary, and took a look at them once a week; got about 100 lbs. of honey in the fall; packed them away for winter — 56 colonies. In the spring we had 55 empty hives, and one (the box hive) colony of black bees. Our ardor had considerably abated. From that one box hive we have 12 good strong colonies this spring. When a child, mother told me if I lost my knife, to go and look for it as near as I could recollect where I had it last; and so after reading GLEANINGS one year, which a friend had kindly sent me, I ordered your A B C book, and from that I learned that bee-keeping, to be successful, must be followed as any other business — must be made a specialty, and looked after more frequently than "once a week."

L. F. STODDARD.

GLEANINGS IN BEE CULTURE.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE
OF READING MATTER.

MEDINA, MAY 1, 1884.

Charity rejoiceth not in iniquity, but rejoiceth in the truth.
—1. COR. 13:8.

We have now 6782 names this 29th day of April, 1884. Don't you think it a little encouraging, friends? We do.

A GOOD friend takes us to task for crediting Pope with the little couplet which appears on page 273 of our last issue. He shows conclusively that Shakespeare wrote it, though with somewhat of a different wording. We did not mean to rob William of any of his well-earned laurels, and hope this will make it all right.

UNTESTED QUEENS WANTED.

UNTIL further notice we will pay 90 cents each for untested queens. At present we are prepared to ship by return mail queens, of any grade, except blacks and hybrids. We have none of either kind just now in our apiary. We have a fine stock of imported queens on hand, and another lot coming from Italy as soon as the weather is warm enough. All orders we expect to go by return mail or express.

WHITE CLOVER HONEY AT TEN CENTS PER POUND.

We have just received 50 cans of beautiful white-clover honey, which we offer to any who may want it, at an even 10 cents per pound. The cans are five-gallon iron-jacket, and are all ready to ship anywhere. There are about 58 lbs. of honey in each can, and 68 cents for the can itself would make \$6.48. But to make even change we will ship them to any address for an even \$6.40. The honey is equal to any I have ever handled.

PROF. COOK'S BOOK, "INJURIOUS INSECTS."

SOME of the friends will be glad to know that we have the above little book in stock again, and can furnish copies promptly on receipt of price, 25 cts. If wanted by mail, add 3 cents more for postage. Injurious insects sometimes do a "heap of trouble" in a little while, which might be saved if we knew how to manage; therefore the little book will oftentimes pay many times its cost in a little while.

HOW TO SEND MONEY BY REGISTERED LETTER.

WHEN you send money by registered letter, put the money in the envelope yourself, and seal it up. Then have your postmaster register it. Do not, under any circumstances, give the money to your postmaster. In fact, he is prohibited by law from receiving or inclosing it. Several losses have occurred recently where the money was handed to the postmaster to inclose. The envelope came through, but not the money—or, at least, only a part of it.

NOS. 30 AND 36 WIRE ON 1-LB. SPOOLS.

We have just got our spool-wire folks started on the above, and are now able to furnish No. 30, on 1-lb. spools, for 20 cents; 10 spools for \$1.85; 10

spools for \$1.75. No. 36 wire, 40 cents per spool; 10 spools, \$3.75; 100 spools, \$35. The latter comes high, because it is a pretty big job to wind a pound of No. 36 on a spool. If any of you have handled any of the latter very much, you will know all about it. If wanted by mail, add 20 cents each for postage.

THE SECTION BUSINESS AT THE PRESENT DATE.

AS the weather has been beautiful for drying basswood lumber, we are now crowding our factory on sections to the utmost; but at the rate orders are pouring in, it will be some little time yet before we can fill orders for sections promptly. The "Home of the Honey-Bees" is doing more business now than it ever did before at this season of the year; and with the way orders are pouring in by each mail, it would almost seem as if our establishment would have to have still another enlargement. Mail and express orders go with little if any delay; and orders by freight, with but few exceptions, for any thing that does not include sections.

SEPARATORS OF THINNER TIN.

SOME of the friends will remember, that a few years ago we furnished separators of what is called "tagger's" tin. This tin is only about one-half as thick as the regular kind, and therefore would carry off less of the animal heat from the hive, for metals in *thin* sheets are much better non-conductors than sheets of greater thickness. The reason why we have not used it of late was, that the price was too great; but we have recently run on to a lot of 50 boxes. It is much lighter for shipment, and it can be fastened to frames with wire nails, without pricking any holes. As it kinks up or bends a little easier, it will have to have a little more care; but we think in every other respect it is greatly to be preferred to tin of the ordinary thickness.

HIVES AND SECTIONS BY EXPRESS.

NOW, friends, look out about ordering heavy goods by express; that is, remember that express charges are generally *awful* on any thing weighing 100 lbs. or more. We are puzzled every day to know whether some of you knew what you were doing when you said "express" or not; therefore if you are posted about this express business, and expect to pay all the goods are worth, or more too, by way of express charges, just add to the end of your letter, "I know very well what the express charges are likely to be on this shipment; but I must have the goods at once and expect to pay accordingly." Then you see we will know exactly what to do. A few days ago, a friend down South made quite a good-sized order, and said distinctly, "Send them by express." The express charges would have been about \$45.00, and he thanked us with some energy for having disobeyed orders, and sent the goods by freight when he told us by express.

A REVERSIBLE FRAME THAT IS ALIKE ALL AROUND, AND CAN BE USED AS WELL ONE SIDE UP AS THE OTHER.

SOME of the friends may have noticed an advertisement of O. J. Hetherington, of East Saginaw, Mich., in regard to a reversible-frame bee-hive. Knowing that friend H. rarely comes out in public with a thing unless it is just right, we sent for a sample, and confess the hive comes the nearest to being a rival of the Simplicity hive of any thing I have ever before seen. Externally it is a Simplicity hive; in fact, a Simplicity hive can be, with a little

expense, changed so as to take this reversible frame. The frame, as I suspected, is a modification of the old Quinby closed-end frame. But this is not closed end. It rests on metal corners; will go in just as well one side up as another. I should really like to try handling bees in this hive one season, and I think we will put bees in this one to try it. The frame is exactly the same as the L. frame. Wide frames to hold sections are made in the same way, and the whole arrangement is admirable. We are having engravings made, and propose to illustrate it fully in our next number. There may be difficulties that will develop themselves when we come to work it; but there are some very decided advantages in it over a suspended frame, aside from this feature of the frames being reversible. The metal corner that the frame rests on is the invention, I am told, of our old friend Vandervort, of Sprout Brook, N. Y. Friend H. writes that he has used the hive three or four years past.

So far as reports have been received, we judge that the matter of wintering has been more favorable than for many years; and if I am correct, there are more live bees now in the United States, and Canada too, perhaps, than ever before since the world began.

CIRCULARS RECEIVED.

- W. H. Proctor, Fair Haven, Vt., sends us a 4-page price list. Bees and queens are his specialty.
- J. P. McGregor, Freedland, Saginaw Co., Mich., sends a 1-page price list; specialty, section boxes and hives.
- H. A. Goodrich, Massey, Hill Co., Texas, gives us prices of queens, on a postal card.
- T. L. Thornton, Diving Ridge, Ky., sends out a 1-page circular; specialties, honey-extractors, hives, and sections.
- B. P. Barber & Co., Colebrook, Ashtabula Co., O., send out a 19-page price list of general bee-supplies and job-printing.
- J. S. Holcombe & Co., Lambertville, N. J., send out a 4-page circular, mostly of poultry; hives, bees, queens, on last page.
- E. F. Smith, Smyrna, Champaign Co., N. Y., sends out a 10-page price list. Friend S. furnishes supplies in general; and among them, kegs for extracted honey.
- The Ber in Fruit-box Co., Berlin Heights, O., send out another circular in regard to their sections made by slicing instead of sawing. Although we can hardly agree fully, that they are as nice as nice by sawn sections, yet as their customers seem to be well pleased with them, and as the price is less, no doubt they will meet with a good sale. If you are in doubt in regard to the matter, you can get a sample thousand for only \$4.00.
- S. C. Perry, Portland, Ionia Co., Mich., sends out an instructive 4-page price list; specialty, bees in brood by the thousand. Friend P. has a table of prices of worker bees by the thousand. The first week in May, 50 cents per 1000. Then they go down 5 cts. less each week until the 1st of July, when they are offered for only 18 cts. per 1000. Just think of that, friends! a whole thousand of yellow-winged worker bees for only 18 cts! Friend P., somebody will send you just 18 cts. in a letter, for 1000 bees, then what are you going to do? Send them by mail and pay postage! I guess it could be done, if they don't hatch out on the way, and die before they get there.
- Mrs. Lizzie E. Conant sends out a supplement to her 1884 circular; and I am sorry to say that it has its old bitterness toward almost all the other brethren and sisters in the bee business. So long as she persists in her extravagant prices for the things she sells, and her persistent declarations that bee-journals and supply-dealers in general are trying to injure her, we can not recommend anybody to patronize her. A great many papers have declined to receive her advertisements; but as she sends some sort of an equivalent for the money she receives, other papers think it right to insert them.

The \$1.00
Fountain Pump
—OR—
SPRINKLER.

The above cut gives a pretty good idea of the Fountain Pump, that has occasioned such a brisk trade during the past six months. It is easily operated, and will throw a stronger stream, and throw it further, than the Whitman pump; but it can not well be carried in the hand with a pail of water, as we would carry the Whitman; neither is it as durable, as it is made of tin instead of brass. It has no hose attached. At present the manufacturer objects to our selling single pumps for less than \$1.00, although we can sell three for \$2.25; in lots of ten, the price is \$6.00; 100, \$55.00.

To parties living at a great distance they can be sent by mail for 60 cents. They will answer very well for sprinkling a colony of bees, if you can get near enough to them to set your pail down while you throw the spray. Each pump has three different nozzles—one for a spray, one for a small stream, and one for a large stream. We consider them a great acquisition. **A. I. ROOT, Medina, O.**

CONVENTION NOTICE.

The next meeting of the Keystone Bee-keepers' Association will be held in the rooms of the Y. M. C. A. in Scranton, May 13, 1884, at 10 o'clock. Interesting subjects will be discussed. All are invited to attend. **GEO. H. COLVIN, Ass't Sec'y.**

Borodino, N. Y., Aug. 15, 1882.

CYPRIONS CONQUERED.—All summer long it
has been "which and t'other" with me and the
Cyprian colony of bees I have — but at last I am
"boss." Bingham's Conqueror Smoker did it. If
you want lots of smoke just at the right time, get a
Conqueror Smoker of Bingham. Respectfully,
G. M. DOOLITTLE.

Mess. Bingham & Hetherington:—

DEAR SIR,—I received those Smokers in good or-
der, and am much pleased with them, and the im-
provements, over the old ones. They can not fail
to please your customers. Thanks for promptness.
Yours truly,— J. M. HIBBARD.
Athens, Ohio, April 21, 1884.

Langstroth always on hand. Best smokers, all sizes. Honey-knives, extractors, Gray's outside and Locke's inside feeders. Drone traps and excluders, all at bottom prices. Send stamp for price list.

9-12db A. FAHNESTOCK, LaPorte, Ind.

GREETING!

To my many old customers and the public: I am glad to announce that I am again to the front in the manufacture and sale of all desirable kinds of comb foundation. Wholesale and retail prices on application.

J. H. NELLIS,
Canajoharie, N. Y.

We have been showing you pocket-knives, but now call your attention to a good bread-knife. Blade is 8 inch, and the best steel made. Price, postpaid, 55c., \$4.60 per dozen. 6-inch butcher-knife, our best, postpaid, 75c. Razor-steel kitchen-knife, 25c. Our 48-page list of knives, razors, and scissors mailed free to all.

9d MAHER & GROSS, 74 N. Summit Street, Toledo, Ohio.

STANLEY'S AUTOMATIC HONEY-EXTRACTOR

REVERSES THE COMBS BY REVERSING THE MOTION OF THE CRANK.

THE COMB - BASKETS ALWAYS STOP IN MOST CONVENIENT POSITION FOR PUTTING IN OR REMOVING COMBS.

Each Extractor has a Long Strong Crank, so that the Machine is Easily Operated, and a Brake to stop the Motion is so Arranged that it Can be Managed with the Left Hand.

THEY HAVE BEST VERTICAL GEAR, WITH TWO BEARINGS FOR CRANK-SHAFT.

All cans are made from XXXX tin; or if desired, we will make them from heavy galvanized iron at same price.

The cylinder of can is all in one piece. We make all our Extractors to take 2 or 4 combs, and they can be changed from one to the other in one minute. We make the Automatic to hold any size of frame. We challenge any extractor now before the public to do one-half the work of our 4-frame machine. Do not pay out money for inferior machines, but write us for terms, as our prices are reasonable.

We want a good live agent in every bee-keeping locality, and especially in Cuba or San Domingo, to whom we will pay a liberal commission. If you have not already received our circular giving full description, send your name on a postal at once to

G. W. STANLEY & BRO.,

WYOMING, NEW YORK.

ALBINO ITALIAN QUEENS, BEES SUPPLIES FOR 1884

HEADQUARTERS FOR THE ALBINO.

For beauty, for kindness, and for large yields of honey, the Albino bee ahead. Last season we increased one colony to 6, from which we took 500 lbs. of comb honey, and all had abundant stores for wintering. We have a heavier stock of bees than ever before, and will be able to furnish queens in large numbers. We have also added to our buildings, and increased our facilities for Hives, Comb Foundation, and Apiarian Supplies generally. Send for Price List. Please write your address plainly.

We have traded for some hybrid and black bees, which have fine queens, which we will sell, hybrids at \$1.00, blacks, 50 cents. Address

9-11d S. VALENTINE & SON, Hagerstown, Washington Co., Md.

1884. For Sale. 1884.
Pure Italian Queens and Bees

FIVE-FRAME (Langstroth Frame) COLONIES

A specialty. Five bright new combs, wired in, covered with young bees, filled with brood and stores with a pure young fertile Italian queen. My queens are carefully bred from best imported and homebred stock. Bees gentle, industrious, and beautiful; better than a natural swarm. I was awarded first premium at St. Louis Fair last fall over quite a number of worthy competitors for best Italian queens and bees. Send for circular and price list.

WILLIAM LITTLE,
 Marissa, St. Clair Co., Ills.

SIMPLICITY B-HIVES,

with 10 frames and cover. 65 cents. The same in flat, 50 cts. Double-story Langstroth hive, with 20 frames, all complete, \$1.00. 1-lb. sections, per 1000, \$3.75.
 T. A. GUNN,
 5-7-9d. Tullahoma, Tenn.

Tested Queens a Specialty.

Have been handling Italian Bees for 24 years; so you see that when you get my \$2.00 tested queens in May and June, you buy of one who knows the bee. Untested for the same months, from imported queen, \$1.00.

KIND WORDS FROM OUR CUSTOMERS.

WHAT GIVING UP TOBACCO LEADS TO.

We have a Band of Hope (temperance) with nearly 900 names, in our town. I need not say I am a member, as you know I quit tobacco two years ago. Your brother in Christ, — DAVID PRATT. Clinton, La., April 14, 1884.

The Clark smokers went off like hot cakes, buckwheat cakes at that. They work like a charm, and I think are well worth what they cost, and are what you recommend them to be. Will the clerk please pass this into the purple basket, for it is a prompt basket? G. A. WILLS. Enfield, White Co., Ill., April 14, 1884.

It affords me pleasure to say, that the package of apiary supplies and sundries, as also the extractor and trees ordered of you recently, came safely to hand on time; and after a critical examination of them in detail, I find every item correct as per invoice, and entirely satisfactory. In fact, Myrtle (our little six-year-old daughter) expressed the idea exactly when she emphatically remarked after the goods were opened, "Papa, I think Mr. Root certainly is a dear, good *bee-man*, don't you?"

A KIND WORD FOR THE HOLY-LANDS.

To begin the season, I have to report 11 colonies of bees — Italians, Holy-Lands, and hybrids, in movable-frame hives. All brought safely through the winter so far, and are apparently doing very well. I should like to hear the Holy-Lands more generally criticised by those who have bred them. From my own experience with a single colony of them, I think them pre-eminently ahead of my Italians, blacks, or hybrids, giving me more honey *by far* than either, being *greatly* more prolific, and far less vicious and irritable. In fact, this last good quality seems to characterize them; for while I invariably have to subdue the bees with smoke, I frequently handle them with impunity without the use of it. Can it be that mine is a gentle "strain," or is it a lack of knowledge of their many good traits that seems to hold them in the background? My Holy-Lands and Italians (one colony of each) were both the progeny of imported queens procured of the same dealer; and judging these two colonies by every standard of excellence known to me, the Holy-Lands are immeasurably ahead. H. H. SPINDLE. Verbein, Va., April 14, 1884.

[Friend S., give my best respects to my little six-year-old friend, and tell her I try to do as well by every one as I did by you; but in sadness I am obliged to reflect that there are a great many whose experience in dealing with Mr. Root has been different from your papa's.]

Black and Hybrid Queens For Sale.

For the benefit of friends who have black or hybrid queens which they want to dispose of, we will insert notices free of charge, as below. We do this because there is hardly value enough to these queens to pay for buying them up and keeping them in stock; and yet it is oftentimes quite an accommodation to those who can not afford higher-priced ones.

I HAVE two black queens for sale, at 40 cts. each. Ready now, and safe arrival guaranteed.

A. L. LINDLEY, Jordan, Jay Co., Ind.

I CAN furnish 20 black queens at 40c each; also 20 hybrids; price 50c each.

CHAS. MILLER, Justus, Lack'a Co., Pa.

HONEY COLUMN.

CITY MARKETS.

DETROIT.—*Honey.*—The honey market is almost lifeless; 17 to 20c is asked for good cap honey, with but few buyers. A. B. WEED.

Beeswax is scarce at 30 to 35c.

CHICAGO.—*Honey.*—The season is well over for comb honey, and the stocks are really very low. Prices range from 12@16c, according to quality. Extracted honey finds a dull market at present at 7@8 cts. *Beeswax*, 30@38c. R. A. BURNETT,

May 10, 1884. 161 South Water St., Chicago, Ill.

CLEVELAND.—*Honey.*—The honey market continues unchanged; 1-lb. best white is in excellent demand at 18 cts.; but larger sizes are not in urgent demand, 2-lbs. selling at 17 cts., when there are no 1-lbs. Second quality continues very dull at 14@15c. Extracted not wanted at all in any shape. *Beeswax* scarce at 35c. A. C. KENDEL,

May 9, 1884. 115 Ontario St., Cleveland, O.

KANSAS CITY.—*Honey.*—Demand for choice comb is still good, and moving freely at 15@16c for 2-lb. sections. Market is bare of 1-lb. sections at present, with considerable inquiry for them. Extracted in fair demand, 8½@9c for white, and 7@8c for dark. Very little of the latter now in this market, and a few thousand pounds would meet with very ready sale. JEROME TWICHELL,

May 6, 1884. Honey Depot, 514 Walnut St., K. C.

ST. LOUIS.—*Honey.*—During the past week, brokers bought up all the extracted honey in barrels and half-barrels that was in shipping order. Choice would now bring 7½c in barrels, and 9@10c in cans. Not much comb honey is offered for sale, and very little demand. In good order, worth about 15c; white clover, 18c. *Beeswax.*—Not much arriving. Yellow, 35c. W. T. ANDERSON & Co.,

May 12, 1884. 104 N. Third St., St. Louis, Mo.

NEW YORK.—*Honey.*—Comb honey is in fair demand, but prices are ruling low. One-pound sections have been in good demand all season, and our market entirely sold out, but still well stocked with 2-lb. sections. We quote fancy white, 2-lb. sections, at 14@15c; good white, 2-lb. sections, 13@14c; fair white, 2-lb. sections, 12@13c. Extracted clover and basswood, 8@9c.

Beeswax is very scarce, and held at 37@38c.

THURBER, WHYLAND & Co.,
Reade and Hudson Sts., N. Y.
May 10, 1884.

WE CALL the attention of all wanting A No. 1 bees, Italian, Hybrid, or Cyprian, to the following, from one well known to the readers of this paper:

"I have never seen a case of foul brood; my bees are entirely healthy, and have always been so, and are O. K. in every respect. GEO. B. PETERS, M. D." We can furnish any number of the above bees, and will warrant satisfaction and safe delivery. N. B.—No bees sold from any apiary that has ever had a case of foul brood in it. Write for particulars and prices to FLANAGAN & ILLINSKI, 4-14b Lock box 965, Bellevue, St. Clair Co., Ill.

DADANT'S FOUNDATION FACTORY, WHOLESALE AND RETAIL. See advertisement in another column.

NOTES FROM THE BRIGHT-BAND APIARY.

I CAN now command 500 colonies in the queen business, if necessary. My intention is to produce queens not excelled by any. Price, untested, but laying in May, \$1.00 each; 90 cents each the rest of the summer. Tested queens, any time, \$1.50. The above are from imported Italian queens; queens bred from Kingsley's improved bees, same price. Kingsley's improved bee is simply a cross between the Cyprian, Italian, and Holy-Land bees; and in reality they are ahead of any race, both for color and honey-gathering propensities. Sample live workers sent for 3 cents to pay postage.

All orders promptly attended to; safe arrival guaranteed; full directions sent with each queen.

Make money orders payable at Shreveport. Address CHAS. KINGSLEY, Benton, Bossier Par., La.

The Bee-Keepers' Guide;

Or, MANUAL OF THE APIARY.

11,000 SOLD SINCE 1876.

12TH THOUSAND JUST OUT!

10TH THOUSAND SOLD IN JUST FOUR MONTHS!

2000 SOLD THE PAST YEAR.

More than 50 pages, and more than 50 fine illustrations were added in the 8th edition. The whole work has been thoroughly revised, and contains the very latest in respect to bee-keeping. It is certainly the fullest and most scientific work treating of bees in the World. Price, by mail, \$1.25. Liberal discount to dealers and to clubs.

A. J. COOK, Author and Publisher,
State Agricultural College, Lansing, Mich.

ITALIAN QUEENS

Sent by return mail. My motto is, "A fair equivalent for every dollar received." Prices:

Untested queens from imported mother, April and May, \$1.50; June and July, \$1.25; April and May, per dozen, \$15.00; June and July, per dozen, \$12.00. I will send GLEANINGS one year, and a queen, for \$2.00. Send money orders on Hillsboro. 7ftdb H. A. GOODRICH, Massie, Hill Co., Texas.

BEST GIVEN

FOUNDATION

WHOLESALE AND RETAIL.

I now have on hand a freshly made lot of Given Comb Foundation, made from strictly pure domestic wax, thoroughly cleansed from all impurities; in addition, the pollen is all removed. Size of brood and surplus, 8¼x16¼, or Langstroth size. Also Dadant's best Brood Foundation of same size, and 11x11, or Am. size.

PRICES:

Brood Fdn. per B. (either make) - - - - 50c.
Surplus Fdn. per B. - - - - - 60c.

For lots of over 100 lbs., write for special prices. No charge for boxing or delivery to cars. Send orders to

JAMES HEDDON,
DOWAGIAC, MICH.

DID YOUR BEES DIE?

Stock up your combs before they are spoiled, with bees by the pound. I can ship them safely. Two-pound colonies with a choice tested queen, \$4.75, or bees in any shape cheap.

DID THEY WINTER? Make 'em pay. Make your own foundation. Machines on hand ready to ship at \$3.75. See my circular. Discounts on large orders. OLIVER FOSTER, 9ftdb Mt. Vernon, Linn Co., Iowa.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

WHAT I DO WITH MY BEES AT THIS SEASON OF THE YEAR.

SOMETHING ABOUT SPREADING BROOD IN MAY AND JUNE.

HAVING seen lately that some think that my plan of building up colonies by spreading the brood is not a judicious one, and wishing in no way to mislead any, I am led to tell the readers of GLEANINGS just how I manage my bees at this season of the year. Some seem to suppose that they should go to work overhauling their bees and spreading the brood as soon as the bees can fly; but such is not the plan I adopt; for from experience I have found that the less there is done with the bees (except to ascertain that each colony has a queen and sufficient honey) previous to the time the leaves begin to put out on the trees, the better off the bees will be. If I had but four or five colonies, I could, by way of seeing what I could do, take them into a warm room every cold spell, as I once did to get them ahead as far as possible; but such a plan could not be carried out with an apiary of any size. Unless such a plan is adopted, the spreading of the brood before settled warm weather often proves worse than a failure, as advanced brood is often killed by these cold spells, which would soon add new life to the colony if they had remained undisturbed. Thus I defer trying to build up colonies more than they naturally will do themselves, until I am sure of warm weather.

With this purpose I will now tell just what I do. As soon as spring opens I go to each hive with smoke in hand, remove the cap, roll back the quilt a

little, and smoke the bees so they will run out of the way. If plenty of sealed honey is in sight along the top-bars of the frames, I let the quilt go back; and after putting on the cap, place a small flat stone on the center of the top of it. This stone tells me this hive has plenty of honey to last till the bees begin to carry in pollen. The next hive is looked at in the same way; and if I see plenty of honey it is marked the same. If I do not so see honey, I lift the frames to see how much honey they have. If they do not have 5 lbs. at the least, I place two flat stones on the right-hand back corner of the cap, which says such colonies are to be fed soon. If any are found entirely out, they are fed at once by giving frames of sealed honey, or combs filled with sugar syrup, if I have not the frames of honey on hand. These combs of honey or syrup are set on the outside of the brood at this season of the year, and not between the combs of brood as I do later in the season. Having set in the feed, the hive is marked with a stone, the same as was the first.

I wish to call attention to these stones for marking hives. In the first place they can be obtained in nearly all localities. If not, pieces of brick or tile can be used.

2. And most important, I can tell the condition of each hive just as far as I can see these stones, which is from one side of the apiary to the other.

3. They tell me what needs doing in the apiary, at a glance, with no time being consumed writing in a book, on a slate, or any such thing.

4. If any one enters the apiary and touches the hives when I am not there I know it, for they will always either let the stones slide off the covers, or

put them in a place where they tell nothing according to stone vocabulary, thus enabling me to tell if thieves or inquisitive people have visited my yard at any time.

To return: Seeing that all have honey, the apiary is left undisturbed till the first pollen is brought. At this time I look over each hive to see if all have laying queens, and honey. If any are found without a queen, a weak colony having a queen is united with the queenless one, and those short of honey are supplied as before, when they are again left till the trees begin to put forth their leaves. We can now safely calculate on settled warm weather, and the season's work can be advanced more now by an hour's labor than several days' work would accomplish previous to this. At this time I carefully go over each colony, noting its strength; and all colonies that have four frames or upward, having brood in them, are incited to greater brood-rearing by having their frames of brood reversed, by placing the two frames having the most brood in them on the outside, and those having the least, in the center. This does not spread the brood properly, but causes the queen to fill the outside combs of brood, which are now in the center, with eggs more fully than were the center ones before, thus giving frames compact with brood, instead of small batches of brood in many frames, thereby economizing the heat of the cluster of bees. Those not having four frames having brood in them are shut on to what frames of brood they do have, together with a frame of honey, by means of a division-board. The amount of honey is also noted, the prolificness of the queen, etc., and the stones are used in various positions on the cap, to tell the condition of each, inside, and also what should next be done. In a week I again go over those having their brood reversed, this time putting a frame of honey or a comb of syrup in the center of the brood-nest. As the bees remove this honey or syrup, the queen is fed and the comb quickly filled with eggs from top to bottom. I forgot to say, if sealed honey is used the cells are broken by passing a knife flatwise over them. It will be seen that thus far the combs of pollen next the brood hold the same position to the brood that they have heretofore, and they are not disturbed till all the other frames are filled with brood, when they are placed in the center to have the pollen exchanged for brood by the bees. Thus each week the brood is reversed, or frames of honey placed in the center till all is filled with brood. By this time the stronger of the weak colonies (those I shut up with the division-board) have then three or four combs filled with brood from bottom to top, when they are quickly built up by giving frames of hatching brood taken from those already having a hive full. Thus all are made strong for the harvest. This, in short, is my mode of management previous to swarming or the busy season.

Borodino, N. Y., May, 1884. G. M. DOOLITTLE.

Friend D., we have often used stones on top of the hives to indicate something, much as you do, but I never before thought of having the position of the stone have also a special meaning. This may be an interesting item to many of us.—In regard to spreading brood, with the number of frosts we have here in April, and even into May sometimes, I have about settled down to the idea that spreading the brood-nest, and putting a single clean worker comb in at a time was about

enough. If the hive is pretty full of bees, they will crowd over on to this comb so as to cover it pretty well the first day. One great advantage of this is, that the queen can go to work and fill this comb with eggs that will hatch out almost at the same time. This gives the bees an opportunity of caring for the brood with less running about than they would have to do otherwise.

FROM 16 TO 51, AND 3600 LBS. HONEY.

The Way Friend Balch Did It.

SEE REPORT ON PAGE 23, JAN. NO.

“YES, pa, you will have to write an article so long;” and he stretched out his arms nearly full length, as he read the postal asking me to tell how I got that wonderful yield of honey and increase.

“Yes,” I exclaimed, “I am very sorry indeed that I gave that report; and more so, to think I promised to tell how it was obtained, as it will not be of much account to the experienced; and I fear the beginner will get into trouble if he feeds outdoors as I do, especially if he has blacks or some of the new races of bees.” Now I will try to confine myself to the text, and in as few and simple words as I can, convey my thoughts. You must not ask me what kind of hive I use, neither what kind of bees; and above all, do not ask me to send you a queen, as I do not rear any for sale; past experience has proven to me I can not rear a good queen for \$1.00; if ever I do, I will advertise.

As I said in my report, I was badly reduced last spring, having only 16 colonies in all; 6 were strong—too strong to ship in safety, and the other 10 too weak to think of selling at all. Here comes the first *throb* that aroused me. Wife says, “I am so glad you have no more bees this spring to care for, with all your work and poor health;” then the neighbors would come along with such a grin! It *did* look lonesome when I took the last lot of bees to the depot.

I wrote immediately to a friend to send me some bees and queens, if he had them to spare. He sent me 5 pounds of bees, and I bought six queens to use before I could raise my own.

Right here let me tell you how many frames of comb I had on hand to start with. I had about 200 drone combs, 250 worker combs; these worker combs I used in building up nuclei, and for increase; the drone combs in upper stories for extracting.

Now for the *modus operandi*. Scrape out all the dead bees. I use no division-boards nor dummies in my hives; then close the entrance to the hives according to the strength of the colony; not with loose blocks, but with twisted paper, rags, or any thing that will make a cork. Remember, my bottom-boards are nailed fast to the hives. The weakest swarm's entrance should be just large enough for one bee to pass at a time, the entrance to the strongest, three inches by one-half inch. Next cover all the hives with strong paper, if you have not enameled cloth; over that put your sacking, quilts, or whatever you choose, and place on some kind of a weight to make it just as tight as you can. The weakest, I stop in every night; and if it is cold, leave them stopped up until it is warm enough for them to fly, even if it is for a week. Count the

spaces filled with bees between the combs, and mark it on the hive; this enables you to tell a friend just the strength of a colony without opening the hive. Do not open except when it is actually necessary; then close as soon as possible.

Next comes feed, to stimulate brood-rearing. About four rods north of the apiary is a small creek that has cut into the soft earth some eight feet deep, just opposite the apiary. Now *remember*, the bank that faces the south is almost perpendicular; here is where I do my outdoor feeding, when it is warm enough for the bees to fly. It is several degrees warmer here than on the level above, and consequently the bees start home warm with a *warm* load of feed. I fed about 250 pounds of old candied honey in the combs last spring in this place. If the combs of honey are put in the proper position it would warm up as soon as the bees would fly. I kept a box right beside the honey, with wheat flour in it, with some bran and fine straw on top to keep the bees from getting daubed. If the day gets too warm, shade the combs, or else the bees will carry the honey too fast. When it begins to get cool, drive them all out of the hives of feed and close them up for the day. This saves many bees that would get chilled and never return. Do not uncap the honey, for they will carry it too fast. When you run out of honey go to a hive that has plenty, and exchange an empty comb for a frame of honey. Water being close at hand, there is no necessity of supplying that. When bees begin to rear brood they require much water. When it is too cool for them to fly I sweeten some water quite sweet, and warm it up to about 130°. It will get cool fast enough. Raise up the quilt at the back end of the hive, and pour the water on to some of the bees. Have the front end of the hive a little the higher, so it will run back. You need not put water into the hive more than once in two or three days. You must use judgment about the amount to use; that will be according to the size of the colony, and how much brood they have in the larval state. Be sure to feed until honey comes from the flowers; and then if any thing should cut off the supply, *feed*. When the flowers secrete but little honey, and the colony is strong and short of honey, exchange an empty frame of comb with a colony that has plenty of honey, placing the frame of honey in the center of the brood-nest; if the hive from whence the frame of honey came is strong, place the frame of empty comb in the center of the brood-nest also; this requires judgment, or you may do a positive injury by chilling the brood.

I increase, as far as possible, by artificial swarming; that is, when a colony gets strong enough to spare a frame of brood, I draw it out and either give it to a weak colony, or take several other frames of brood from other colonies and form a new colony.

It is needless to use valuable space to go over the ground of queen-rearing, dividing, and equalizing, as I gave it last spring, and you should have remembered it until now. Clover yielded only enough to keep up brood-rearing before basswood came; when basswood came I found I had 20 colonies strong enough to box. These I put on sections and ran for comb honey. The next 20 were not so strong. These I gave an upper story supplied with empty combs, and ran for extracted honey. Then there were a few too weak to think of getting any surplus. Now and then I drew a frame of brood; these I took as often as they would have them to form nuclei, which I strengthened into good colonies, getting frames of

brood from any hive that could spare them. In this way I keep all hands at work. One of my neighbors has been watching me for the past two years, as he thinks of going into the bee business. He came over about the time I got off my surplus, and took a survey of the bee-yard, then asked me if I got much surplus. I took him into the honey-room and showed him. Says he, "There is not a man in the world you can make believe this, unless he has been with you and seen for himself from spring until now." WM. H. BALCH.

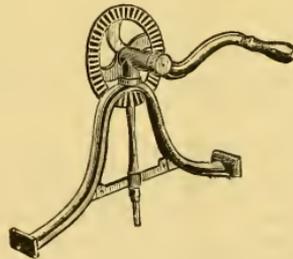

Oran, N. Y.

Friend B., your plan of having a feeding-ground protected from the winds, and exposed to the full rays of the sun, is an old idea, and is a very good one too, I believe, if you are careful to avoid inducing bees, by feeding, to come out in unseasonable weather. No doubt great things might be accomplished by pushing our colonies so as to get them powerful before the honey-crop comes. Your honey-yield comes late in the season, and this gives you a chance to get your bees built up strong in time to be ready for it.—It seems to me as though that "grin" of the neighbors was a pretty good thing in your case, was it not, friend B.? And this only verifies the little text, that "all things shall work together for good to those who love the Lord."

UPRIGHT EXTRACTOR-GEARING.

AN IMPROVEMENT IN THE CONSTRUCTION OF THE GEARING.

WHILE it seems to me by far the most convenient form of gearing is that which we have for years used on our extractors, which may be, for the sake of distinction, called horizontal gearing, there is still quite a number of the friends who insist on having the gearing stand upright so as to turn like a grindstone, as shown in the cut below.

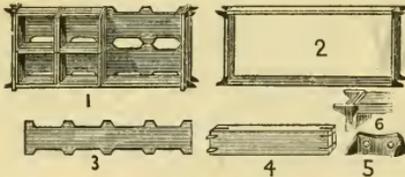

The gearing generally used for this purpose is that designed for churns, if I am correct, and a piece of wood has to be put across the extractor to hold it. The above we have had modified, so as to attach directly to the sides of the can, making it all metal, strong and light. The lower part of the upright shaft is made square, and goes into a square casting securely soldered into the upper part of the revolving basket. Extractors made with this sort of gearing will be 50 cts. more than our ordinary style; and where parties want just the gearing, as shown in the cut, for making their own extractors, the price will

be \$1.25 each, or \$10.00 for ten. It seems to me the upright gearing is unwieldy and unhandy. It is also awkward and unwieldy to ship, compared with the compact and simple horizontal gearing.

O. J. HETHERINGTON'S REVERSIBLE-FRAME BEE-HIVE.

THE MOST FEASIBLE REVERSIBLE FRAME NOW BEFORE US, AS IT SEEMS TO ME.

IN order to explain the arrangement of this new feature I shall have to ask our readers to imagine an ordinary Simplicity hive standing before them. Now, friends, you know that the great bulk of frames in common use are what are called suspended frames—that is, they are hung by the prolongation of the top-bar of the frame at each end. When I first made our metal corners for frames, I thought of having the rabbet at the bottom of the hive, and using the frame upside down. This would necessitate some sort of spacers to keep the tops of the frames at the proper distances from each other. We should also have to have the projecting arms of the metal corners short enough to go into the hive, for I hardly need tell you that the space between the ends of the frames and the end of the hive should not exceed $\frac{1}{2}$ of an inch; therefore these projections of the metal corners can not well be more than $\frac{1}{4}$ inch in length. The figures below show you how friend Hetherington manages it:

O. J. HETHERINGTON'S REVERSIBLE QUINBY FRAME, ETC.

2. Brood-frame, with metal corners attached to each corner.
5. Metal corners detached from the frame, showing nail-holes.

6. Metal corner in place, inserted in a saw-cut in the end-bar.

1. Metal corners attached to a wide frame, showing how it can be used without any top-bar.

4. End-bar of the wide frame, showing cuts necessary to take in metal corner.

In order to understand this hive we will suppose the Simplicity hive, before mentioned, has a strong rabbet of Russia iron at the lower edge of the end-board inside. This rabbet is simply a strip of Russia iron about $\frac{1}{2}$ wide, bent into a V-shaped trough. The longer edge is driven into a saw-cut, made diagonally in the lower inside corner of the end-board. When nailed securely it leaves a projecting edge of the iron $\frac{1}{2}$ inch wide, reaching into the hive, and upward, so as to just catch the arms of this corner. The frames sit in loosely, and go down until the arms strike this strip of metal. The upper corners have the same arms, as you see, to keep them away from the ends of the hive, and little points in the casting project outward and touch each other so as to space the frames from each other at both top and bottom. These metal corners (figure 5) are a fraction less than $\frac{1}{2}$ inches from extreme

to extreme. When ten frames are placed in a hive, there is a little play, as it were, which allows of a slight lateral movement. The stuff used for making the frames, figure 2, is $\frac{1}{4}$ inches by 5-16, all around. The end-bars are nailed through into the top-bars with long slender nails passing through the holes in figure 5. The saw-cut in the end of the end-bar as seen at figure 6 lets in the metal corner.

Now, I hardly need tell you that, with this arrangement, there is some difficulty in getting out the first frame when we wish to open the hive. To help us in this part of it, each story of the Simplicity hive has the upper half of one side made side opening. I may say here, that I do not like this side-opening arrangement; but I do not see how we could well get along without it. If even a part of the side to any hive is made to open, it very much impairs the strength and rigidity of the hive. The end-boards are at liberty to warp to some extent, thus pinching the frames, or giving them too much play. You will notice, that with this frame we have got to have hives pretty accurate, or the frames will pinch endwise, or go to the other extreme and slip from the rabbets. In fact, some of the frames pinch in the sample hive at hand, although this certainly ought to be remedied by accurate machinery.

Figure 1 shows the wide frame made on the same plan. However, as the ends and tops are close fitting, the lower corner has to be let in the middle of the end-bars. The figure will make this all plain, I think. You notice that friend H. dispenses with a top-bar entirely, which is certainly a desirable feature. He is enabled to do this by using separators, as in figure 3. These separators are about $\frac{1}{4}$ inch thick, made of sawed and planed pine, and are strong enough to hold the frame without the top-bars. This arrangement is quite ingenious, and pleases me very much indeed.

The question may be asked, "Why not make our hanging wide frames in the same manner?" The difficulty is in getting a strong support for these supporting arms, without any top-bar. You will remember we illustrated the plan for doing this by means of hoop iron a year ago or more.

A word more in regard to the movable side. This is held in place by what is called the Vandusen clamps, a cut of which we give here.

I find the price of these clamps given in Nellis' catalogue is \$2.00 per 100.*

*In the cut, the clamp is shown as it is used in fastening a bottom-board to a hive; and I may add, that friend Hetherington uses these clamps not only to hold in the movable side, but to hold the hive to the bottom-board, the cover to the hives, or a story to the one under it. Four clamps are used on each story, and two on each cover. In localities where high winds take off the covers, these are perhaps the simplest fastening that can be used. In our apiary, however, we have thought the time occupied in using them more than overbalanced the inconvenience of being obliged to go out after a storm and replace a few covers.

Do you want to know whether I would advise you to adopt this hive? I can only say it looks the most promising of any thing I have yet seen in place of the L. suspended frame, and I have thought enough of it to decide to transfer combs into some of the frames and try the hive in our apiary. You will observe that it accomplishes the matter of reversing frame, completely. Any brood-frame will go just as well one side up as the other. The wide frames can not be used either side up without putting in a top-bar.

In reply to a letter as to how long he had used the hive I have described, friend Hetherington replies as follows:

I have used the hive in its present form for four or five years. The hive I had been using was a closed-end Quinby, with a large case, modified a little from that used by L. C. Root and Capt. Hetherington, in that I had a reversible frame; an using it largely now. The only objection I have to it is, that when I want to sell any bees it is too expensive, and requires two men to handle it, so I got up this hive; and the more I use it the better I like it. When I wrote you I forgot to answer your question—that it is not the hive used by Capt. Hetherington and L. C. Root. The irons on the frames were got up by C. C. Vandusen, of Sprout Brook, N. Y. I made the length of the inside of the hive the same as the L. hive, so that by putting irons in the bottom edge of the end-pieces of any L. hive these frames can be used.

I have no drawings of the hive, and have no objections to your having some made, or any notice you may wish to give.

O. J. HETHERINGTON.

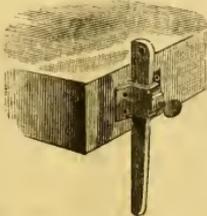

East Saginaw, Mich., April 12, 1884.

In answer to an inquiry to C. C. Vandusen, Sprout Brook, N. Y. I learn that the corners can be furnished for about 50 cts. per 100, and in large quantities considerably less. At present we have none for sale, and shall not keep them until we have given the hive a careful test in our own apiary.

AN IMPROVEMENT IN BUZZ-SAW TABLES FOR HIVE-MAKING.

RAISING AND LOWERING THE TABLE.

I PRESUME most of you have your table-tops to raise and lower in such a way that the table is fastened at different heights, as may be required, by a wooden slide and a set-screw. Well, we have experienced so much trouble in getting stuff wrong because the table-top slipped down a little, that Mr. Gray devised the following arrangement. The device is all made of cast iron. The part holding the thumb-screw is screwed fast to the framework of the saw-table. The part that slides up and down in this piece is of cast iron, and made tapering. It is hinged directly to the movable table-cover, as you will observe. Now, it can not slip down or settle, because it is wedge-shaped, and yet if the table is to be raised it can be lifted out any time, and then dropped right back into its original place.

SET-SCREW FOR BUZZ-SAW TABLE.

REPORTS ENCOURAGING.

FROM 4 TO 20, AND 3110 LBS. COMB HONEY.

AS I have just received the last returns for my honey of 1883, I want to tell you something more of my bees and their truly wonderful yield, and then I should like to learn through GLEANINGS if any others can give an equally truthful and large result for one year from 4 stands.

My former letters told that I had 3110 lbs. comb honey, or 777 lbs. per stand, spring count, and an increase to 20 stands. I find, on reference to the account, that on April 10, 1883, they had balanced the account, I having a lot of hives, etc.; since then I have spent \$15.60 for further supplies, and received for honey sold, clear of freight, commission, and all charges, \$255.30. I have sold 2 stands of bees for \$10.00; have an increase of 14, all in good order, and now on hand about 300 lbs. honey, besides having given away about 200 lbs. to my friends during the season. Most of my honey sold was No. 1 white comb honey at 18 cts. per lb.; and had I been an old hand at the business, my returns would have been much larger.

The bees are swarming already; but it rains so often the poor things can not get out to collect supplies, so I have to give them some full combs to carry on with.

Thousands of swarms are being brought into this county, and at the present rate of increase it will soon be fully stocked.

GEORGE HOBLER.

Hanford, Cal., April 15, 1884.

FROM 1 TO 7, AND 720 LBS. OF HONEY; ALSO FROM 9 TO 36, AND 1200 LBS. OF HONEY.

I commenced bee-keeping some years ago with varied success, sometimes getting as many as 25 colonies and plenty of honey, and, again, losing almost every thing. The spring of 1882 found us with but one colony, which we increased by artificial swarming to 7, and got 720 lbs. of extracted honey, and considerable comb honey, which we did not weigh. These bees all went through winter in good condition on their summer stands. Last spring I bought two box hives, which gave us nine colonies to start with. We increased to 36, mostly by natural swarming, and got about 1200 lbs., mostly extracted honey, during clover bloom. The latter part of the season was very poor, the bees making no surplus to amount to any thing. Two of our colonies starved to death about a month ago, but all the others are in fine condition, and raising brood nicely. We have them in Simplicity hives.

J. W. DROKE.

Hettick, Ill., April 4, 1884.

A BIG REPORT FROM CANADA, AND SOMETHING ABOUT HONEY FROM CANADA THISTLES.

We commenced with 30 colonies, increased to 102, and took 8500 pounds of extracted honey. From some of our best colonies we took from 500 to 600 pounds. We wholesale at 13 cts., and retail at 15. We have yet on hand 2500 pounds. Our bees did not commence to swarm till about July. I don't know about that old rhyme, "A swarm in May is worth a load of hay," and so on; for from some of our August swarms we took from 60 to 80 pounds of honey. There are a lot of Canadian thistles here, from which they got a good portion of it. Our apiary is 40 rods from the river Credit, which is almost hidden with basswood and yellow willow. They got pollen

and honey in the spring from the willow, which helped them considerably. ALFRED HAINES.
Cheltenham, Ontario, Canada, Feb. 28, 1884.

Friend H., when I read 8500 pounds from 30 colonies, I instinctively turned your letter over to see where such a report came from. If it had been from California, I should not have been much surprised; and, indeed, I was not very much surprised either when I found it was from Canada, knowing what great things your people did last year.

I took 265 lbs. comb honey from 3 stands last year, which encourages me to try again to get a start of enough bees to make it an object to attend to them. Goodwin, Ark. WM. MANNING.

THE FIRST NEW HONEY OF THE SEASON! WHO WANTS TO BUY?

I have more honey to sell. I have at this date 3000 lbs. extracted spring honey to sell. Can you give me a bid on it? If so, let me hear it. I am taking half a barrel a dry, and can't keep up with the bees. I can send a sample by express, if desired.

ANTHONY OPP.

Helena, Phillips Co., Ark., May 14, 1884.

Bees have generally wintered well here, although a great many went into winter quarters under rather unfavorable conditions; yet there has been a loss of only 6 colonies in 100. Bees were all well supplied with white-clover honey for winter stores, but a good many colonies were weak in numbers. Our bees were generally wintered on summer stands, with no other protection than banking up around the hives with snow. Bees are doing finely now, working on yellow willow and fruit-bloom, and the prospect is now good for plenty of early swarms, and a good yield of honey. M. L. STOLLARD.
Tarlton, O., May 5, 1884.

FROM 25 TO 41, AND 1621 LBS. OF HONEY.

I like to read the reports of others, whether they are of large yields, small yields, or of no yield at all. It gives us a chance to compare notes. I therefore send my report. I commenced season of 1883 with 25 colonies. Swarming commenced May 26th, ended July 27th. I let them swarm naturally. I work principally for comb honey. Took 1400 lbs. in sections, and 221 lbs. extracted, making 1621 lbs. Sold white for 20 cts.; colored, 18 cts.; extracted, 16 cts. for light, 12½ for dark, home market. Increase, 18 colonies. THOS. DECKER, 25-41.

Otsdawa, N. Y., April 24, 1884.

WHAT 2 LBS. OF BEES DID IN 30 DAYS.

When one has empty combs and hives, what is the cheapest way to build up an apiary? Last year from 2 lbs. of bees and queen, no brood, May 30 I built up 3 colonies in just 30 days, and all three colonies in good shape now. They came from Otto Kleinow, and I have ordered 15 lbs. to try it again this year. I shall probably raise my own queens this year. I think about 60 or 70 per cent of bees around here have died this past winter and spring. McBride, Mich., April 11, 1884. F. A. PALMER.

Friend P., you have evidently omitted something in the above report. If you divided the pound of bees into three parts, and gave each part a queen, in 30 days these queens might have a pretty good patch of brood; but it would be a pretty hard matter for bees enough to be hatched in that time to make a good colony of each. Perhaps

you mean that you did not receive any brood from friend Kleinow, but that you gave each one of the three divisions hatching brood enough to make three good stocks with what bees there were in the two-pound package.

REPORTS FROM THE NEW PERFORATED ZINC.

DO THE WORKER-BEES GET THROUGH IT?

WE have received one postal card, stating that the worker-bees did not get through; and friend Alley sends us one report, which we give below:

Dear Sir:—The drone-trap was received yesterday. On trial I find the holes in zinc are too small for my bees—Italians. Large numbers can not get through, and it seems difficult for nearly all. They pile up trying to get through. This trap, at least, would never do to put on to catch queens while swarming. E. E. EWING.

Highlands, N. C., April 30, 1884.

We also give the following from friend Alley in regard to it:

The above card came to hand to-day, and also a letter, making the same complaint. When the card came my bees were at work carrying in pollen, and I went and placed one of my traps having the new style of zinc in front of one of my largest colonies. I watched them for a few minutes, to see how it operated. At first they were bothered on both sides, but they soon discovered the holes in the zinc, and all went on as usual. My bees are as large as any I ever saw, and have no trouble going through the zinc, and the new zinc is good enough for me; so you may send me three sheets of the old kind and two of the new. HENRY ALLEY.

Wenham, Mass., May 7, 1884.

Of course, we have tried the zinc in our apiary, and the bees get through it very comfortably when they are not filled with honey, or laden with pollen. If the old zinc came pretty near restraining queens, it seems to me pretty certain that this new zinc would do it absolutely. Now, then, we are pretty near success in the matter of restraining our queens. The only drawback seems to be in hindering our heavily laden bees. Just at this point, friend E. C. Eaglesfield, of Poy Sippi, Waushara Co., Wis., steps in and sends us a model of a trap that sorts the bees as they go out, but permits them to go in without any restriction. It is simply a row of little doors made of very thin tin—tagger's tin, for instance, and these doors open inward only. When a bee comes with a load of pollen he just walks up until his head touches the door, which moves so easily that he goes right in, gives a buzz of satisfaction, and goes on. When he goes out he must go through the perforated zinc; but having dispensed with the pollen and honey, he gets through easily. This idea is certainly an ingenious one, and it has occurred to me that the slanting pins, such as our English friends use, and have been described in our pages, would do the same thing. And it seems to me it will not be very difficult to contrive so as to have the bees go out one place and come in at another. Drones and queens do not go out at all; but, if you choose, they can be made to go into a box by themselves.

LANGSTROTH, THE "HUBER" OF AMERICA.

THE following biographical sketch of our friend Langstroth, we copy by permission from the *American Apiculturist* for January. The editor has also kindly loaned us the engraving of friend L., which will doubtless prove interesting to many of our readers. The article has an additional interest, coming from our good friend J. E. Pond.

The beginner in bee culture of the present day can have no conception of the many difficulties that were met with under the "old box-hive and brimstone" style of management, or the almost insurmountable obstacles that presented themselves to the old-time amateur in an attempt to solve those mysteries which now are made plain as an open

self to garner in those facts which, when published and given to the world, opened a new field for labor, both intellectual and manual; and his work on bee culture to-day, as revised by his son-in-law, Mr. L. C. Root, stands out before the world as one of the best treatises on the subject which has ever been written.

Prior to 1852, the ablest bee-keepers of both the old and the new world were endeavoring to render the management of their bees more simple and easy, and many plans had been devised (none of which were really practicable) to enable the whole interior of the hive to be put under the complete control of the owner. Bars and slats of various kinds had been used to some extent; but still, although a great improvement, they were not just what was desired. The march of improvement in this direction was slow; still some progress was made; but not until

REV. L. L. LANGSTROTH.

book. True it is, that in days long gone by something had been learned in regard to the habits of the honey-bee; the methods of management then in vogue, rude though they were, still were productive of some little gain. The late lamented Quinby, a man of vigorous frame, possessed of rare intelligence, and an acute, active, and far-reaching mind, not only had shown that, even with the box-hive, and such rough appliances as he necessarily used therewith, one could, by close attention to the business, and by careful, intelligent management, bring about results that were fairly remunerative, but was one of the first to see and appreciate the value of the movable frame of Mr. Langstroth, and also to adopt and use it; by which use he encouraged and emboldened Mr. Langstroth to make his invention public, and thus aided in making apiculture what it now is, one of the leading industries of the world. Mr. Quinby also by close observation enabled him-

the Rev. L. L. Langstroth devised the sectional movable frame, and introduced it to public notice, was success made positive and certain; and with its introduction the doom of the old box hive was sealed, and brimstone relegated to its natural home.

Who is the Rev. L. L. Langstroth? is a question that is often asked by bee-keepers of this generation, and perhaps it may be of some interest to know something of his history.

Lorenzo Lorain Langstroth was born in Philadelphia, Dec. 25, 1810. As a boy he took great interest in natural history, and the happiest days of his youth were those spent in watching the habits of the various insects found in and near the city of his birth. His parents were of the old school, and, deeming such studies the height of youthful folly, gave him no encouragement therein; and it was not until the year 1838, that he began to learn something of the honey-bee. At that time he procured a colony or

two of bees, and began studying them under great disadvantages, he at that time never having seen or heard of a work on bee culture; and for the first year of his pursuit in this direction, the only published work of the kind that came to his notice was written by a man who doubted the existence of a queen-bee. After graduating at Yale College, he pursued the study of theology, and was settled over his first church at Andover, Mass. His health became in a short time so much impaired that he was obliged to give up his pastoral charge, and in 1839 he removed to Greenfield, Mass., where for a few years he was engaged in teaching. Finding that outdoor labor and exercise of some kind was absolutely necessary, he devoted such time as he could spare from his duties as a teacher to his apiary, and carefully verified all the experiments of which he had read, and entered into many of his own, for the purpose of gaining such knowledge by actual observation as might be useful to him or to bee-keepers in general. The methods of management then in use were not at all satisfactory to him, and he was constantly endeavoring to devise some way or means whereby complete control of the whole interior of the hive might be given him. He thoroughly tested bars and slats, and even endeavored to make a practical use of the leaf hive of Huber. This leaf hive, however, was too clumsy (as any one may learn by attempting to use one) and he became almost discouraged at the poor success he met with. At last the idea came to him, that if bees will build comb on bars set on top of the hive, why will they not build it in a frame hung in the hive? He tried this plan with fear and trembling. Failure had been his lot so many times, that he had hardly dared to hope for success with this his new fancy. As we all know, this experiment did succeed; and the result was, that in 1852 he introduced the frame to the public; and so well was his work matured, that the same style of frame he then devised is now used more largely than any other, in the exact form he first devised it, and by the ablest apiarists in the country. It will be needless to enter into the many discouragements and great opposition with which he met in his endeavor to bring his frame into general use. It has been introduced, and introduced fully and completely; and such are its merits that the Langstroth frame is now used wherever bees are kept.

By the term Langstroth frame, I do not mean simply the original frame he devised, and which he still advises; but do mean that all sectional movable hanging frames, by whatever name they may be known, are Langstroth frames.

It was the hanging, sectional, movable-frame principle, of which he was the inventor, and the so-called "Gallup," "American," "Adair," or "Bingham" frames (or, in fact, all hanging movable frames) are Langstroth frames.

As an inventor, the name L. L. Langstroth will live as long as bees are kept, and generations yet unborn will revere his memory. By means of his powers of invention, and through his instrumentality in putting that invention before the public, the apiarist of to-day, with a few days' practice only, is enabled to see and observe for himself all those mysteries of which Virgil has so beautifully sung, and which the various writers of the past were only enabled to find out, as was Huber, by long years of patient labor, such were the difficulties that then surrounded them. With the introduction of the frame, a new era began, and through its means bee culture

has been raised from a business of insignificance to one that is now barely second to any other. With the old box-hive, it was possible to gain 25 lbs. of surplus from a single colony in a season. When we compare this with the average of 150 lbs. per colony in many large apiaries, and with the 1000 lbs. from a single colony obtained by B. F. Carroll, we may well be led to assert, that Rev. L. L. Langstroth is a great public benefactor.

Mr. Langstroth was not only successful as an inventor, but also as an author. His treatise on apiculture, "The Hive and the Honey-bee," stands at the head of all written works on the subject, and has fairly earned the high distinction given it, of "the classic of apiculture."

Mr. Langstroth is now an old and feeble man. His health was impaired in early youth by too close attention to his studies, and now he is able to do but little for himself. For a few months past he has been in better health than for some years, and we hope his health will remain good, and he be spared for many years to give us, through the various bee-journals, the matured thoughts of his ripened mind.

Modest and unassuming in his manners, and confiding as a child in the honesty of the world, he today, instead of having reaped a fortune as the result of his valuable invention, is not worth a single dollar. But for all this, he stands before the world as one of Nature's noblemen, an honest man. He has fairly and fully earned the proud title that all bee-keepers, who know him, admit belongs to him, — the prince of apiarists: the Huber of America.

Foxboro, Mass.

J. E. POND.

REVERSIBLE FRAMES.

HEDDON'S "REVERSED" OPINION IN THE MATTER.

SINCE I wrote my article for the April No. I have slept, dremp't, and laid awake over the subject considerably; talked with friend Vandervort and several others who have had so much experience with bees that they can almost tell exactly the result of an experiment before it is put to practice. I have been forced to "reverse" some of my opinions, and I am now persuaded that Bro. Howes (see page 304) has got the "bulge" on us all.

Now, Bro. Root, I want to bet you a cake of maple sugar (a 5-cent one), that if reversible frames come into general use (and I almost believe they will), that the plan of Bro. Hetherington's that you speak of, will not be the best and the one generally used. It is just what I advocated in my April, mistaken article; that is, reversing the whole hive at once. Now, Bro. Howes will soon learn that I was not poking fun at him or Mr. Baldrige, for he will see that the "Reversible Hive" presents attractions enough to make it a competitor of the reversible frame. But in the end I am fully persuaded it will be left behind in the race.

Since my former article, I have made several reversible hives, which are now piled up in my wash-room, and I suspect, after reading Bro. Root's editorial, that one of them very nearly resembles Bro. Hetherington's. It consists of a plain Simplicity case into which we place 8 brood-frames made on the same principle as is a common open top and bottom all dovetailed section, the top and bottom bars being $\frac{3}{8}$ wide, while the end-bars are $\frac{1}{2}$, and close fitting. The Simplicity case being $\frac{3}{4}$

of an inch deeper than the frames gives a $\frac{3}{4}$ space at top and bottom, or both over and under the frames. I had several methods for holding these in position, a part of which I made, but none of which may be just like Brother Hetherington's, and none of which I will use room to describe. I also made a hive on the Bingham plan. I made it a little deeper and shorter, used a bottom-bar as well as a top-bar, both being just alike; allowed the end-pieces of the frames to extend $\frac{3}{4}$ above and below the top and bottom bars, and clamped them together on the tight-end-fitting plan, with the loop wire and key, as invented and used by Mr. Bingham. I also made upper stories of wide frames to hold sections, which were clamped together in the same manner.

Now, all this works pretty well, and looks quite practical. The progressive bee-keeper naturally relishes and is strongly attracted toward a change; something new; something which he hopes is better, all points considered. Just here is where we get caught, unless we are wary, or ever on the alert. We take the blessings we have been enjoying, as an every-day matter, of course. What we have biggest in our eye is another, and brand-new advantage. We become so eager to gain it, that, almost before we know it, we trade off two or three old comforts for one little new one, and never realize the mistake until we begin to miss the old advantages in actual experience. Now, what is the advantage in my last month's article, and Bro. Hetherington's plan of reversing the whole brood-chamber at once? It is this, and a good one too: It saves time, it does not necessitate so complete an opening of the hive. This is good, and can not be denied. This is the idea that first caught me. Now, so far as I can see, this is all. Let us see what advantages there are to be enjoyed by having each frame reversible, that are not enjoyed by the reversible-hive plan.

1. We preserve that valuable advantage, "laterally movable frames." 2. That ease of manipulation, and freedom from complication, which the hanging frame has as compared with the close-fitting, or Bingham-Quinby style. 3. A tight bottom-board, which is a great comfort when moving hives for any purpose whatever, closes out all lodgments for worms, and makes the hive many times stronger and more durable. 4. Upon the reversible-frame plan, the new style of frame will ever be interchangeable with the standard Langstroth frame.

It may be argued, that Bro. Howes' frame is expensive. This is true; but it need not be, as I will show you in the future.

Brother Doolittle certainly deserves the thanks of the honey-producers of this country for his protective article on page 306. Sooner or later all must see this point; some, as an abstract principle; others, not till they feel the sting of ruinous, overstocked prices. We the producers are the support of the journals. Why are they not willing to protect us?

JAMES HEDDON.

Dowagiac, Mich., May 5, 1884.

Friend H., you make a good point in that paragraph where you speak of trading off two or three old comforts for one little new one. The same thing has been done in bee culture a great many times, especially in the matter of feeders, and also in various kinds of frames and hives. What a medley of frames have been in use, and how invariably, almost, they have been swapped off, sooner or later, to go back to the old frame!

I like new things as well as anybody; and may be I am a little swayed by that same old besetting sin, in my description of Bro. Hetherington's hive on another page. This hive, also, has the lateral movement of the frames, at least to a certain extent. The frame has *not* the ease of manipulation of a hanging frame. The bottom-board is secured, but is not nailed permanently to the hive, although the lower story might be made in that way. These hives could be used interchangeably with Simplicity and L. hives, I presume, but we could not have both kinds of frames in the same story.—I supposed our bee-journals were published for the express purpose of supporting and protecting honey-producers; or, if you choose, for considering their best interests.

SOME HELPS TOWARD THE SALE OF HONEY.

AN IMPROVED HONEY-STAND.

OUR friend W. B. House, whom many of you may remember, has been, for several weeks back, at work revising the A B C book. It is being revised pretty much all the time, for that matter; but just now we are adding a good deal of new matter, and quite a lot of new pictures. Below is an improvement on the honey-stand of friend Williams, which we illustrated a year or more ago. We make the carved ends of black-walnut. The shelves are some cheaper wood with a strip of black-walnut along the front. The back is made of cheap wood, stained in imitation of walnut.

AN IMPROVEMENT ON FRIEND WILLIAMS' HONEY-STAND.

Of course, our friends can vary the design as much as they choose. The honey-stand makes a very pretty ornament to set up somewhere in your home or in your honey-house, especially if you have any sort of a trade in honey. The jars and pails are all ready to hand over to a customer, and you can do the filling and all that kind of work when you have no customers around. The paste-board box in the center of the upper shelf has proved a wonderful help to us in selling comb honey. It comes so natural to hook your little finger inside that little loop on the

top, and walk off with it, that people will buy it when they wouldn't invest in honey otherwise. I think our engraver has got up a rather pretty picture, don't you? By the way, if you are dealing in implements and supplies, perhaps you can make such stands as the above during your idle season, and have them ready for sale when the honey business opens. A bee-keeper ought never to be obliged to say he has nothing to do—no, not even on rainy days, or in the fall or winter time.

The prices of these honey-stands will be the same as the old style given in our price list; namely, finished complete, lettered and varnished, \$1.00; ten for \$7.50. In the flat, 60 cts.; ten for \$5.00. You can judge from the above price whether it will be cheaper to make them or buy them.

SOME SUGGESTIONS IN REGARD TO REARING NICE QUEENS.

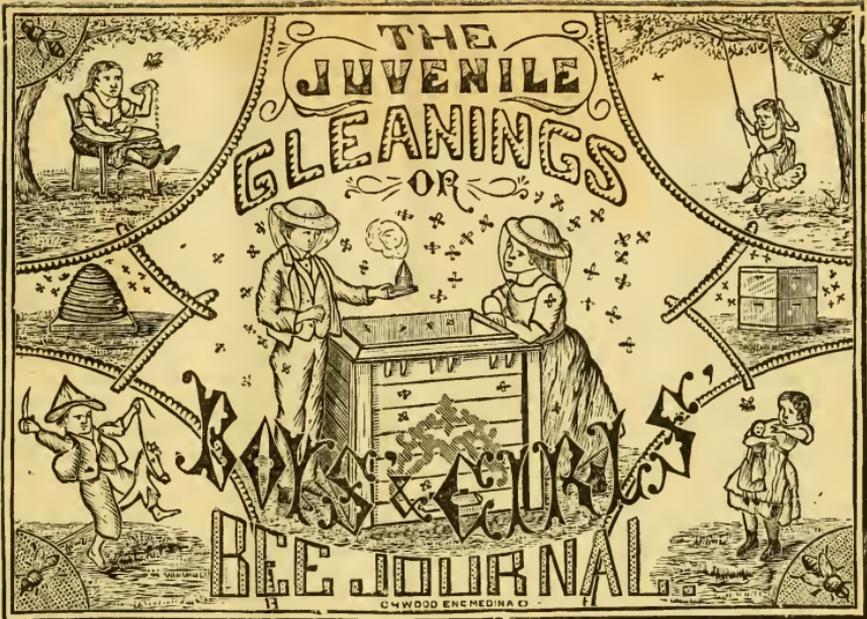

COMMUNICATED VERBALLY BY D. A. JONES.

I PRESUME that the friends will be glad to know that friend Jones has been paying us a visit of a few days. Of course, we have had many talks in regard to bee-matters, and one of these talks was about rearing nice queens. I will try to give the plan as he described it to me. In the first place, he believes in having queen-cells built in powerful colonies. How shall we get a powerful colony for the purpose? A good many would say, "Put in brood." "Not so," says friend Jones. Many colonies have as much brood as they can take care of already. If you put in more, you are going to overstrain their powers in trying to feed a larger quantity, and the consequence is often a loss, where they would have been all right if left alone. Have any of you had experience in this way? Well, our friend John (one of our young Canadians, you know) suggested that we put in hatching brood. But it is difficult to get hatching brood without a good deal of unsealed brood and eggs as well, therefore our strengthening up has to be done by giving the colony young bees. Get these by taking some frames from a populous colony; and by tapping them, get all the old or mature bees to fly off. To get rid of all the bees that are able to fly still further, shake them on a large newspaper, or several papers, in front of the hive you wish to strengthen. All the bees that can fly will soon go home. After these white downy bees have collected in a cluster on the papers (because they do not know where to go), take a small brush or feather and start them into the hive. Any hive will receive these bees, and they rarely if ever molest the queen. Get your bees from all over your apiary in this way till your queen-rearing hive is boiling over and ready to swarm. Under the swarming impulse they will start queen-cells in great numbers, especially if they have a dash of Holy-Land blood. If they swarm, take away the queen, and let them go back, then they will build cells with a caution. Ordinarily, you know, the first queen that hatches destroys the other cells. Friend Jones says, that with this over-populous col-

ony under the swarming impulse they will not do so. Most of you have seen a lot of queens all hatched out at once, in a strong colony. With Holy-Lands I have seen young queens flying all around, crawling over the combs, making things lively generally. I suppose many of you have seen something similar.

Well, now, here our young queens hatch out in a full colony, just like queens hatched out in a lamp nursery, or better, if you think so, for you can put them in nuclei ready to receive them, or introduce them to queenless colonies. If you keep track of the hive, you can, a great many times, cut out queen-cells where the queens are just gnawing out. As Holy-Lands often hatch a dozen queens or more inside of an hour, we can often get a pretty good lot by being on hand and ready to care for them. If you want to see queen-cells beyond any thing you ever knew of before, just use all these young queens, and let this over-populous colony, having all young bees pretty much, start in on a second lot of cells. If they have this Holy-Land dash, as I told you, they will often build the queen-cells so thick together as to look like drone brood. Of course, we can not well cut the cells apart; but a little care to be on hand when they hatch will often give us a quantity of robust young bees ready to fly the minute they leave the cell, that will bewilder and astonish one who is unacquainted with this method. The young bees, to do the work, need to be Holy-Lands; but the brood furnished them for rearing queens may be Italian or any other race you choose. It is taking advantage of the natural swarming tendency somewhat, as you see. I believe we had a report last season of a lot of queens reared in a similar way, that came out and flew around in such plenty that they went into adjoining hives, right and left. The plan is so much in accordance with the natural habits of bees, I presume, that nobody will raise any objection to it. The tendency to swarm out may be the most difficult part to manage.

Friend Jones says taking away the old queen from them will stop the swarming, and it is generally laid down as a rule. I believe, that bees never swarm unless they have a queen to go with them. Well, now, although I have never had a case that I know of where a swarm went out without a queen, or, at least, where there was a queen in the hive, that tried to go, I believe we have had several reports where they did this. I think friend Doolittle said his bees swarmed out without queens one season. When the young queens hatch out they will often lead out a swarm, and sometimes a swarm will break up in little bunches, each bunch having a queen. If they do, let them do so, and make nuclei of these little swarms. If a large swarm goes out with one of these queens, give her enough bees to form a nucleus, and send the rest back home, for they will always go home if their queen is taken away. I say they will *always* go home if their queen is taken away; but there is one chance of a mishap. If another swarm should come out having another queen, they would unite with this swarm.

• He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

MYSELF AND MY NEIGHBORS.

And God said, Let us make man in our image, after our likeness: and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth.—GEN. 1: 26.

I WONDER, little friends, if it is warm and sunny around your home as it is here. Is the grass green, and sparkling with bright yellow dandelions? and are the bees humming merrily in the opening fruit-blossoms, so that even the horses and cattle and sheep and chickens, and the dogs and cats too, are rejoicing and happy? Is it not a grand thing to have cold icy winter a while, just so we can appreciate the glorious beauty of spring? Well, perhaps two months ago, one morning when I started over to breakfast it was raining and freezing. It did not look a bit as it does now. As I passed along I noticed a poor forlorn-looking cat that had been out in the rain and snow until she was wet and cold. As I looked toward her she gave a sort of sorrowful mew, indicating that she did not feel happy, just that cold icy morning. Of course, my first impulse was to say, "Poor kittie!" and I stretched out my hand toward her; but she backed off, wondering, evidently, whether I was not of the kind of people who played tricks on cats by making believe I was kind and friendly, only to turn about and scare them out of their poor little wits. I talked to her soothingly, and I remember wondering whether I was equal to the task

of disarming her prejudice toward the cold world.

I have been told that I have a faculty of disarming almost anybody, if I can get a chance to talk with them. I have told you something about disarming horses when they get stubborn and ugly, and bent on mischief. I did not succeed enough so that I could pat her with my hand: but she was in so poor a plight, and felt so miserable and forlorn, she probably concluded she could not do much better than to follow the only kind voice she had heard that morning, anyhow. She followed after me, mewing plaintively up the stone walk, and up on to the porch. She caught a glimpse of the warm stove, and doubtless smelled the preparations for breakfast. She couldn't quite overcome her scruples sufficiently to come in, though kindly invited. Mrs. Root gave me a bit of meat, and I managed to get her to come and stand on the porch while she ate it, and Huber opened his blue eyes, looked at his papa, and then at the cat, and gave one of his inquiring grunts. I can't spell it in letters, but it was something like "eh?". Papa told him it was a poor kitty that was wet and cold and hungry, and he put out his little fat hand, and asked a great many questions, evidently having his sympathy aroused because mine was. I do not suppose you could understand his questions; but his papa was very much edified by them.

After she ate her meat she went off down the walk again, and I thought no more about it until some of the hands were making re-

marks about a "tramp cat" that had been seen around in the factory. Pretty soon I caught a view of the tramp cat, and it was my acquaintance of the morning, sure enough. When there were nothing but strange faces all around her she gradually sidled up toward me, thinking, doubtless, that, as I had given her the meat, it would be about as safe to trust to me as anybody; and it was not long before she came up and sat on my lap while I read the letters, purring with intense satisfaction to feel that she had at least one friend in this cold icy world. I had talked kindly to her, and had fed her when she was cold, and was not that enough?

During the day she went out around, foraging about; but between five and six in the morning, when I was reading my morning mail all alone in the office, or pretty nearly alone, she was my company. I would see her during the day in different parts of the factory, peering around in the dark-room, looking behind the cans of maple molasses, and the barrels of counter goods and glass-ware. It seemed to me as if she felt grateful, and concluded the best way of repaying would be to look up the mice, and take a general oversight of things. I need hardly tell you that cats are very necessary helpers in our factory. The mice would not only get into our flour and eatables, but they would go into our seeds, papers, and make sad work in a hundred ways, if it were not for the cats; and yet for some reason I have hard work to make the boys remember this, and treat the cats kindly.

Not many months ago one of our cats was blinded in one eye. On inquiry I was told that some of the boys in the tin-shop threw things at them when they came around, and that was the way this one got an eye put out. Are you ever unkind to kitties, my friend? I know it is sometimes necessary to have cats killed, or got out of the way, when they become so numerous as to be intrusive; but, dear friends, this should be done with kindness and love for the poor dumb brutes, and with as little pain as possible, should it not? I know some of the boys thought we had cats enough, and regarded this new tramp cat as an intruder. Perhaps they laugh at my weakness in befriending tramps of all kinds, or, at least, of giving them a chance to prove themselves worthy of help and assistance. As a rule, I am pretty fierce against tramps in the human family, and they do not often get a bite to eat, either at the factory or at the house, unless they go to work and earn it in some way.

Well, after the new cat had been around a week or two, I noticed one day that she was dragging herself around as though almost unable to walk, and I made several inquiries as to who had been so unkind as to harm our new friend. I did not find out for some time; but finally I overheard and guessed enough to get at the following. May be I have not got it just right, for I do not like to go questioning around about others; but I think in substance it was about like this:

After kitty had looked over the factory pretty thoroughly, to see there were no mice anywhere, she wandered into the out-buildings, and finally across our branch railroad

track into the old station-house, or freight depot. A couple of grown-up boys saw her in there; and thinking it would be a good idea to "have fun" with a "strange cat in a strange garret," they armed themselves with clubs, or bits of boards, and began to chase her. Poor kitty! Perhaps she had begun to imagine that humanity is kind, after all, and that people are not wicked and blood-thirsty; but now with yells and great clubs she was being persecuted and pursued, first behind one pile of boxes and barrels and then another. Blow after blow came, even though she had offended nobody, and did nothing at all out of the way, until, wounded and bleeding, she dragged her poor suffering body under the porch or into some place of refuge, to lie down or die, or possibly recover. The boys, of course, had a big time; for if they did not succeed in killing her, they "broke both her hind legs, any way," and seemed to think they had done a very commendable thing in having accomplished so much.

Dear friends, during these last few years a great society has been formed for the prevention of cruelty to animals. Horses and dogs have been cared for, and made happy; but what has been done for poor kitty? but more than all, what has been done for our grown-up boys, to teach them to love not only humanity, but to love the poor dumb brutes God has placed about us? The little story I have told is exceedingly boylike. Such things often happen anywhere. But may God help us to educate our youth in a different way!

In a recent Sunday-school lesson we had the expression, "Charity suffereth long, and is kind." Do you not think, friends, this kindness should extend even to cats and dogs? Poor kitty seemed to have more of the virtue of charity than we often see in humanity. We read in the above chapter, "Charity endureth all things."

I went up to poor kitty as she lay licking her wounds on top of a barrel. She mewed plaintively, but seemed to cherish no hard feeling, and had nothing laid up. She even purred in gratitude when I stroked her with my hand, and in a philosophical way seemed to pass the matter by as only a part of this world's experience. I have thought several times of talking to these young men. I have wondered how I could present the matter in such a way they would not feel unkindly toward me, and yet realize what a wrong thing it is to torment poor and defenseless brutes. The matter has been much on my mind; and when I realize the amount of suffering and pain that has been inflicted in this careless sort of way, there comes a great welling-up from my heart, "Lord, help! Lord, help!"

I have told this little story, friends, hoping that some boys might read and ponder over it, and declare they will never more be guilty of frightening a poor kitty, to say nothing of hurting them by cruel blows. They are God's creatures, and we are his children; for do you not remember in our opening verse,

Let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth?

SOMETHING MORE ABOUT GRANDPA LANGSTROTH.

MRS. HARRISON GIVES US A PEN PICTURE OF HIM AND HIS HOME.

WELL, children, Daniel Webster used his eyes at the convention. Didn't he? I wanted to have a chance to talk more with grandpa Langstroth, so I offered to be his *beau* to go to dinner. I don't see any reason why a woman can't bear an old gentleman, do you, provided she is strong enough, and has money enough to pay for the dinners? So we started across the street to the restaurant. Grandpa had his cane in one hand, and I took hold of his other arm. When we got there we sat down at one of the little tables, and had to wait for it be cleared up; and while this was being done we talked. He said he had two married daughters, and one had seven children, and the other had none. Guess which one grandpa lives with.

He said his grandchildren were a great comfort to him, and he pared with knife, apples and other fruit, and cut it up for them. His little grandson, three years old, sleeps with him on the east side of the house; and one morning he looked out of the window and saw the sun, round and red, and he said, "Drampa, tut up that bid sun, and div me a piece of it."

I wanted, after dinner, to have grandpa go up in the cars with me to Farwell Hall; but along comes a bustling little man with short legs, and he holds up his head so as to see through his gold spectacles, and says, "Mrs. Harrison, you are not going to have Mr. Langstroth go up town with you." So Mr. Newman took him to his house for a rest and an nap, as he had a cold.

Are you not all sorry that grandpa has been sick so long? And won't you pray God to make him well again?

LUCYDA HARRISON.

Peoria, Ill.

Thank you, Mrs. H. It seems to me I could see you and our old friend going across the street, and sitting down at your little table, and I know exactly how he looked when he told that little story about one of the grandchildren: I think I shall have to tell here a little story he told me in Toronto. He was speaking about the significance of that expression so often used in the Bible, "Milk and honey," and he remarked that, when any one is made sick by eating new honey, a good drink of milk will always cure it. You know I always like a pitcher of milk when I have bread and butter and honey. Well, last spring when new honey began to come in at friend L.'s home, they all wanted a taste of it; and when some was put on the table they ate quite freely of it, especially the children. Before going to bed friend L. said he felt some distress from eating so much honey, and so he took a drink of new milk. On the way up stairs to his bed he met one of the little ones, probably the same one whom he speaks of, who wanted to "tut up that bid sun." The little fellow was in his night dress, and was coming down stairs with a doleful face, rubbing his little stomach, and saying,—

"O drampa! I dot tummy ache. I dot tummy ache."

Good old grandpa soothed him by his voice, and took him kindly by the hand down stairs,

gave him a good big drink of milk, and all was well. Now, little friends, when any of you get the "tummy ache" from eating too much honey, just remember grandpa's remedy, and let me know if it cures you as it did little —; and, by the way, that reminds me that grandpa has never yet told us the name of his little bed-fellow. We want to know more about those grandchildren. Will not good friend Cowan tell us something about them? May be one of them will write for the JUVENILE, and tell us about grandpa while he is too sick to write himself.

THE DISCOVERY OF SILK.

COMPILED AND WRITTEN BY MISS NELLE LINCOLN ROSSITER, PRACTICAL SILK CULTURIST,
6054 VINE ST., PHILADELPHIA, PA.

Continued.

IT was reserved to the great Henry IV. to introduce the culture of silk into France, at the beginning of the seventeenth century, and it constituted one of the splendid epochs in the history of that kingdom. Olivier de Serres was the most instrumental in this new acquisition, and the French call him to this day the patriarch of agriculture. In the year 1600 he published a book entitled "Theatre d'Agriculture et Mesnage des Champs," by which light, as it were, succeeded darkness in rural economy; and it was read with so much eagerness that thirteen editions were printed within a short space of time. This success, however, he chiefly ascribed to the excellent king and to his wise minister, Sully, who were the first to view agriculture in all its important relations, and gave to France the Blessings of a "golden age."

"In presenting to your Majesty the Theatre of Agriculture and Management of fields, I do but call your attention to your own affairs." Delighted with the book, the king honored the author with a most obliging letter, written with his own hand, and desiring him to come to Paris. Olivier left, with great regret, his fine estate, in 1601; though he could not disregard a call which tended to make him more active for the good of his country. Scarcely arrived at Paris, he received the greatest distinctions; he soon became the confidant and adviser of the king, and of Sully; and wise laws and regulations concerning agriculture were enacted. The king offered Olivier the highest honors; but he asked one favor only: That all useless trees might be banished from the royal gardens. When this was granted, Olivier went to work with such diligence that throughout the kingdom the measure was executed within a short time. But this was not enough for his patriotic zeal. Upon his recommendation, 14,000 mulberry-trees, and a great quantity of seed of the same tree, were ordered from Italy, to supply the vacancies intentionally made in the royal gardens. In later times, he procured, also, from Italy, silkworms' eggs, and acquainted people with their rearing. The trees, the eggs, and a printed instruction, respecting their use, were

* From such impulses the good king used to say, that "each peasant ought to have daily a chicken in his pot," and hence the eager search after talented men, and the favor-shown to them; the facility with which Sully extinguished, in the space of ten years, the public debt of two hundred millions that had been accumulated during the war; the surplus of thirty millions, which the treasury possessed, ten years later; the general welfare throughout France; and, finally, the encomiums bestowed to this day upon the great monarch and his truly great minister.

distributed, gratis, to agriculturists, and the new industry was particularly recommended to the fair sex. Well, therefore, may Henry and Olivier be called the creators of the culture of silk in France.

The most singular feature of this innovation is, that the king did contribute more to its introduction than any of his ministers. Him alone was Olivier able to convince of its utility. He failed with Sully, who generally acted with great wisdom, but who, upon this occasion, was directly opposed to salutary advice. It is curious to find the remarks, to be found at the conclusion of the 16th book of Sully's Memoirs. I shall not omit to mention here what was done in France, in the year 1633, in regard to manufacturers, and especially those of silk. Henry, who embraced with ardor every means to increase the welfare and glory of the kingdom, suffered himself to be persuaded that nothing would be easier than not only to become independent of foreign countries, in regard to the fabrication of such silk stuffs as are imported into France, and which the French were accustomed to procure from a distance, but to make them serve as an important branch of the national trade. Nothing more was necessary for this, it was said, than to promote the rearing of silkworms, the plantation of mulberry-trees, and the building of houses appropriate for this species of manufacture.

A LEAF FROM THE LIFE OF AN ORPHAN.

ALSO SOMETHING ABOUT THE BOOK OF BOOKS.

WHEN Sarah Paxon was quite young her mother died. Sarah was, therefore, left to the care of her two grandmothers. Now, these two old ladies were very good when surrounded by proper influences; but, like the chameleon, they sometimes changed their colors. One of these grandmas wanted the waif, and the other was determined to have her; and Sarah, being too young to have her say, let them have it their own way. Grandma Lorraine having possession, took care of the child in her own style, which was exactly opposite from the style of grandma Paxon. So the latter lady devised a plan to "turn the tables." Sarah's father was to aid her by getting the child, under pretense of taking her to church—grandpa Paxon to be at the door of the church to receive her.

In this way Sarah got a new home. Grandpa Lorraine returned this compliment of grandpa Paxon's on his death-bed, by bequeathing poor little Sarah but fifty dollars instead of the one thousand which should have been hers.

Innocent Sarah grew from babyhood to childhood, and partially reunited the two families; but she was early twitted about her fortune. The Paxon's would laugh at her, and the Lorraine's ask her what she intended to do with her estate.

At the age of twenty Sarah left her girlhood home to become a wife, and in one more year she stops at a furniture store and spends fifteen dollars of her fortune for a cab for her boy, and the rest of her cash she divided out as follows: Ten dollars for a dress, seven for a porker, and the rest for sundries. The cab soon went to staves. The dress wore out, the pig turned into lard, sausage, side meat, etc., and that was the end of poor Sarah's wonderful fortune. Now, don't you think if she had bought some

bees she would have been as well off—perhaps hundreds of dollars ahead? Sarah has made a great many mistakes in life, and she has found experience to be a dear teacher. She thinks it cheaper to follow good advice than risk her own judgment. She likes the advice she finds in GLEANINGS, especially the Home Papers; and when she finds nothing to suit her case there, she has found a most wonderful book which is a sure guide-book for every case that can be recorded. Brother Root may sometimes make mistakes; but there is absolutely no risk in risking this Book of books. E.

Thank you for this sketch, my good friend E.; and may God be praised that we have that Book of books, that safe counselor, within the reach of every poor mortal! And may God help us to remember that there is absolutely no risk in taking this book for our guide.

BEEs, WHISKY, AND TOBACCO.

A JUVENILE LETTER AND SOME JUVENILE POETRY.

WE are located on a beautiful stream in the far West, 100 miles from Seattle. We are putting up a saw-mill this season. The flowers are all commencing to bloom. One can stand on the snow and pick flowers.

The ground doesn't freeze here. There is an abundance of flowers here in summer, and I think it a good place for bees, although there are none in this vicinity yet. Bees are very useful; and as soon as we can get any near enough, without being killed on the way, we will have some. Every time I look at John's dream of the toad, mauling the bee with a spiked club, I have to laugh.

WHISKY.

Boys, keep away from the saloon,
Or a drunkard you will be too soon.

You will be degraded,
And your name will be faded;
Your folks will be disgraced,
And you never will be trusted.

I had rather be a slave
Than to go a drunkard to my grave
If you are asked to take a drink,
Just stop a while and think.

How dare I be so low,
And give the answer no!

TOBACCO.

Tobacco is a filthy weed,
Never known to be in need.

When the dirty weed gets ripe,
It's most ready for the pipe.

When you get a pipe full smoked,
Think how often you have choked.

I will say in my highest tone,
Everybody, let the weed alone.

I'll not charge you any price,
If you'll just take my advice.

J. D. SEATON.

Ellensburg, Kittitas Co., W. T., March 26, 1884.

Friend S., I do not see why bees won't prosper in any locality where the ground does not freeze. We have made several shipments to Washington Territory, and, if I am correct, we have had some pretty good reports.—So you liked the picture about John's dream, did you? Well, friend S., I will tell you, confidentially, that there is some talk of having Mr. Merrybanks and his neighbors all in a nice little book. When I used to write it every month it came in such disconnected portions that our little friends, and some of the older ones, did not recognize it as only a story. If it is all in a book by itself, perhaps it will sound better. Thanks for your poetry.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT USUALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, SHEEP OIL, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chief's among ye takin' notes:
An' faith, he'll prent it."

A GOOD many messages for Huber come in these little letters, and one little girl asks me to tell more about him. Well, he is now almost a year old, as you may remember, and he goes all over the house, and would go up stairs if not watched and stopped. He soils his clothes so much that his mother has made him a creeping-skirt, but I call it his "overalls." It is lucky he has overalls, too; for a few days ago he slipped off and crept into the pantry. As his mother was very busy, and as she thought she had put every thing away up high, she concluded to risk him there awhile. He was very quiet and still for some time, and finally she thought she heard something that sounded like eggs. What do you think? He had got the egg-basket and picked out the eggs one by one admiringly, and put them in his lap. Then he thought he would put them back in the basket again; but as laying them in carefully was too slow business, he just tossed them in. We had plenty of eggs for supper, and mamma didn't have to go to the trouble of breaking them. He daubed eggs all over his face and hair, and all over his clothes. When found, he was gazing at his fat fingers daubed with white and yellow, and then he tried in vain to pick up the yellow and put it in his juicy little mouth.

Next day he got a plate of comb honey; and after he had fed himself, baby fashion, he experimented by getting a handful of honey, and then opening and closing his little fist. Yesterday he made another voyage into the pantry, and managed to reach the coffee-mill. He pulled the drawer out; and when his mother found him he had just finished sifting the ground coffee pretty evenly all over the floor. He can neither talk nor walk yet; but if you should see him when he first gets sight of his papa, you would readily believe me when I tell you that he succeeds pretty thoroughly in making everybody understand what his wishes are.

He already loves the honey-bees, and I can not tell which would set him wild quickest—to say to him, "Go see bees with papa?" or "Go see the great big engine, and see wheels go round, round, round?" Now, then, little friends, I have told my story, you go and tell yours.

KITTY'S REPORT OF HER PAPA'S WINTERING.
My papa keeps bees. Last winter he put away 70, and lost about one-third of them.

KITTIE M. BARGAR.
Border Plains, Webster Co., Iowa, April 15, 1884.

3000 LBS. OF HONEY FROM 37 HIVES.
Papa has 37 hives of bees. We got over 3000 lbs. of honey last summer. I have a little brother three years old. He got stung last summer under his eye.

CARRIE SHEERES.
Clarksburg, Ont., Can., March 15, 1884.

CHARLEY'S LETTER.
The willows are in bloom, but it is so cold that the bees can't gather any thing. It is raining all the time out here. Pa fed the bees rye flour, and they gathered it up in a hurry. CHARLEY NELSON.
Danforth, Ill., April 21, 1884.

HOW TO MAKE RUSTIC BEE-HIVES.

My brother keeps bees. He has three swarms. He lost two this winter. He made two hives; they look like log houses. They are rustic work, and look very nice. He buys his goods of E. T. Flanagan, and he says he would buy from no other.
Webster Grove, Mo., Apr. 23, '84. MARY STAHL.

FROM 1 SKIP TO 10 "SKIPS."

My grandpa gave me a skip of bees, and they increased to 10; they make a good deal of honey from basswood. I help make wide frames. Mamma says God says he gave six days to labor, and the seventh day to rest. THOMAS H. WILLIAMSON, age 10.
Covert, Seneca Co., N. Y., March 17, 1884.

JOE'S REPORT.

My mother has 15 hives of bees, and has sold two, and I have two of my own, but have had no swarms yet. My father doesn't like to have any thing to do with bees, but likes the honey mighty well.
JOE B. GREENE, age 14.
Birmingham, Ala., Apr. 20, 1884.

THE WAY CHARLEY EARNED HIS SWARM OF BEES.

I promised to let you know how I got my colony of bees. They belonged to mamma. She gave them to me for helping her last summer. I help her wash dishes, mind my little brother, and many other things. CHARLEY A. SEABRIGHT.
Blaine, Ohio, April 25, 1884.

THE WAY ROSE'S PAPA MAKES A SWARMING-POLE.

I wrote to you once before. My father takes a long stick, and then some hemlock boughs, and fastens them upon the stick, and then takes some mullein-stalks, puts them in with the hemlock, and it looks like bees, and the swarm goes there.
New Milford, Pa., Apr. 23, 1884. ROSE SMITH.

ALICE'S SECOND LETTER.

I write to let you know how our bees are doing. They all got through the winter but four hives, and they died. We have 18 hives left. I help my ma milk. We have two little calves and one little chicken. I help my sister Katie wash the dishes. This is my second letter. ALICE GOUGH, age 10.
Rock Spring, Mo., April 17, 1884.

HARVEY'S REPORT.

My pa keeps 55 hives of bees, and makes piles of honey.

HARREY S. LINCOLN.

Rupert, Bennington Co., Vt., March 9, 1884.

KATIE'S CHICKENS.

Ma set a hen with 14 eggs, and they were hatched December 25, and I raised them in the kitchen; but I did not do as well as the old hen would have done. I lost four of them; but the rest are doing very well.

KATIE BARNWELL.

Orbisonia, Huntington Co., Pa., March 17, 1884.

A FACT FOR BEE-HUNTERS.

In bee-hunting in Australia, the natives attach the light down of a owl or other bird to the back of a bee, and are thus enabled to trace the bee in its flight to its home.

ROSEY SMITH.

New Hamburg, Ont., Can., March 7, 1884.

It seems to me your letter is rather short, Rosey, is it not? You used to write good long letters.

HOW VANCE HELPED WHEN THE BEES SWARMED.

I live in Irving. It is between Indianapolis and St. Louis. There is a man here who has 150 stands of bees. His name is Dr. Hobson. I worked for him about 5 days in swarming-time. Sometimes there were 5 or 6 swarms a day. My father is a wagon-maker.

VANCE RARER.

Irving, Mont. Co., Ills., March 10, 1884.

HARRY'S REPORT OF THE BEE BUSINESS.

I worked for a man last summer who has about 150 stands of bees. They averaged about 8 swarms a day. I got stung several times, and do not like it very well. My father is a shoemaker.

HARRY YEMARS.

Irving, Montgomery Co., Ills., March 10, 1884.

Friend Harry, there are worse things in the world than bee-stings. See if you don't agree with me when you get a little older.

CHARLEY'S BEE-HIVE, AND THE HONEY HE GOT FROM IT.

We have 6 swarms now; last fall we had 7; one died in winter. Father gave me a swarm last spring. It swarmed once, and gave about 50 lbs. of comb honey, which we sold at 25 cts. per lb. Out of the 3 hives we sold about \$35.00 worth of honey.

CHARLEY H. HOBERT.

Rome, Marathon Co., Wis., April 27, 1884.

ROSALIE AND HER FOUR SWARMS OF BEES.

Pa has 15 swarms of bees, and I have 4. They are all young swarms but one. We did not get much honey last season. Last summer my brother and I hived two swarms of bees when pa was away. I help pa take care of the bees, and I like them; but ma says she hates bees. Pa has got one of your A B C books, and I read some of it.

ROSALIE WARFLE, age 14.

Tracy Creek, Broome Co., N. Y., March 15, 1884.

A LETTER FROM THE ORANGE-GROVES.

Papa has bees, and I help him attend to them, and have been doing so for the last three years. One time one stung me on my eyelid, and by night it was so swollen that I could hardly see out of it, and another one stung me on my nose. Papa has an orange-grove, and it is in bloom now. I send you in this some of the blooms. Then are very sweet, and are white.

JACOB P. MENDEL.

La Grange, Brevard Co., Fla., March 10, 1884.

PERRY'S DESCRIPTION OF THE BABY HERBERT.

I am a little boy 7 years old. My pa has got 28 stands of bees. We got lots of honey last summer. I go to school. I have three brothers and one sister. The youngest is a baby, 8 weeks old. His name is Herbert. He has got blue eyes and black hair. He weighs 15 lbs.

PERRY WHITING.

New Lebanon, Mont. Co., O., April 24, 1884.

CARRYING BEE-HIVES ON HORSEBACK.

My father has 100 swarms of bees. They are doing nicely. We expect swarms next month. We are having lots of rain this year. We have had about 26 inches so far, so there will be plenty of flowers for bees this year. My father moved his bees over the mountain on horseback, when we moved to this valley.

ERNEST HILTON, age 10.

Los Alamos, Cal., April, 1884.

QUINCY'S EXPERIENCE.

I am a little boy. I have four colonies of bees. We have 33 in all. One colony swarmed out. They had no honey. I hived them, and they got confused, and tried to kill the queen. I took her from them in one of pa's hives that was queenless and very weak. She would not go to laying. Then we put a frame of sealed brood in the hive. She is now laying finely. My colony has raised a queen. My bees are all blacks but one.

QUINCY FORGERY.

Blooming Grove, Tex., March 30, 1884.

FROM 18 TO 27; 100 LBS. OF HONEY, AND 3 BARRELSFUL BESIDES.

Our 18 colonies of bees came through in good condition last spring; we increased to 27, and took 3 barrels of extracted honey, and nearly 100 lbs. of comb honey; pretty much all made from white clover and basswood; but after basswood-bloom, the bees made scarcely any honey at all, so we had to feed them some before we put them away last fall.

DORA STOUT, age 10.

Richland Center, Richland Co., Wis., March 3, 1884.

ROBERT TALKS TO US ABOUT THEORY AND PRACTICE.

About as good a method of beginning bee-keeping as can be adopted, under existing circumstances, is for the tyro to obtain a manual of apiculture and a hive of bees. He must largely be self-taught. The theory can be got from a manual, but the practical part must be obtained by actually handling a hive of bees during the working season, when the various operations of breeding, storing, comb-building, and swarming, are going on.

ROBERT WOOD, age 13.

Horning's Mills, Ont., Canada, Apr. 28, 1884.

ROBBING BUMBLE-BEES' NESTS.

I am a regular hand to kill bumble-bees, but never had much to do with honey-bees. I killed 9 nests of bumble-bees last summer, and never got stung a dozen times. I have a dog; his name is Bob. He can catch a rabbit sometimes before it can run ten feet. My dog and I have caught a lot of rabbits this year. I have a little garden, and I raise popcorn, onions, and watermelons.

CHAS. G. ATKINS.

Kirksville, Monroe Co., Ind., March 7, 1884.

Friend Charlie, when bumble-bees' nests are annoying they may have to be destroyed; but I hope you will remember that it would be wrong to tease and kill the poor insects through wanton cruelty, or, if you choose, just to have fun with them. Bumble-bees are God's creatures, just as well as the cats

and dogs that I have talked to you about on another page.

FROM 3 TO 17.

My pa has 17 swarms of bees; last spring he started with 3.

PAFFROW MORES.

Dupont, Hennepin Co., Minn., April 7, 1884.

MINNIE'S REPORT.

My papa had 19 swarms last fall; he has only 16 now. He lost three. His lightest swarm is all right yet. It was very light, so he plugged up the entrance so only one bee could get out at a time, and now it is quite strong. I am going to take care of the bees next summer.

MINNIE BURK, age 14.

Crystal, Mich., March 12, 1884.

ETTIE'S REPORT.

Father has one swarm of bees, and my brother-in-law has 25, and he packs them on the ground with sawdust, making a nice dry shed over them. He sold about \$100 worth of bees last fall, and about 500 pounds of section comb honey at 25 cts. per pound.

ETTIE LATHAM, age 13.

Hilliard, O., March 10, 1884.

ELLA'S LETTER JUST AS SHE WROTE IT.

WEI I ME Root i SaW the other Iittl giRlS Was Ritng to yoU and i right to you to. i Like to helP Pa eXtract honEy. i WoID Like to help Pa With the Bees. But When they sting Me on the face it sWeIl mY eyes shut. WeI MR Root if this it woRth a letter Pleas send me the siIver key.

ELLA KIRK, age 6.

Columbus, CheRokee Goutny, Kans.

WHAT CONSTITUTES THE BEST PAPA IN THE WORLD?

Well, Mr. Root, pa had 27 stands of bees, and sold one. We got 1200 lbs. of honey last year. I like to help pa with his bees. When they sting me it does not swell. Pa is not going to increase in number, but he is going to build them up strong. He thinks that is the best way. Our bees are all alive so far. I saw that one little girl said she had the best pa in the world because he did not drink nor smoke nor play cards. My pa is still better than that. He does not do any of them, nor chew tobacco, nor swear, and I think he is the the best pa in the world.

Columbus, Kan. HATTIE KIRK, age 11.

HOW PARTHINA'S FATHER TAKES DOWN SWARMS.

My father had 25 stands of bees the first of May, and has now increased to 40. He did not have boxes enough. Most of the time he put two swarms into one box, and they did well. Pa got the bees in the orchard. I watched them in swarming-time. If they settle down on a low limb, pa puts a box under the tree, and shakes them down in front of the box; and if they are too high up, he sets a ladder up against the tree, and cuts the limb off, and carries it down. Sometimes he takes a pole and puts a bucket on it, and holds it under the swarm, and gives the bucket a shove against the limb, and they all fall in, and then pa takes the bucket down and empties it in front of the box.

PARTHINA REICH, age 12.

Cooperstown, Ill., March 6, 1884.

HOW WILLIE AND HIS FATHER MADE THE PICKET FENCE.

I weigh 115 lbs. Who can beat that? This is a nice day, and we are making garden. Pa and myself have been making pickets this spring. We hauled

the logs to the mill and got them sawed into boards $\frac{3}{4}$ thick, and then we took our thrashing-engine and sawed the lumber 3 feet long on our wood-saw, and then we took the rip-saw and ripped them up 2 inches wide, and I ran the engine. Don't you think I did pretty well for a boy 11 years old?

My uncle John keeps bees, and he told me that by writing a letter to you you would send me a book.

WILLIE E. GRATE, age 11.

Yale, Portage Co., Ohio, May 1, 1884.

A SOLUTION OF THE PROBLEM ABOUT THE HONEY-CANS.

The solution of the problem by Harry Labarge, in JUVENILE GLEANINGS of February 15th last, I find to be as follows: Pour the 3-gallon jar full, then empty the same into the 5-gallon jar; fill the 3-gallon jar again out of the 8-gallon jar; then fill the 5-gallon jar out of the 3-gallon jar; pour the 5-gallon jar into the 8-gallon; empty the 1 gallon left in the 3-gallon jar into the 5-gallon jar; then fill the 3-gallon jar again out of the 8-gallon jar, and empty the 3 gallons again into the 5-gallon jar, which will leave 4 gallons in each of the 5 and 8 gallon jars. We have very cold weather here, and also good sleighing. Our bees are in the cellar, and are in a good condition.

THEODORE G. KYBER.

Green Bay, Brown Co., Wis., March 10, 1884.

Quite a number of answers have come in solution to the above problem; but the above answer will suffice, I think.

LETTER FROM A LITTLE CANADIAN GIRL.

My brother has 85 colonies of bees. Part of them are Italians, and part are blacks. They gathered lots of honey last year. He sent some of it to Montreal, and sold some at home. I like to watch the bees in the summer; and when they swarm, I run and tell papa or brother Frank. I should like to call you Uncle Amos as some of the boys and girls do; may I? I wish I could see little baby Huber. Are his eyes blue or black? My eyes are black, but I have a little brother 4 years old who has blue eyes. Does little Huber walk yet? I should like to give him a good kiss. Mamma told me about where your girl cut paper dollies. Tell her I should like to be there and help her. I go to school every day. I hope this letter is not too long. My sister Alice helped me spell some of the big words. Do you like to have so many little boys and girls write to you?

BERTHA J. JONES.

Bedford, Quebec, Canada, March 8, 1884.

By all means, call me "Uncle Amos." Bertha. I should like to have all the little boys and girls in the world feel as well acquainted with me as if I were their uncle in very truth. You will find a lot about Huber on another page.

MATTE'S STORY AND ITS MORAL.

My pa keeps bees. He has 15 colonies. Two years ago he had only one, which he purchased for \$3.00. They swarmed 5 times the first summer. We put them in the cellar; but when we took them out in the spring there was one weak swarm, and the rest pitched into them and robbed them of about 25 lbs. of honey.

MATTE W. MOSHER.

Delavan, Wis., April 7, 1884.

Do you want to know what the moral is. Matte? It is this: Be careful about leaving a weak force of bees to stand guard over a hive full of honey. A great many big

troubles have come about just by carelessness in this one thing.

CASPER'S REPORT.

My brother had ten hives of bees, six of them black and four of them Italians. I don't think he got much honey from them. This winter he lost three hives of them, so he has but seven. My father had a misfortune. On March 10 he had a saw-mill and a tub-shop burn down for him. I have a twin sister named Carrie. CASPER J. PETERS, age 11.

Very good, Casper. I suppose you are the boy your sister tells about below. Going to have a hundred, are you? Well, I hope you will; and I hope they will be, every one of them, *tall* ones too.

I now sit down to tell you that I am one of your little bee-girls. I like honey on my bread, also on my pancakes. My brother has ten swarms of bees; intends to increase to a hundred.

CARRIE A. PETERS, age 11.

Bleecker, N. Y., March 17, 1884.

THE ANTS, THE FLOWERS, AND THE BEES.

The ants got in our bees, and we had a bad time getting them out. We have some peas, onions, potatoes, lettuce, peppers, and corn. I have a plum-tree, and this morning the bees were all over it. When we looked in the hives this morning they had a lot of honey. I have a flower out here that is just like a pitcher, and is yellow. Every morning it is full of water. EDDIE O'RELL.

Vernon, Jennings Co., Ind., April 26, 1884.

Eddie, if that yellow flower is full of water mornings, when there has been no rain, I am inclined to think you will find the water is sweet water; and may be if you have enough of them you will find the bees carrying in this sweet water to make it into honey. Just take another look, and see if I am not right.

SAYING A QUEENLESS COLONY BY TAKING A QUEEN FROM A VERY WEAK ONE.

I help my brother-in-law. Last summer he had only two swarms. He bought 5 more last fall. I helped him last fall to pack them. He wintered them out on their summer stands. None were queenless last fall. Five came through strong, and two came through weak. That one had about a handful left. He took the queen and put it into the queenless swarm the 17th of March; he looked the other day, and she had a nice lot of brood, so I guess they won't kill her. He is a beginner, and likes the bee business. MARY E. SPARKS.

MARY E. SPARKS.

Grattan, Kent Co., Mich., April 16, 1884.

Friend Mary, we can often save a colony in the manner you state; but I should say, where you have such a weak one as that, with a queen, take the bees, queen and all, and give them to the stronger one—that has no queen.

RECIPE FOR GINGERBREAD; FROM A 10-YEAR-OLD.

After reading Mary Rhodes' recipe for ginger-snaps, I thought I would tell her how I make gingerbread. One cup honey, two eggs, half cup butter, one large spoonful ginger, one cup sour milk, one teaspoonful soda, flour to make either soft or hard. I have made it both ways, and papa said it was very good. I have also made several batches of bread which papa pronounced excellent. I was ten years old last month; have never been to school, but I study at home. We all love to hear about Huber

Peter. Please tell us more of his funny doings. We had a good laugh over his way of giving you back your door-key.

Papa has forty colonies of bees, all in good condition. I will report to you this fall, if you wish me to. LYDIA R. SMITH.

Ferndale, W. T., April 9, 1884.

A GOOD PLACE TO KEEP COMB HONEY.

Father puts the honey over the kitchen stove, and in June it is just as nice as ever. It is recommended by the neighbors as the best ever tasted. He never tried extracted honey, but comb will keep there. Mother had a swarm of bees die, and can not find out what ailed them, as they had capped brood and honey, and were packed snugly in a chaff hive. We looked the A B C book over, and did not find any thing that explained their case.

GENEIEVE HILL, age 9.

Randolph, N. Y., April 13, 1884.

Friend Geneieve, Dr. C. C. Miller recommended keeping comb honey just the way your pa does. I think if you will turn to the back part of the A B C book, near the picture of "Blasted Hopes," you will find some suggestions as to why your bees died.

EDITH GIVES US ANOTHER REMEDY FOR BEE-STINGS.

Pa said he would give me a swarm as soon as I got old enough to take care of them. He keeps his bees in the cellar in the winter. I read little Ah Sid's experience with "Melican buttel-fly" this morning, and I thought it was pretty cute. My pa uses hot water when he gets stung; he thinks it is better than any thing else. EDITH BASCOM.

Albion, Calhoun Co., Mich., March 23, 1884.

Your remedy may be a very good one. Edith: for although I thought I had tried almost every thing, I think I never tried *hot* water. If you are stung on the hand, putting it in water as hot as you can bear it might stop the pain, for it will often give almost instant relief for a bruise or a sprain, or something of that sort. If you should get stung on your nose, or near your eyes, I do not know how you could work your hot-water cure. By the way, children, I have known a hot-water bath to make one feel good-natured when cross. Did you ever hear of such a thing?

ABOUT THE BEES AND CHICKENS.

Bees are flying when days are warm. We have two stands. One swarm came off July 5, 1883; got no surplus from it, but we got 361 lb. sections filled from our old one. Some are black, and some have one and two yellow stripes. I have your A B C book. Bees are in Nellis hives. We should like to buy an Italian colony, if we could get one cheap. Last spring we got a sitting of the American See-brights, from Columbus, O., at \$3.00 per sitting. They are good layers. We have five hens and one rooster, and get as many as five eggs a day. We sell them for \$1.60. J. H. MONTAG, age 11.

Saxenburgh, Pa., April 22, 1884.

Friend J., you do not make it very plain about the amount of honey from the old stand. Was it 36 one-pound sections, or 361 pound sections? Learn to be careful in making your figures, as they may mislead one. We have had some big troubles, I tell you, about figures, or because words and figures were crowded too close together.

THE BEES AND THE FISH-POND, AND THE GERMAN CARP.

Uncle keeps bees; he does not take GLEANINGS, but his friend Mr. Stone does, so we get it in that way. Uncle has got 75 swarms of bees; he also has a fish-pond with German carp in it. They are quite large now. The pond is very pretty, but uncle was nearly a whole year making it. I received the Story of the Bible, and thought it was very nice. I am sure Huber will make a good man.

Cheviot, Ham. Co., Ohio. FLORA HILDRETH.

Thank you, Flora, for your description, and also for your kind words.

ANOTHER COLT THAT HAD A RIDE IN THE WAGON.

My papa has a colt that we gave a ride in a wagon. We were going to Lompoc, and the colty got tired, and papa was going to try to lift it into the wagon himself; but a man came along, and papa asked him to help, and they put him in the wagon. California wagons have high seats, and the colty could just stand under it, with his head over the dashboard. His mamma would not go on without her baby; and as she was trying to find him, she happened to look up, and saw him looking down at her. She gave a joyful whinny, and trotted on lively, looking back at him once in a while to see if her "Dicky" was all right. It made folks laugh when we got to town. The next day we carried him home the same way. Our horses like sour milk; and when papa is milking the cows, the colts bother him if he lets them in the yard, for milk. My brother has a little dog that gets so jealous if another dog is kept, that he won't eat nor look at us till mamma boxes the other dog's ears; then he makes friends with it and us.

LEWY HILTON, age 3½.

A JUVENILE HAPPY.

I have just received my watch as a present for 10 new subscribers for GLEANINGS, and I feel like writing a little to you, to give expression. I thank you for your kindness and liberal offer. I think the juveniles should never forget you, but ever persevere in doing all the good they can for you and others, and thereby gain knowledge themselves. My watch is now hanging up over the fire-board, running nicely, and keeping time with pa's clock.

ABOUT BEES IN NORTH GEORGIA.

Pa's bees are doing very well at this time, but have been checked up by the frost. He has had no swarms yet, but have several that have entered the honey-chambers. I gave mine a honey-chamber today. I shall look anxiously for them to move up there. My hive has a young Italian queen, and her bees are large and industrious.

Mr. Root, if you know any reason for so many queens dying, please let us know. Pa has lost one-fifth of his queens since brood-raising time.

Rome, Ga., Apr. 18, 1884.

NETTIE BRYAN.

Friend Nettie, it is hard to tell why so many queens fail in the spring, unless it is they are subject to something of the same malady as the worker-bees, which has so often been called spring dwindling. Where the bees get this disease, many of the queens are found missing, and sometimes we find them out in front of the hive.

TWO SWARMS FROM THE SAME HIVE GOING IN TOGETHER.

I live near Lake Ontario. My papa has 9 colonies of bees. He keeps them in chaff this winter. Last

summer a swarm came out; we hived them, and about two hours after, we hived the second swarm. Very soon the second swarm came out and went in with the first. Was this any thing unusual?

IS RYE-FLOUR FEEDING ADVISABLE?

Is it of any account to feed rye flour to the bees at this season of the year?

EDITH A. HERSEY, age 9.

Red Creek, N. Y., Apr. 8, 1884.

It is not unusual for two swarms to go out as you state, and go together, when they are both *after*-swarms. Where several queens hatch in a hive at once, they often go out in separate bodies, and sometimes one goes a little before the other. The humming of the first swarm would be very apt to attract the others, and thus induce them to go along with them.—I think rye-flour feeding beneficial, if done judiciously; and I should say, let the bees have it whenever they will take it, unless there should be circumstances that might induce them to go out in unseasonable weather. Some seasons it has seemed detrimental; but on the whole, I think it profitable to give it to them whenever they go around picking up sawdust and other like substances, indicating they are in want of pollen.

WHERE DO THE BEES GO TO?

We have not had any swarms this year, but are looking for them every day. One of our neighbors has had 3 swarms. We have had a terrible overflow down in this part of the country, and it did some of our bees right bad. We have got some swarms of bees (if it be called a swarm) that have good queens and plenty of honey, and only about 50 bees at the largest. Can you tell me what the cause of it is? Papa thinks that they got drowned. We went down the Mississippi River a few days ago in a skiff; and coming back through the lake we saw a great many bees on the water; some were dead and some were not. We saved a few by lifting them up out of the water on our oars, and put them in the boat until they got dry, then they flew away. Do you suppose that it is something that they get off the flowers that is poison, and it kills them before they get home? or what do you think is the cause of their falling into the water? You will confer us a great favor by giving us your ideas about it, through GLEANINGS; and yet we have some as good swarms as anybody.

THOMAS C. KINCADE.

Sterling, Chicot Co., Ark., April 8, 1884.

Friend K., I believe it is generally thought not quite so well to keep bees near large bodies of water; for if they get down into the water they will seldom get out again; but I am inclined to think in your case it was more what is called spring dwindling than the flood. When the bees have this spring dwindling they go out of the hive when the weather is too cold, and are then soon scattered around on fences, the sidewalks, and on the ground. Some of them get back to the hives, and a good many do not. If near bodies of water, and they should get chilled, and drop into the water, of course that would be the last of them. What you need is steady warm weather without high winds. Heavy winds during chilly weather are very destructive to bees in the spring. Cutting off the forest-trees has something to do with this spring dwindling.

SHORT AND SWEET.

My pa has bought some bees, but has not got them home yet. Please send me a book.

TOMMIE BRACKIN, age 12.

Town Creek, Lawrence Co., Ala., May 4, 1884.

Very good, friend Tommie. I suppose you could not very well write much of a bee-letter till your pa got the bees home. The facts you give us are no doubt new and true, even if they are not as yet very valuable.

WHAT THE DOCTOR DID FOR A DANGEROUS BEE-STING.

In answer to friend W. W. Edwards' letter about dangerous stings, I thought I would tell you about a neighbor of ours who got stung in the throat by a honey-bee, and in a few minutes he could not speak, but was in great pain, his throat swelling nearly shut. They ran for the doctor, and he boiled catnip in a coffee-pot and let him inhale the steam, and in a few minutes he was well enough. We have 20 colonies of bees in good order. We get all our bee-fixtures from you. Pa gets GLEANINGS; he says he can not do without it. I am a little girl, Uncle Amos; I am 19 years old. IDA BENNETT.

Black Lick, Ind. Co., Pa., May 5, 1884.

HOW PA GOT HIS FIRST START OF BEES.

In the summer of 1879 pa bought two stands of bees in the old-fashioned box hives from an uncle of mine. They got their start of bees when the country was first being settled up, when bees were plentiful in the woods. In January, pa went over to uncle's to get his bees, and I would say it was just about cold enough to freeze rabbits' tails off. Pa put two blankets around his two stands of bees and put them in an old spring wagon, and started for home, and I had to go with him to get them. We had about six miles to go before we reached home; but we finally got home at last, but were so cold pa could hardly walk; but he managed to get to the fire.

Well, he and I warmed well before we brought the bees to the yard. Pa said he was warm, and we would go and get the bees and loente them. So we went and got the two stands, he one and I one. He was leading the way to his present apiary; we had to go through the house, for he wanted his apiary to be on the north side of the house. He wanted me to open the doors of the house for him. On the north side of the house the ground was covered with ice; and when pa stepped down on the ice, I am sorry to say he fell about ten feet, and his stand of bees went about ten feet further. Pa rolled over about twice, and got up and looked at me, and went stamping along, chewing his tobacco. I really felt sorry for him. R. L. CLOYES, age 14.

Miles, Ky., March 6, 1884.

Well, friend R., you have told your story pretty well, and I suppose we are to infer that your pa has built up a fine apiary from these two stands, and that the swarm of bees were not seriously hurt, even if they were considerably astonished by the mishap. Does your pa still chew tobacco? If he does, there are some more smokers all ready to be sent out to tobacco-chewers, and a little book to go with them.

HOW TO MAKE WOODEN SEPARATORS.

I live at my grandpa's. He has forty-seven hives of bees; he has taken them all but 15 out of the cellar; they have all wintered well. He says that I may

tell you how he makes wooden separators, and perhaps you will send me a book. He saws them from pine lumber with his Barnes saw, about 1-12 inch thick, and 1½ wide, and nails four of them on a wide L frame, and they do not trouble by warping.. GRACE DOROTHY.

Blakesburgh, La., April 3, 1884.

It is a fact, Grace, that separators sawed out will keep their places very much better than the shaved ones. I should think it would be rather slow work, however, to saw them out by foot power. If I understand you, your grandpa makes each separator in two pieces. If they are nicely matched this will do no harm; but if they are not matched in the joint, it would make a seam in comb-honey.

WINTERING NUCLEI, AND FLAX TOW FOR WINTER PACKING.

My father has about 130 colonies of bees. We had last winter 50 nuclei in the cellar. We have lost but two nuclei. Last summer we got from 60 colonies, 6000 lbs. of honey. My father uses flax tow for packing bees in winter. He says, it being linen it beats any other material he has ever tried for packing bees. He goes around where our neighbors raise great fields of flax, and brings home a wagon-load of tow, and spreads it out in a big ring, and tramps the shives all out with the horse, and then it is all ready for packing bees with.

ANNA QUINBY, age 12.

Edenton, Clermont Co., O., April 23, 1884.

Friend Anna, it has been generally thought pretty difficult to winter nuclei; but if your father carried through 50, with the loss of only two, he did exceedingly well. No doubt tow packing will answer an excellent purpose where it can be procured readily.

WHY DID THE BEES GO OFF?

Pa's paper and A B C book came all right. He is pleased with his book. He reads it every spare minute he's got. Last spring, 1883, he got an Italian swarm. He bought one black swarm; in the fall he had 6 and 173 lbs. of honey, one-half comb. This black swarm came out in ten days, and alighted on the fence. He put them back, and put an Italian queen with them. He had her caged up for a couple of days. He then let her loose, and the same day they went off to the woods, after they had comb honey and brood sealed over. Pa would like to know why they went off. He left his bees on summer stands, and packed them in chaff. I went to the woods to get leaves to put in little cushions for the bees for pa, and this spring they came out all right, and now they are gathering honey and lots of pollen. Cherry and plum bloom will soon be out, and we expect to get lots of honey. I like to help pa with the bees, but I go to school all the time. Pa is making lots of hives for his bees; he expects to be a bee-man. He keeps them on the south side of a cedar hedge. WALTER STONER, age 13.

Fernhill, Middlesex Co., Ont., Can., May 2, 1884.

Friend Walter, it is a little difficult to say why bees sometimes desert and go off when they have honey and brood, and every thing they want. Your closing idea of a cedar hedge, is, I think, a pretty good one. We have just been drawing manure to put around our Norway spruces, in order to make them hurry up and form a good solid wind-break,

ALICE'S REPORT.

I have two bee-hives. I had one swarm to-day, and that made me two. We have 13. Mamma has 8, and grandma has 5. The bees feed here first on the water-elm, which opens in Feb. After the water-elm come the redbud, the common willow, and the plum. Our bees have been at work ever since Feb., when the weather was so they could get out. Papa is afraid of the bees. Sometimes they make him step around pretty briskly. We have now in bloom some beautiful roses. We have the Simplicity hive. Grandma has had two swarms this year.

ALICE ROBERTS, age 13.
Brandon, Hill Co., Texas, April 26, 1884.

A COUPLE OF LETTERS FROM WALTER AND CLARA.

We have a honey-extractor, and I help turn it; and when we take up honey, I carry in the frames. My papa used to take rotten elm to smoke the bees, but he once set a hive on fire by the sparks. We had two swarms last fall, but two died this winter.

WALTER A. SMITH, age 9.

I stayed home from school to-day, and mamma said I might write you a letter. We have 60 swarms of bees, some Italians and some blacks. Papa likes the black bees best. We have a wax-extractor, and Mr. Hunt works up our beeswax into foundation. We have sold 860 lbs. of honey, and we have 250 lbs. left, and we eat honey every day. We have a large hive that contains four swarms. We smoke the bees with cotton rags soaked in saltpeter. We have a baby that is two months old. We call him Elmer. Is my letter good? Did you say yes? Please send me Ten Nights in a Bar-Room.

CLARA L. SMITH, age 8.
Greenfield, Mich., March 10, 1884.

I guess I did say yes, friend Clara, for we sent the books some time ago, and here is your letter in print.

ANNA TELLS US HOW HER PA CIRCUMVENTED THE MICE.

We keep our bees on an east hill-side, near the creek. They are sheltered from the storm and wind by timber on the west side of them. We don't use an extractor. We get all our honey in one-pound sections. Pa thinks from 40 to 60 lbs. per colony is a very good yield for this part of the country. The mice got into four of our hives; and if pa had not seen where they got in they would have destroyed them before we knew it; but he opened up the hives the first warm day, and drove them out and killed one of the mice, and stopped up all the hives with strips of tin, nailed across the entrance so close to the bottom-board that a mouse could not get through.

ANNA B. MCGREW.
Milnersville, O., March 7, 1884.

GRACE'S STORY.

It was in the fall when we were banking the house. I stood looking out of the window, and I saw a little ball of fur on my brother's shawl. He brought it in. I took it in my hand, wondering what it could be. Carley (that's my brother's name) told me to put it under a fly-screen, in the warmth of the stove. As I stood watching it I saw it unroll its tail; pretty soon it put out one little foot, then another, and another, until four little soft silky paws came in sight. Then out came a little red nose, and there were two little black eyes looking around in wonder, thinking spring had come too soon. He had little gray ears standing upright, and

in all it made a pretty little mouse—a deer-mouse, my mother told me. Then he began to be lively, playing his little tricks, trying to get out from under the screen. We fed him some bread crumbs, thinking he might be hungry. After we had played with him long enough, Carley put him out in the cold again, and he rolled himself up again, winding his tail around him like winding yarn around a ball. After a while we placed him in cotton batting and put him in a hollow tree. After two or three weeks we dug into the tree to see what had become of our strange pet. There had been a few warm days, and he had crawled out, thinking spring had surely come this time. I regret to say we have lost him entirely.

GRACE B. WIRES.

Southville, March 9, 1884.

WILL BEES WORK IN DAYLIGHT?

I am reading the children's letters. I see that Andrew Holzer, page 125, has made a mistake where he says that bees will not work in the light. Now, this is a grand mistake, for we had an observatory-hive sitting in our windows for about three months last summer, with glass on either side, and they worked as well as any bees. We could see the queen in the act of laying, and could see the young bees crawling out of the cells. I would advise all who think that bees will not work in the light, to make an observatory-hive.

J. A. SHENEMAN, age 11.

Pharisburg, Union Co., O.

Do not be in too great haste to censure, friend S. Although bees can be taught to work in the light, they often show a strong disposition to wax up apertures, and even to cover sheets of glass so as to exclude the light; so we have good reasons to think they prefer darkness to light; but I guess it is not because their deeds are evil, as it is with the human family. I am glad to know you succeeded so well with your observatory-hive.

ABOUT THE BABY OCTAVIA, ETC.

We have got Octavia's (our baby's) pictures taken. I wish you would put your baby's picture in the children's department of GLEANINGS. My papa received his goods from you yesterday. He is unpacking them to-day. This is not a good season for bees; it is too rainy and cold. Papa has 40 hives of bees. I help him all I can. I am 8 years old; brother Dale is 5, and little Octavia is 2. Mamma says I have not spelled some of the words right; but I will try to learn to spell better before I write again. Mamma told me some of the big words.

M. EDITH KEENEY.

Queerc Grove, Switz. Co., Ind., April 28, 1884.

So, Edith, your baby's name is Octavia, is it? I should be glad to have Huber's picture; but you see, there isn't anybody in the world smart enough to make a baby's picture just as nice as the baby is himself. Did you ever see a picture as nice as your baby? I am glad your mamma is taking such pains to have you learn to spell.

GEORGIA AND THE SKIPS OF BEES.

Pa has 17 skips of bees. I see they like to sip the honey from the sunflowers and other plants. I have one brother, and he has 10 skips of bees; he has just begun to keep bees. He is going to give me a skip of bees.

GEORGIA MAY WILLIAMSON.

Covert, Seneca Co., N. Y., March 17, 1884.

How funny it is, Georgia, that people have

such different names for things! Where we live we say a hive of bees; and in some places they say a gum, because bees are often kept in a hollow log sawed off from a tree; and as gum-trees were often hollow, and not very apt to split, they got to calling them gums. Your people call them skips, and in some places they call them skeps. Many of our Southern friends call a hive full of bees a "bee." Who can tell us any more names for a hive of bees?

OMAR'S LETTER.

I have one swarm of bees. They are in a long hive that holds 18 frames. I can put another story on my hive, and 18 more frames. Sometimes we extract the honey, and sometimes we put in sections for comb honey. The old queen lays eggs in the sections, and spoils them. The bees made lots of clover and linn honey last year. The ground was white with clover. They did not get much fall honey. We have ten swarms. One swarm ate up all their honey. Aunty put some of the poor starved bees down on the board in front of another hive. The other bees came out and fed them, then they let them go in the hive. Wasn't it funny, Mr. Root? Aunty has to feed four stands. She puts molasses in the frames, made of white sugar. My book says the queen has twelve bees to wait on her; is it so?

The maple-blossoms have been out some time. The bees have been gathering honey from them, when it was warm enough. It has not been very warm yet. The willows are blossomed.

I have four new hives. Uncle Virgil got them of you last summer. OMAR CLOVER,
Pierceton, Md.

Friend Omar, I guess the papers don't understand bees quite as well as you and I do, or they wouldn't say the queen has *twelve* bees to wait on her. The queen has a sort of body-guard, or retinue, it is true; but even that is often exaggerated, for it may be two or three bees, or it may be a dozen or more, and I don't suppose the same bees follow her around at all, for they are constantly changing about, and those that feed and caress her one minute will probably be off doing something else the next.

SEVERAL SUGGESTIONS FROM A JUVENILE.

I will tell you what I did with the watch I got of you. I gave it for 3 stands of bees in old box hives. My father put them in L. hives, and they swarmed once apiece. I anticipate getting a large crop of honey. Father had 3 swarms of bees—one the 18th and 2 this morning. He is quite busy now with his bees. They are all in good condition.

ANOTHER HIVING-BOX.

Father has a frame he holds up when they are swarming. It holds just an L. frame. He puts the frame of comb in and holds up, and all alight on it, then he shakes them in front of the hive, and they all run in. The way my father moves bees from one locality to another, he puts an empty frame between every one that is full, then puts in a wedge, and they are firm as you please, and there are no bees smashed.

ANOTHER PLAN OF INTRODUCING QUEENS ALSO.

My father is quite jubilant over his success in introducing queens. He dips the queen in fine flour, and lets her loose; she runs in, and they clean her off, and she is acknowledged their sovereign; that is the way he introduces all his queens—never loses

any in that way. My father has nearly 100 stands of bees, all in Langstroth hives. He intends to send to you for some honey-pails after a while. I have a little brother and sister. It would do you good to see them eat honey. SALADO SIMANTON.

Brookston, Lamar Co., Tex., Apr. 28, 1884.

The idea of having a frame of brood in the swarming-box has been several times suggested, friend S. It seems to me as if it were unnecessary trouble, and not really essential. I never knew bees refuse to go into the swarming-box if it is held up against the cluster, nor have I ever heard of their leaving it after they once go in.—Your father's plan of introducing queens is certainly a very novel one; but is he really sure that the flour has any effect either way? It may be that bees would not sting a queen as soon if she is covered with flour, although I am inclined to doubt it a little. Was not his success owing to the fact that queens will, a great part of the time, be well received without any caging, daubing with honey, or any thing of the kind?

BERTHA'S KIND LETTER.

We began the spring of 1883 with 13 colonies, and increased them to 34. We lost two of them in wintering. We got about 35 lbs. of honey per colony, spring count. We disposed of it at 12½ cts. per lb.; we sold several stands at a good price. We had 23 queens laying in Feb. How can we extract honey now? Our bees have some surplus honey, which we want to take out. We have not much clover here. The bees get most of their honey from lucerne and wild flowers. The snow is quite deep here yet. We have a small yellow flower here; it blooms as soon as the snow is off. It furnishes the bees with pollen about 6 weeks. We have had goods from you several times; they were O. K., especially the extractor. It is the best one I have seen, and everybody says it is a wonder. We all think your smoker is excellent. Your A B C has taught us more about bees than any man or any other book we have seen. I do not know how we could get along without GLEANINGS.

IS SWELLING OF THE HANDS OR FACE CAUSED BY SIMPLY WORKING AMONG BEES?

Father has looked at the bees twice this spring, and his face swelled up both times, and the bees did not sting him. Was it the smoke of the cotton rags that made it? Can you give us any light on the subject? BERTHA LARSON.

Fairview, Utah, March 17, 1884.

Friend Bertha, you have struck upon a matter that has puzzled a good many as well as yourself. It has been suggested, that one may be so sensitive to the poison of the bee-sting that he will feel the effects of it from the air. I know bees often put out their stings with a drop of poison on it. Well, it is supposed that this poison is volatile, and passes off in the air, enough to produce the effect you have mentioned. I have sometimes thought I could feel it in my eyes; and the fact you give affords another link in the chain of evidence. Perhaps it was this that caused the swelling; but for all that, I should apprehend no bad consequences to follow. The poison of the bee-sting is rapidly coming into use as a valuable agent in medicine.

OUR HOMES.

Owe no man any thing, but to love one another; for he that loveth another hath fulfilled the law.—ROM. 13: 8.

I HAVE often wanted to talk on this subject of being in debt, or getting in debt, if you choose; but, dear friends, I have been a little afraid to undertake it. Do you know why I am afraid? Well, I am afraid I should not be able to so prepare myself that I should be entirely free from prejudice, that I could speak in an unbiased way. I am interested, as it were, and perhaps on that account I could not handle the subject in a way that would do the good it might if it came from a minister, or some one who is not in active business as I am. May be the feeling has been a wrong one, and that I am am just the one to speak, because I have had such great and varied experience in this matter of debt and credit. I have prayed that God might purify my heart, and free me from uncharitableness or pride, or any thing else that might stand in the way of making this Home paper a helpful one; and as I start out, I breathe again that little prayer now: "Lord, help thy servant, that he may, especially in this talk to-day, shadow forth thine image, and in his own feeble way thy great love to all humanity, and may he have thy love toward all his fellow-men."

There are some who people think it wrong to get into debt. I remember a good old gentleman who gave me some very excellent advice once. He had got to be quite a rich man, and yet had so persistently paid cash down for every thing, that he rarely if ever went to sleep at night with the feeling that he owed any man a copper. At one time when the grocer could not make change, he said he took a pound of tea without paying for it. The thought so troubled him during the night, he went on foot several miles the next morning just to discharge the debt, and then his conscience was at ease again. There was something a little inconsistent with this good old friend, however, for he made a business of loaning money to other people. In fact, I went to see him with my father, to borrow some money to start in business. He advised me to go back home and start in business as best I could, without borrowing money. I did so, and I thank him to-day for his advice just at that crisis. I soon got in debt, however, for all that; but it was a debt for goods, and not for borrowed money. As time passed on I found I could buy to better advantage by having ready cash. Since then I have been paying interest on borrowed money almost all my life, and I think it is in many respects a good thing to do. Many times I have taken money that people were very anxious to let out. Very many times I borrowed money from widows who had families to support, and I think I did them a kindness by paying them interest promptly. I suppose you all agree to what I have been saying. If so, where is the evil, if evil there is, in getting in debt?

Many of our sins and weaknesses are of a class where there are extremes both ways.

One may talk about his neighbors too much, and one may talk about them not enough; one may be too suspicious of his fellow-men, and he may go to the other extreme and be too confiding on short acquaintance. Is it not so about getting in debt? If so, where is the dividing line? where do the greatest number of people err—in being too much afraid of owing somebody fifty cents over night, like the friend of whom I have told you, or do they err in borrowing, or getting in debt when it would have been much better to have gone without the thing they had not the money to pay for? We err oftenest in buying that which we do not need. Is it not so, friends? Especially do young people err in this direction. If you offer a boy or a girl credit without stint, a bad use will almost always be made of it; and, indeed, you may do them a great harm by lending them money they are very anxious to borrow, or by giving way to their importunities to let them have something on credit. Most of us can look back and remember how greatly hurt we were when somebody refused to trust us in that way; but for all that, it is likely the person who refused did us a great kindness.

In our recent Sunday-school lesson, Paul tells us how a Christian should behave himself. He says he suffers long, and is kind; envies not; is not puffed up; does not behave badly; is not easily provoked; bears all things; believes all things; hopes all things; and endures all things. We admire those beautiful verses, and all the world bows down in assent to their truthfulness as well as beauty. How ought a Christian to do in regard to this matter of debt and credit? Our opening text says you should owe no man any thing but love one to another, and a Christian should surely have love to those he does business with, no matter how they behave. When he is lending or borrowing, the great animating object of his love should be to do good. If by borrowing he can do good, borrow; if by lending he can do good, lend; but he should always beware of doing any thing that may do harm, even though he be importuned never so much, and even though he would rather give the money over and over rather than be obliged to refuse.

I have, during my business experience, known many times what it was to need money badly; I have racked my brain, and scraped up my available effects; I have sold property at a sacrifice, and I have many times prayed that God would help me to secure the amount I needed to pay something I was owing, so I know what it is to be in a strait for money. I have also refused to let some of my valued friends have money, or I have refused to help get it for them when I thought I had good reasons for thinking it would do them harm instead of good. During the past few years I have tried to do all this, and yet avoid having anybody say or even think I was a poor specimen of a Christian because I performed these difficult tasks in a poor way. How shall we as Christians manage with wisdom this essential element in business? I will tell you, friends, a rule I have been slowly forming for my rule of conduct in these matters, especially in this

trying matter of borrowing money, or of buying things to be paid for at some future time, which amounts to the same thing. My little rule has been this: To tell those whom I was owing that *I would get it for them whenever they told me they wanted it*; and to carry this out, of course I must use such care and economy, and such foresight as well, that there would never be a chance, or that there could not *well* be a chance, of my getting where I should fail in doing this.

A few days ago an old friend came into our factory and looked through it admiringly. He is a man who has been a minister of the gospel the most of his life. After looking around for some time he made the following remark:

"Mr. Root, this is all beautiful as well as wonderful; but it gives one a feeling of sadness as well as pleasure."

"Why so?" I asked in a little surprise.

"Because," replied he, "such large establishments are sure to fail and become bankrupt, sooner or later."

I confess, the speech cut me a little at first; but for all that, I guess it did me good. I replied,—

"My friend, do you really mean that a man who is an earnest Christian fails in business and becomes bankrupt?"

"Why, it seems they do sometimes, sooner or later."

"But, if you will excuse me, is it not because they depart from their Christianity and lose their religion?"

He was, perhaps, a little surprised at my earnestness, and replied with a smile, "May be so," and left me.

I have thought of this very often since, friends. Why did I feel hurt or indignant at the remark he made? And if good Christian men have really drifted out of the way, and got into trouble by having large property on their hands, why should I expect to be an exception? I know I am on delicate grounds here, friends, and I know I am laying myself open to charges that have been made a great many times; but all my old tried friends will understand me, and make allowance for what weakness they may see in what I have been saying. The question still rings in my ears, "Has a Christian any right to fail in business?" It just now occurs to me that I replied to the friend of whom I have been speaking, something to this effect:

"A man can never fail in business, and never become bankrupt, so long as he is always prepared to pay all he owes in the world to anybody, whenever they ask for it, or on very short notice."

And this brings me back to my little rule of action in regard to the matter of debt and credit. It has been this: To be prepared at all times to hand over all I was owing to anybody whenever it is asked for, or when they seemed to want it badly; or, to put it in another way, I determined that the world should know that they could always have what money or any thing else I was owing them whenever they wanted it. You may urge, that there are times when circumstances make it very difficult or absolutely impossible to do this. My reply is, that you should take into consideration circumstances

before you get in debt; that you should determine beforehand to go without things rather than incur risks; and when you have tried repeatedly to borrow money, and your friends do not seem to want to lend you willingly, take it for granted that God thinks it best that you should not have it—or, if you choose to put it in another way, decide in your own mind it is best for you not to have it, and go without it, no matter what the circumstances may be. To follow out the little rule I have given you, of course you will need to have resources at hand of some kind. These resources should be planned so as to meet any contingency. Perhaps I should define my position here by saying, that when you borrow money for a certain length of time you do not owe it until that time has expired; and if the one to whom you owe it should want it before that time, if he can persuade you to pay it sooner, well and good; but, of course, he has no right to demand it sooner than the time agreed upon.

An old lawyer once made the remark when a circle of people were severely criticising an absent brother, "Everybody ought to do all he *agrees* to do; and when he has done this, he is a pretty good man, and you have no right to find fault with him or abuse him."

I have often thought of this, and it is a pretty good rule, I believe. We all have rights. We have the privilege in this free country of ours of doing what we please with our own property, or with what we have honestly earned; but every one who professes to be a Christian, or even a gentleman, should try very hard to keep all his promises good. What is to be done, then, when one *can't* keep his promises? Why, get a release, of course. One can ordinarily get a release from a promise by presenting a good reason why he should be released. But, of course, he should make application for release at the very earliest moment possible. I once heard another lawyer friend of mine make the remark, that to get an honorable release from a promise is virtually *keeping* a promise.

Now, in this matter of debt and credit it were well to keep the above points in mind. Suppose you owe money, and it is demanded of you, and you can not pay it; what is to be done? I am afraid we are in too much of a hurry to use this word *can't*. Before telling anybody that I could not pay money I honestly owed, I would make some pretty great sacrifice. I would sell property at half its value; in fact, I have done this already, thinking it better to lose my property than to lose my good name. A great many times, after having told the one I owed what I was going to do in order to pay him, he has often relented, and told me not to do so badly as that. Of course, if you can get such a release as that, all right; for the whole point at issue, friends, is to conduct yourself in such a way that you shall not dishonor the name of Christ, whom you profess to follow, and that you shall not dishonor your own name by doing such things, or have any one feel that you are not as good as your word, and are not to be relied upon. I tell you, friends, this is a very great thing in this world, to earn a reputation of being good in spirit as well as letter. What I mean is,

good in business circles; *good* for all you promise, or *good* for all you undertake.

A good many years ago a young man came into my store with his mother, and wanted to buy a watch. I did not know him, but I knew his father and mother to be good Christian people. The watch was never paid for. In fact, he turned out badly, and failed to pay a great many of his good friends. His relatives all expressed sorrow for the course he had taken, and there the matter dropped. Quite a number of years afterward I heard this man was converted; I heard, also, that he had become an active, working Christian; and finally I met him at a Sabbath-school convention. He was to deliver an address, or take some part in the proceedings, as I was also. I thought I had a good deal of grace, and perhaps an unusual degree of charity for trying occasions; but yet, dear friends, that man's profession of Christianity, while he did not pay his debts, or say a word to anybody he was owing in regard to them, was almost more than I could stand. It threw a chill and damper over me; and although I knew it was wrong, I had one of the hardest battles to fight I have ever had to try to remember that it was my duty to keep my heart right before God, no matter what this man did. I have met him frequently, and talked pleasantly with him; but some way I can not make it harmonize. You may say I should have gone to him and talked the matter over with him. I presume I should; and I have decided I had better do so; and yet I am afraid I shall not be able to discuss the matter in a Christian-like spirit. That old little prayer wells up while I think of it—"Lord, help."

I have not told this little incident because I wanted to talk about anybody, or find fault; in fact, I hope the friend of whom I have been speaking will not see this, because I do not want to hurt his feelings uselessly; but it brings up so vividly this point in the Christian lives of all of us that I have chosen it. Do not, I pray you, feel hard toward those who profess to love the Lord, and yet can not pay their debts, or who think they *can not* pay, if you choose; but let us rather look into our own hearts and see if there is any thing in our lives in this matter of debt and credit that may stumble any one. Let us resolve that the foremost thing of our lives *shall* be to seek first the kingdom of God and his righteousness; and if it shall so happen that one of the readiest ways of bringing men into the kingdom is to see that we "owe no man any thing but love one to another," let us set about doing it with all our might and main.

A new convert should be a great power in the community in which he lives, in bringing souls to Christ, and he should be able to feel that he can approach every acquaintance on this subject. But, dear friends, how *can* he do this with the consciousness in his heart that there are those whom he does not dare to meet, and whom he does not dare look in the face? Did you ever realize how it cripples one's power of doing good by being obliged to hang down his head when he passes certain individuals—or, if he does not hang down his head, to feel in his heart that

he ought to do so? The spirit of Christ bids men to be open, fearless, and frank; and nothing so effectually quenches this spirit, or chills or drives it away, as these things of which I have been speaking.

But, what shall a new convert do, you may ask, if he finds himself in this predicament? Suppose he has been wild, and "sowed wild oats," as the expression goes—has deliberately incurred debt here and there until it is almost hopeless for him to think of paying it all. He has confessed his sins to his Savior; has renounced the old life, and started in the new; what shall he do about these debts? There is an old saying, that "there is nouse crying over spilled milk;" but I do not quite believe that saying; I do believe it does us good to cry hard over spilled milk, or over things that seem almost as hopeless of recovery as milk poured out on the ground. Whenever I meet a case of this kind, or talk with one who has started for a better life, how often I feel like saying, "Why, oh why, my dear friend, did you push ahead in this foolhardy way, buying things you did not want, or that you could have got along without, very well? Why did you, with your eyes wide open, make this task so hopeless of getting back on to solid ground, where every honest man should stand?"

Now, then, as it is *already* done, what shall he do about it? The first thing to do is to go to every one he owes, no matter how many there be, or how large the amount; put it down in a book, or put it into notes, and take full account of both principal and interest. Do not ask them to "throw off" some, but treat the whole matter as if you were sound and straight, and able to pay all; get it all right before you, in correct business shape; then with the burden in black and white right before your eyes, make it a subject of prayer that God may help you; and as fast as you can, pay each one a little. A blessing seems to follow paying a little of your indebtedness, even though the amount be small; and a blessing seems to follow in undergoing privations, and in denying yourselves when it is done for the sake of those you owe, or for Christ's sake, if you please.

People often excuse themselves for not paying debts, by saying they have done the best they could; and when a man has done the best he can, he can not do any more. I have got to feel, somehow, that this plea we are often led to make, "I am doing the very best I can," is of itself an indication of a wrong state of heart. In one sense we are *never* doing the best we can. When our souls are enlightened by the influence of the Holy Spirit, and we sit down and calmly contemplate these past lives of ours, it seems an awful falsehood to say we have done the best we could. We have wasted time when we might have been earning money; we have discussed and argued when we might have been saving souls; we have foolishly wasted money for things we could have easily gone without; we have dishonored our Savior when we might have been saving our fellow-men. Where one has really done great things, compared with average lives, in Christ's kingdom, he has never any disposi-

tion to say he has done the best he could, but, rather,—

So likewise ye, when ye shall have done all those things which are commanded you, say, We are unprofitable servants: we have done that which was our duty to do.—LUKE 17: 10.

Satan is sure to get hold of a man who allows debt to run and accumulate. Just notice how quickly the man who owes begins to talk hard about the one he is owing, and accuses him of underhanded and mean ways of doing. You have probably heard the expression, "If he had used me like a man I would have paid him every cent of it as soon as I could; but now after the way he has acted, I won't pay him till I get ready." And this, too, to one who has done him a kindness and a favor!

A great many plead sickness as a reason for not keeping promises or paying bills that ought to be paid. Please do not think me uncharitable here, dear friends; but it has often seemed to me that a man's family is more apt to get sick when he does not pay his bills. In fact, he is more apt to have trouble of all kinds. It is the man who is as good as his word year in and year out who seems to be blest in all he undertakes. Many people, Christian people even, seem to think they are not under obligations to pay borrowed money as if it were something else that was borrowed, or that a bill they owe the grocer or the butcher is different from a tool or vehicle they borrowed, or any other piece of property. Let us take a little illustration:

Your neighbor has a nice new wheelbarrow which he has bought because he needed one and wanted it almost every day. You come to him some time and say, "Mr. A., we have got a big lot of wood to get from the street into the woodhouse, and it would save us very much hard back-breaking fatigue if you could just manage to spare the wheelbarrow a little. We will be very careful of it, and not injure or break it." Suppose your neighbor, because he wishes to be accommodating, puts himself out a little to let you have it. When you took it you honestly intended to do exactly as you agreed. But suppose it should transpire that that wheelbarrow was not only kept many days, but weeks, months, and years, and that a neighborhood quarrel came up almost every time Mr. A. spoke of wanting to have it again. Suppose you talked about him in your own family, and abused him, and that, too, while you are keeping the wheelbarrow, and using it every day. Suppose, too, that when he suggested that, if you really could not spare it, to let it be sent back home again, you should pay a moderate rent for it, and you should indignantly decline to pay a copper in the way of rent, but still hold on to the wheelbarrow. You say the case is preposterous. No one ever heard of a neighbor so unreasonable and mean. Perhaps not. But suppose we substitute, in place of the wheelbarrow, ten dollars' worth of meat or ten dollars' worth of groceries. When you bought the meat or groceries, you asked to be accommodated until Saturday night. Saturday night came, and you could not pay it. The longer you put it off, the more inconvenient it seemed to be to pay it: and finally, because you are

owing this little bill, you trade at some other grocery or butcher shop, where they do not trust at all. Is the case so very much better than with the wheelbarrow? Your neighbor finally asks if you can not pay interest. You tell him you think if he gets the principal he ought to be satisfied, and yet you have had the use of the money all these years; in fact, he could not keep you from having the use of it, because you said you could not get around to pay it.

Sometimes discussions come up as to what interest should be paid. The butcher or the baker has borrowed money at the bank to go on with business, and has been obliged to pay eight per cent. May he has paid this interest, or more, during all the years your account has been running; but yet if he should think you ought to pay him the same interest he has paid on the money he had borrowed, you would call him hard names; and yet very likely *his* family has been sick too, as well as yours.

I believe it is usually considered that every man has the privilege of charging what he thinks proper for what he has to sell. If he charges too much, people won't trade with him, and he is the loser. If we do not like what people ask for things, we don't buy of them. If we do buy of them, ought we not to pay their prices? If it is really out of our power to pay money we owe, ought we not, out of courtesy to the kind friend who has furnished it for us, be willing to accede to anything he may ask, and thank him even then? Have we any more right to take any one's money and keep it when he wants it than we have to take his wheelbarrow and keep it when he wants it? The wheelbarrow could be sent back under almost any circumstances one can imagine; that is, you could carry your wood, or whatever else you had to move, instead of wheeling it, after some fashion or other, and you could not get along without the money. Well, friends, I admit there are circumstances under which one can not get along without money. There is sickness in your family, and you must have the doctor's services. A man who wouldn't go for the doctor because he had not the money to pay him, would be almost guilty of murder; therefore you must go in debt. It is right to go in debt; but granting this, have you any right to say that it is the doctor's business to furnish the medicine and advice without pay, because you hadn't the money and couldn't get it?

Perhaps what I am going to say now seems hard; but after the troubles I have seen, and among Christian people too, in regard to this matter of debt and credit, it seems to me we need a pretty vigorous stirring-up, if any thing can stir us up. If it is not the doctor's business to lose, who should lose it? My friend, if you are doing the best you can, and *can not* support yourself and family, you have no right to ask the doctor to support you, nor the grocer, nor the butcher. The plain, obvious thing to do, as it seems to me, is to divide it around among your townspeople; in other words, state your circumstances plainly, and let the expense be borne equally, instead of thrown all upon one person. Many difficulties come up in business,

and we shift the responsibility off from our shoulders and let it pass. Some little time ago, you may remember, I told you that a man wanted a smoker because he saw his neighbor using one; and finally he handed the neighbor 75 cents to send to me. The money never reached us, and on being told the circumstances I sent the smoker, asking the one who ordered it to explain matters, and get his friend to send me half price if he could. The friend said he had paid for the smoker once; that he did not agree to take any chances of loss by mail, and that he would not pay for it again. The man who sent for the smoker said he took the money handed to him, and sent it to me as an accommodation. He made no profit whatever in the transaction, and therefore he should not stand any of the loss. This reasoning is very fair and reasonable on both sides; but for all that, I had furnished the smoker and had not received a cent by way of equivalent. People often refuse to pay debts on just such reasoning, and yet the one who furnished the goods is out of pocket; and out of pocket, too, as it often happens, as a reward for having an accommodating spirit, and being sorry for the mishaps of his neighbors.

I presume the greater part of you who have taken the trouble to read this paper today are followers of the Savior; you love the Bible and its teachings; you are trying to seek first the kingdom of God and his righteousness; you recognize that "the earth is the Lord's and the fullness thereof," and that we are but stewards, and have our possessions only in trust. I know how prone we are to forget that it is only trust, and that we have no right to get an idea that anything belongs to us in any sense — that we can do as we please with it, whether God approves or not. Keeping this in view, how careful ought we to be to do nothing that might stumble any one whom we would lead to Christ! In our prayer-meetings and Sabbath-schools we profess to be deeply anxious to see all mankind come in, friends and enemies alike—especially the enemies—for our Master has particularly commanded us to love them and pray for them. To further God's work we are desirous of living "at peace with all men, so far as in us lieth." Friends, how can we live at peace with all men when we have — shall we say borrowed their wheelbarrows and kept them for our own use, refusing to pay rent or return the borrowed property? I have often thought it was a kind of disease that people fall into, for we find professors of religion, and members of churches, who do these things, and do not seem to be very much troubled about it either. No doubt they would be troubled if they kept a wheelbarrow so long; but they keep money until they have almost forgotten they owed it, and perhaps finally declare outright they do not owe it, and never did. Of course, a great part of these troubles come up by leaving things at loose ends; time passes, and they are "kind o' forgotten about." The one who lent, suffers, as a matter of course, more than the one who made him suffer; and when the matter is brought up, there is disagreement and uncharitable feelings. My friend, is there any

thing you can do in your neighborhood in this line? Are you in any way to blame, even a little, for the cause of Christ being hindered in your own community? Would it not be well to read over our little text, and consider it again in all its bearings?

Owe no man any thing, but love one to another.

TOBACCO COLUMN.

HEADED THIS TIME BY A JUVENILE ONLY 10 YEARS OF AGE.

MR. ROOT:—I am a little orphan boy ten years old. Ma and pa are dead. My brothers and sisters are in Arkansas. I live with uncle Bailey. He takes GLEANINGS. I was taught to chew tobacco when, but a babe. I have quit, and will not take another chew. Will you please send me a smoker? Uncle Bailey keeps bees. He says if you send the smoker he will give me a stand. Then I will take GLEANINGS.

Brinkley, Tenn.

JASPER GRIFFIN.

I am very glad, Jasper, that you have decided to stop where you are. The effect of tobacco on a boy of your age would probably send a blight through your whole life. If you give it up now, and take care of yourself, you may perhaps outgrow the ill effects it may have had. We gladly send you a smoker, to remind you of your promise whenever you see it.

On the first of January I quit the use of tobacco, having used it 38 years. I claim the smoker free.

Knob Noster, Mo., March 6, 1884. J. WAMPLE.

I have quit smoking tobacco, and please send me a Clark's smoker; and if I resume, I will pay you for it. I have a good section for my bees. I have not lost any yet.

JAMES C. SPEARS. □

Rogersville, Ten., Feb. 5, 1884.

I read GLEANINGS with pleasure, and in it I read a good many letters about folks using tobacco. Some have quit it, some quit awhile, and then commence it again. I have used it myself, in smoking and chewing; but by the grace and help of God I quit the use of it about 8 or 10 years ago, and believe that that grace is sufficient to keep me from using it any more, and keep me from all other vice, if I continue in trusting in him, and ask him faithfully to help me.

MOSES BRECHBIEL.

Newburg, Tenn., Feb. 14, 1884.

BREAKING THE CHAINS OF BONDAGE.

For three years I have been a reader of GLEANINGS. In that time I have been highly amused at the varied experiences in the Tobacco Column. Very likely my experience would be quite so to others. Some 35 years ago it was my misfortune to learn, among other vices, the use of tobacco—habits that even now bring the blush of shame to my cheek. Over fifteen years ago I was enabled, through God, to quit that which would intoxicate, and make a man a fool; but, like many others, I reserved the right to smoke and chew. Oh what a blunder we commit in this! what blessings we deprive ourselves of! Well, sir, I have given tobacco the shake, and I am determined to be a slave no longer. May God help many more to break the fetters that bind them, that they may be free also!

WM. BATTLE.

Blairsville, Indiana Co., Pa.

GLEANINGS IN BEE CULTURE.

Published Semi-Monthly.

A. I. ROOT,
EDITOR AND PUBLISHER,
MEDINA, O.

TERMS: \$1.00 PER YEAR, POSTPAID.

For Clubbing Rates, See First Page of Reading Matter.

MEDINA, MAY 15, 1884.

Who shall ascend into the hill of the Lord? or who shall stand in his holy place? He that hath clean hands, and a pure heart; who hath not lifted up his soul into vanity, nor sworn deceitfully.—PSALM 24: 3, 4.

We will pay 10c each for the January GLEANINGS (not JUVENILE) for 1883.

THIS number is printed entirely from new type. I thought perhaps I had better tell you, as you might not have noticed it otherwise.

E. S. MILLER & SON, Dryden, Mich., wish us to give notice that they can fill no more orders at present, as their stock and factory have been burned by fire. We trust they are insured, that they may be ready for business soon.

DRONE COMB FOR BEE-FEEDERS.

FRIEND J. E. Stanley, Wyoming, N. Y., makes a feeder of a piece of drone comb fitted in the bottom of a shallow box. The hole is made through in the center of the piece of comb, and through the box also, and the bees are to come up through this hole. Drone comb is better than worker, inasmuch as the syrup goes down into the cells much easier. I have often used a drone comb for feeding, by simply pouring the syrup into the cells on both sides, and then hanging up in the hive. The objection is, that the queen will often fill it with eggs after the bees take the feed out.

DIPPING-BOARDS OF PINE.

FRIEND JONES gave us a great many new kinks while here, and one was the above. Now, we used pine for dipping-boards a good many years ago, and thought we had discovered that some harder wood was a great deal better. The reason was, we did not make our pine boards thick enough, and we did not have them entirely free from knots. These we have now are full $\frac{3}{8}$ thick, and without a trace of a knot or blemish in them; and if kept soaked with water, we find they make the most perfect sheets of anything we have ever tried. Please try it, you who are making foundation.

SEED OF THE SPIDER PLANT.

We are out of the spider-plant seeds, and do not know where to get any, and yet a good many of the friends want some. If you have any, and will send it to us by mail, we will pay you at the rate of \$2.00 a pound for it. Would it not be a good idea for the boys and girls to set to work and save some this season? The seed is easily gathered, but it needs to be done every day, or every two or three days. Just grab hold of the pods when they look ripe, and if they shell out they are all right. If they do not, wait until you come around next time. Where there is a good patch, a little girl will gather a pail full in three or four hours (provided the pail is not large).

GRASS AND WEEDS AROUND THE ENTRANCES.

If you are annoyed in this manner, sprinkle a handful of salt around where you do not want the grass and weeds, and they will very quickly die, and stay dead. Half a bushel of salt will go over a pretty good-sized apiary; and even if they need another dose after a while, we begin to think it is about the cheapest way to keep their little dooryards clean. Do not have the little fellows spend more time dodging around obstructions than it takes to suck the honey out of the apple-blossoms.

HYBRID QUEENS WANTED.

A MONTH ago I told you why untested queens are more desirable than tested, and gave that as a reason why orders were probably so many for untested queens. Within the last few weeks we have been surprised to find that there is a wonderful call for hybrid queens. We had decided not to purchase these this season; but a friend has just sent for 40 hybrid queens with half a pound of bees with each, and we have had many other orders. To tell the truth, I do not much blame the friends, for we get almost if not quite as much honey from hybrids as from full-blood Italians. Until further notice we will pay 90 cts. for untested queens, and half as much for hybrids.

REVISED PRICES OF NOTE, LETTER, AND STATEMENT HEADS.

THERE has been so much of a call for GLEANINGS paper, as mentioned in a recent editorial, that we shall be obliged to make a new schedule of prices. The size generally preferred is $5\frac{1}{2}$ by 9 inches. There are 300 of these in a pound. We furnish the paper plain for 20 cts. per lb., as we have told you; 10 lbs. for \$1.80; 100 lbs. for \$15.00. You will notice, that even by the single pound you get 15 sheets of paper for a penny. Now, we rule this paper by means of the printing-press, as I have told you; and while we are printing the ruling on it we can just as well print the heading or business card. But we can not very well set up the type for any particular job for less than about 50 cts. After the type is once up, we will furnish you 100 sheets of paper for 50 cts., or 500 for \$1.00. Thus you see you get the last 400 as cheap as you get the first 100. Now, if you will take 10 lbs. of paper, which will be 3000 sheets, we will furnish it already printed for \$2.50. This latter, you see, will give you 12 printed sheets for a penny. Who is there among us who can not afford to have his name and address, INCLUDING COUNTY, printed on his writing-paper?

PUTTING TWO OR MORE ADDRESSES ON YOUR LETTERS.

ONE of the greatest troubles in business, as we have so often told you, is to find out where folks live, and where they want their goods sent to. Many times orders are sent us from some other town or postoffice than where the party who makes the order lives. In that case they head the letter where they are at the time of writing. Another address is given at the bottom of the letter, and no one is sure which of the two is right. Now, friends, why not, when writing, use only one address? It is not uncommon to have three, and the difficulty may not be discovered until the goods are packed and ready for shipment, and just where shall they go? Delays are oftentimes dangerous; and when we take the risk of guessing as the only alternative, the writer writes back and suggests some fact that did not occur to our over-worked

clerks, and perhaps we have to stand the loss. Now, why not cut short all this confusion by being careful to mention only the place where you wish your things sent, and no other? If your postoffice and express office are different, of course it can not be helped; but please do be careful to mention it distinctly. Why not have it printed right on your stationery?

DELAYS ON ORDERS.

OUR business at present is perhaps larger than ever known before in the month of May, or, for that matter, in any other month. Orders by mail, however, go off promptly the day they are received, almost without exception. The same can be said of express; and in regard to freight, we have a great supply of every thing that I now think of, unless it is sections. On these there is necessarily some delay. Several have complained pretty severely because we are unable to tell what the delay will be. The trouble is, our packing-room is constantly one great whirl and uproar; and to keep our small army of packers busy, one order is often dropped and another taken up, on account of circumstances and conditions hard to explain here; and the order we at one time thought would have to wait a week, may, by a combination of circumstances, be put on the train within an hour; and sometimes, I am sorry to say, *vice versa*. Come and take a look at us, and you can understand it better. If you object to such a way of doing, you can have your money back by first mail any time you say so. I am very, very sorry indeed, friends, that we are not even yet able to take every order just as soon as it is received, during these busy honey months. But as our business still increases faster than our facilities, at certain seasons of the year, it happens as I have told you. Queens and bees go almost by return mail or express, although we have been hindered on some large orders by too small a supply of untested queens. Our apiary is now pretty close on to 300 full strong colonies, from which to draw bees and brood for filling orders.

SECTION BOXES.

As usual at this season of the year, there is a great clamor for honey-boxes, and they all want them right right off. Our basswood is now in pretty nice order, and we are turning out a good many thousand daily, for our machinery is now in operation from four in the morning till seven at night. We would run it all night too were it not for the extra insurance incurred. Now, while doing our utmost during this fearful rush to accommodate all as fast as possible, a great many, I feel sure, are borrowing trouble before there is any need of it. This is indicated by the number of letters we get at this season, asking when to put on the honey-boxes. A few days ago a man drove a good many miles for some sections; said he must have them at once. When asked to explain, he said his hives were so full of bees they were all clustering out, and he wanted to put on the sections so they would have room to stay inside. This was before fruit-trees of any kind were in bloom. Now, friends, there are very few of you who will have any use for sections before white clover is in bloom, and it will be a damage to your bees to have the boxes on several weeks before they will have any honey to put into them. When the combs are all filled below, and clover honey is coming in at such a rate that the brood-nest is being crowded, then the sections should go on, but not till then.

REMINDERY.

Honey from apple-blossoms is very rarely obtained in such quantities that the brood-nest won't hold it; and rather than put in the sections I would extract a comb or two, or, better still, take out some full combs and replace them with empty ones; for during the interval between fruit-blossoms and white clover they will almost always need these combs back again. If any thing should happen that your bees do not get abundance of stores during fruit-bloom, you will have to feed before clover comes. This feeding at this point is of the utmost importance. A good many colonies will manage to starve through this interval, even though they do not die outright, but it cripples and hurts them greatly. Oftentimes at this season we see a little honey at night, but not a drop to be found anywhere in the morning. This is a bad state of affairs, and I would by all means supply the deficiency by feeding. Sugar syrup, or maple sugar laid on the top of the frames, or a poor grade of honey, will keep them going nicely; and if followed up judiciously may cause swarms to come out, even before the white-clover honey comes. New swarms especially need to be fed during this interval, for they often come out during fruit-bloom and suffer greatly, even if they do not starve outright, unless they are watched and fed just at the proper time.

CONVENTION NOTICES.

NOTICE TO BEE-KEEPERS.

Under a resolution adopted at the last meeting, an extra session of the North-Eastern Kentucky Bee-Keepers' Association is called to meet in the city of Covington, Ky., on Saturday, May 17, 1884, at 9 o'clock A.M., for the purpose of transacting such business as may come before it. It is hoped there will be a full attendance of the bee-keepers of North-Eastern Kentucky. Membership fee, 50 cts.

A. D. O. ROBERTSON,
Chairman Executive Committee.

The Mahoning Valley Bee-Keepers' Association will meet at Newton Falls, O., on June 6, 1884. Mr. Hammon and Mr. Page will read some very interesting essays on the summer management of an apiary.

E. W. TURNER, Sec.

Contents of this Number.

Table listing contents of the magazine with page numbers. Includes items like 'Apple-bloom', 'Banner Apiary', 'Bee-keepers', 'Hats for Bee-keepers', 'Heads of Grain', etc.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen is reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind, that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with *, use an imported queen-mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. 1st. If wanted sooner, or later, see rates in price list.

- List of names and addresses of beekeepers offering queens. Includes: A. I. Root, Medina, Ohio; H. H. Brown, Light Street, Columbia Co., Pa.; Paul L. Viallon, Bayou Goula, La.; S. F. BEE-KEEPERS' SUPPLIES.

It will pay to get our prices before purchasing supplies; good Langstroth hives, with 8-in. cap frames, in the flat, 60 cts. each; Langstroth winter-protector, in lots of 50, \$1.50 each; small lots, \$1.75, all in the flat. Manufactured of good pine lumber. Workmanship unexcelled. Crates, Sections, and Foundation. WM. O. BURK, 8-1fd Successor to Hiram Roop. Crystal, Mont. Co., Mich.

Nuclei! Nuclei!

Bright Italians, gentle and beautiful. Will send any number of frames desired in nucleus. Try my half-colonies. Better than a new swarm. Terms reasonable. Send for circular, and don't forget it.

Dr. A. P. COULTER, 5-12d Lock Box 231, Marissa, St. Clair Co., Ill.

HOLY-LAND AND ITALIAN QUEENS

By return mail, tested, \$2.50 each; untested, single queen, \$1.00; six, \$5.50; twelve, \$10. Cook's Manual of the Apiary, cloth, with order for queens, 90 cts. Safe arrival guaranteed.

I. R. GOOD, 11-ftfd. Sparta, White Co., Tenn.

Hive Manufacturers.

Who agree to make such hives, and at the prices named, as those described on our circular.

- List of names and addresses of hive manufacturers. Includes: A. I. Root, Medina, Ohio; P. L. Viallon, Bayou Goula, Iberville Par., La.; M. S. West, Flint, Genesee Co., Mich.; Apiarian Supply Co., Wilton Junction, Mus. Co., Ia.; C. P. Bish, Petrolia, Butler Co., Pa.

VANDERVORT COMB FOUNDATION MILLS.

Send for samples and reduced price list. 2-ftfd JNO. VANDERVORT, Laceyville, Pa.

IF YOU WANT,

I will send you 2 lbs. of bees or more in one package, for \$1.00 per lb. Hybrid queens, 50 cts.; untested, \$1.00, all this month; after, 50 cts. per lb. Tested queens after 15th of June, \$1.50.

M. L. WILLIAMS, 11-d. VANCEBURG, LEWIS CO., KY.

EARLY BEES.

BEES OF ALL KINDS AT PRICES TO SUIT PURCHASERS. AT ALL SEASONS OF THE YEAR.

After July 1st, almost given away. A. W. CHENEY, KANAWHA FALLS, W. VA. 5-ftd

HONEY COLUMN.

CITY MARKETS.

DETROIT.—Honey.—The honey market is still lifeless; good honey is quoted at 16¢@18¢, but is not wanted. *Beeswax.*—30¢@35 cts. A. B. WEED, May 26, 1884.

BOSTON.—Honey.—The sale of honey is almost over, and we are obliged to sell 2-lb. comb for 15c.; and 2½ and 2¼ lb. comb from 10 to 12c. No 1-lb. in market. *Extracted,* 7¢@10c. BLAKE & RIPLEY, May 24, 1884. 57 Chatham St., Boston.

CLEVELAND.—Honey.—There is a continued steady demand for 1-lb. sections of best quality at 18c.; 2-lb. not so active at 17c.; 2½ qualities are dull at any price. *Extracted* not wanted. *Beeswax,* 35c. May 23, 1884. A. C. KENDEL, 115 Ontario St., Cleveland, O.

St. LOUIS.—Honey.—We quote to-day as follows: *Extracted* in barrels, 70¢@71½¢; in small cans, 9¢@10c. There is very little demand for comb honey. Same in good order would bring 15c; white-clover, 18c. *Beeswax.*—Stock small, and in good demand. Sells at 33¢@35c. W. T. ANDERSON & Co., May 26, 1884. 104 N. Third St., St. Louis, Mo.

NEW YORK.—Honey.—The demand is falling off extensively for both comb and *extracted*, and we believe the season is about to close. We make no changes in our quotations. *Beeswax* is very scarce, and sells at from 37 to 38c. THURBER, WHYLAND & Co., May 24, 1884. West Broadway, Reade & Hudson Sts.

NEW YORK.—Honey.—Honey is still moving off rapidly for this time of the year, but at the following low prices. We quote fancy white in 2-lb. sections, glassed, 13¢@14¢; fair to good, 11¢@13¢; dark grades, 10¢@12c. No one-pound sections in this market. *Extracted* honey in kegs and small bbis., 8¢@9c. *Beeswax,* scarce, 36¢@38c.

MCCAUL & HILDRETH, 80 Hudson St., Between Worth and Leonard Sts., N. Y.

KANSAS CITY.—Honey.—No perceptible abatement of the demand for choice white comb in 1 and 2 lb. sections at 15¢@16c., but dark and irregular comb, or even choice comb in any but clean, neat, and uniform packages, goes begging at 10¢@12c. *Extracted,* quiet and in good supply. Nominal at 7¢@8½¢. *Beeswax.*—Small lot sold to-day at 35 cts. None to speak of in the market. JEROME TWICHELL, May 22, 1884. Honey Depot 514 Walnut St., K. C.

MILWAUKEE.—Honey.—The demand for honey is very fair for this season of the year, and now quote: 1-lb. sections, choice, 15¢@16c. Ruling price, 15c.; 2-lb. sections, choice, 14¢@15c. Inferior to fair, 12½¢@13c. *Extracted* in cans, white, 8½¢@9c. *Extracted* in cans or pails, dark, 8¢@8½¢.

Beeswax wanted at 28¢@30c. Will you please call attention to my card inclosed, which shows you that I have removed to a new place of business, and I think facilities for selling honey and productions generally are increased? May 16, 1884. A. V. BISHOP, 142 West Water St., Milwaukee, Wis.

CHICAGO.—Honey.—The supply of comb honey is very light, and there does not appear to be any choice comb to come forward. Choice white comb in 1-lb. sections brings 18c. Anything short of choice is worth 12¢@15c. *Extracted Honey.*—There is quite a large amount here, and demand is very light. Purchasers refuse to pay over 7 cts. for manufacturing purposes. Sugar is used instead of honey at present prices, a good article of cane sugar being purchasable at 6 cts. per lb.

Beeswax in demand at 37 cts. for prime yellow; 30¢@33 cts. for off color, etc. R. A. BURNETT, May 23, 1884. No. 161 South Water St., Chicago.

REVERSIBLE-FRAME HIVES,
—AND—
WHITE BASSWOOD SECTIONS.
SEND FOR CIRCULAR AND PRICES.
5-7-9d O. J. HETHERINGTON, East Saginaw, Mich.

NOTES FROM THE BRIGHT-BAND APIARY.

I CAN now command 500 colonies in the queen business, if necessary. My intention is to produce queens not excelled by any. Price, untested, but laying in May, \$1.00 each; 90 cents each the rest of the summer. Tested queens, any time, \$1.50. The above are from my improved bees, same queens bred from Kingsley's improved bees, same price. Kingsley's improved bee is simply a cross between the Cyprian, Italian, and Holy-Land bees; and in reality they are ahead of any race, both for color and honey-gathering propensities. Sample live workers sent for 3 cents to pay postage.

All orders promptly attended to; safe arrival guaranteed; full directions sent with each queen. Make money orders payable at Shreveport. Address CHAS. KINGSLEY, Benton, Bossier Par., La. 107fd

A BARGAIN IN SECTIONS!

Our stock of 6 to L. frame one-piece sections, made with the square-cut groove, we will sell at the low price of \$4.00 per thousand. As good sections can not be bought at any other factory for less than \$5.00 per thousand.

11-ftfd. BERLIN FRUIT-BOX CO., Berlin Heights, O.

From the Ashes!

We wish to state to our friends that we shall be ready to resume operations in the manufacture of apiarian supplies on the 1st of June, 1884. Our capacity for making one-piece sections, 4½x4½, will be 25,000 daily.

E. S. MILLER & BRO.,
Dryden, Lapeer Co., Mich.

ITALIAN AND HOLY-LAND QUEENS.

Fine Queens a specialty, bred from imported and selected stock. Bees by pound; nuclei or full colonies. Send for circular to

W. B. COGGESHALL, SUPT.,
HILL SIDE APIARY,
Sammit. - Union Co. - New Jersey.
11-12-d.

ITALIAN QUEENS \$1.00 each; \$10.00 per dozen. Two-story nuclei, with queens, sent in one box by express, for \$8.00. Now ready.

11. J. H. PROCTOR,
Fairhaven, Vt.

1884. For Sale. 1884.
Pure Italian Queens and Bees

FIVE-FRAME (Langstroth Frame) COLONIES

A specialty. Five bright new combs, wired in, covered with young bees, filled with brood and stores with a pure young fertile Italian queen. My queens are carefully bred from best imported and homebred stock. Bees gentle, industrious, and beautiful; better than a natural swarm. I was awarded first premium at St. Louis Fair last fall over quite a number of worthy competitors for best Italian queens and bees. Send for circular and price list.

5-7-9 11-13-15d WILLIAM LITTLE,
Marissa, St. Clair Co., Ills.

STEAM BEE-HIVE FACTORY OF THE WEST.

Hives and sections of all kinds. Italian Bees, Colony or nuclei; Comb Foundation, Smokers, Extractors. Best and cheapest Saw-Mandrel made; Babbitt boxes all complete, 20 inches long, \$6.00. All Supplies very low for cash. E. Y. PERKINS, 3-13d Jefferson, Greene Co., Iowa.

DADANT'S FOUNDATION FACTORY, Wholesale and retail. See advertisement in another column. 3btfd

Vol. XII.

JUNE 1, 1884.

No. 11.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.99; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 12c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

NO. 55.

SEPARATORS, HONEY-BOARDS, AND L. FRAMES.

FRIEND ROOT, you say that you did not know that it had been repeatedly proven that separators could be dispensed with. Now, aside from private reports, did you not note, in the report of the Northwestern Convention, held last fall at Chicago, that three-fourths of the members could dispense with separators?

You say that the Heddon honey-board is a great deal thicker than the perforated zinc. As used, the zinc raises the sections about 5-16, and the Heddon honey-board about $\frac{1}{4}$ of an inch higher; that is not a "great deal," is it? I have used both, and was unable to detect any difference in the amount of honey stored.

You say, "Now, when we use an L. frame to get our surplus boxes close to the brood-frame, why should we put in a wooden honey-board and two bee-spaces besides, to push the boxes away off again?" I was not aware, that by the use of the L. frame we could get our surplus boxes any closer to the brood-frames. As I understand the matter, the L. frame is used because it secures the brood-nest in a flattened instead of a globular shape, thus securing a larger top surface for boxes, and also inducing the bees, in their desire to keep their combs in a globular shape, to more readily enter and store honey in the boxes placed over the brood-nest. We do not put in a honey-board simply "to push the surplus boxes away off again," but to prevent the build-

ing of brace-combs between the brood-frames and the sections, and, in some instances, it has been put to the further use of keeping the queen in her proper "sphere." You say, that you do not think that you should use the perforated zinc in the production of comb honey, and I will admit that, with some systems of management, I should consider the zinc unnecessary.

LOSS OF BEES IN A CLAMP.

Last fall a large proportion of our bees were fed sugar. Five colonies were left unprotected upon their summer stands, 10 packed with chaff and sawdust in dry-goods boxes, 13 placed in the cellar, and 57 buried in a clamp. One colony left unprotected died of dysentery; about one-half of its stores was honey; the other half, sugar. It was the only colony that clustered on the upper part of the combs, where was the honey, and, it is to this that I attribute the dysentery. One other unprotected colony starved in one end of the hive, with plenty of food in the opposite end. One other strong colony, with nothing except sugar in its combs, perished by inches, so to speak. The bees between the outside combs perished first, starved, or froze, or perhaps both, I don't know; I only know that they were found dead between the combs. Then the bees between the next space would be found dead; and this continued, without the slightest trace of dysentery, until the colony was dead. The other two colonies had about one-third sugar stores. They lived through until spring, but were greatly reduced in numbers. Finally one dwindled away to nothing, and the other became so reduced in numbers that it was united with a queenless colony. For several

years I have experimented by leaving a few colonies unprotected, but I am now satisfied that protection, in *my* apiary, is beneficial. In only one winter, and that was an open one, have the unprotected colonies wintered as well as those that were protected, and in that winter they fared no better than the protected ones; while in severe winters they have either perished outright or been terribly weakened. The colonies that were packed came through without loss. Those having sugar stores entirely, showed but little disposition to fly; and when they did fly they scarcely specked the snow; those having part sugar specked the snow a little, while those with natural stores showed slight traces of dysentery, but not enough to injure the colonies. Those in the cellar came through in pretty good condition. Two colonies, whose stores were largely honey, died of dysentery; others having about an equal portion each of honey and sugar had suffered slightly from dysentery, while those having nothing except sugar were free from it.

As I had previously had such excellent success in wintering bees in clamps, and as the bees in the cellar and those that were protected were wintering so finely, I expected to find nearly every colony in the clamp alive. Never was I more mistaken, and never did I meet a more severe apiarian disappointment, as, when I opened the clamp, and took therefrom, colony after colony, *dead*. But few colonies showed signs of dysentery — those having natural stores — the majority being dry, clean, and healthy looking (?), but *dead*. I think I put too many colonies into one clamp, and covered them too deeply. Many of the hives were almost destitute of bees, the bees having crawled out of them; in others the bees were clustered perfectly natural in the hive, but *dead*. There were 16 hives containing live bees; but in every hive that contained no brood, and there were only five or six that did, the bees at once balled and killed their queens. From 85 colonies we have left only 25; and as luck, or fate, would have it, these are all pure Italians; and as the bees that I have bought are pure Italians, the prospects now are that I can again indulge in that pastime that has become almost "second nature" to me; viz., rearing Italian queens for the market.

A bee-keeper living a few miles from here buried a large number in a clamp, and took them all out *dead*; another living near him buried three, and they came through all right. I should not now advise putting more than 25 colonies in one clamp, nor burying them deeper than 18 inches.

I have just returned from a visit to "Our Clearing," the home of Cyula Linswik and her sister. They were again successful, last winter, in wintering 62 colonies without loss, and I bought and brought home with me 25 of their best colonies. They prepare their bees for winter by packing them with chaff in large boxes; and during 12 years of bee-keeping they have lost only 17 colonies; 15 one winter, and two another, and they attribute their loss to the fact that they were unable to pack their bees, in that particular season, until it was so late that there was frost inside the hives.

W. Z. HUTCHINSON.

Rogersville, Mich., May 1, 1884.

In regard to the zinc honey-boards compared with the wooden ones, if there is only one-fourth inch difference, I confess that that would not be much of an objection. With the wooden frames, and no honey-board of

any kind, we get still nearer to the brood-nest.—In regard to the last part of your letter, friend H., I am very glad indeed that I can so heartily agree with your conclusions. Some years ago I came to the conclusion that for me, outdoor wintering in chaff hives was by all means the safest way, take our winters as they come. My experience has also been like yours in regard to sugar feeding, unless it is the past winter. Our whole apiary came through to the first of May, bright and strong, with no dwindling anywhere, and we have now more bees than we have ever owned before in the world, although perhaps not as many hives numerically. I am sorry indeed to hear of your great loss when most of the rest have wintered so successfully.

DEATH FROM BEE-STINGS.

HOW SHALL DANGEROUS CASES BE TREATED?

I WILL answer a part of the question of W. W. Edwards, asked in your May No., on bee-stings. I will not discuss now, physiologically, bee-stings, but simply the treatment. I will give a typical case. Some 20 years ago I was called in great haste to visit Miss M., a young lady of about 16 years, a strong, healthy girl; had been stung once on arm, not more than 20 minutes previously. I found the patient on the lounge, with head elevated, being fanned vigorously, struggling for breath; entire body was greatly swollen. All clothing fitting about her waist, arms, and limbs, had to be cut off. The pulse was rapid, and therefore could not well be counted, temperature falling; extremities cold and clammy; deglutition very difficult. I gave rum and hot water and sugar (hot application externally) as fast as could be taken; one-half pint was taken within 20 minutes; spirits of ammonia given more particularly to stimulate the heart's action. The more severe symptoms yielded to the stimulants, and a decided improvement was manifest within one-half hour from the time I was first called. Stimulate in every case, and you will hit right in 99 out of every 100 cases.

W. C. BAILEY.

Chatham, N. Y., May 22, 1884.

Quite a number have responded on this subject, and among them several physicians; and the treatment almost invariably recommended is heavy doses of alcoholic liquors—the poison of the alcohol counteracting the poison from the sting. This is an old remedy, and, of course, it has been used extensively for snake-bites and other similar poisons. I confess I feel greatly troubled at the turn the matter has taken, and perhaps some of the friends may think I am a little fanatical when I suggest that, even though life is saved occasionally by getting the patient partially intoxicated, I am afraid that, in the long run, the remedy will be worse than the disease. Suppose, for instance, the decision should be that whisky, rum, or something equivalent, were the best specific in such cases, the conclusion would be, that every bee-keeper should keep a bottle handy for emergency.

The next question is, who shall decide just how alarming the symptoms should be to warrant administering the medicine? Bee-stings often for a few minutes produce such an effect as to frighten the one stung, and may be the bystanders; but as a general thing it will

pass off in a little while by itself. If a heavy dose of liquor were administered, it would doubtless receive the credit, where the patient would have done just as well without it; and who knows but that an appetite for the intoxicant may not result in carrying him to a drunkard's grave?

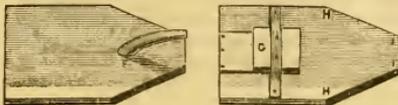

It is not very long since that a friend of mine told me he had tried so many times to break away from this habit, that he did not believe he had the heart to try again, and that the first taste he ever got of it was when it was advised by the doctors when he was in the army. He is now in his grave, the victim of intemperance. Would he not better have died in the army for the lack of it? Of course, we are by no means sure he would have died without it. At one time during the Rebellion, whisky was administered to soldiers because they got stung badly. In a little while the number of boys who applied for whisky because they got stung(?) began to look suspicious, and it was found they got stung on purpose. What proportion of deaths would result from bee-stings, compared with those that result from whisky? This is a pretty "grave" question, and I confess I should like some other remedy.

CLARK'S COLD-BLAST SMOKER.

ALL ABOUT HOW TO MAKE THEM.

THE trade that has now started on these smokers is simply wonderful. When I made mention that we sold ten thousand during the summer of 1883 I thought it was a pretty big thing; but, dear friends, we have sold twice ten thousand already in 1884. Orders for 100 are quite common. In running over the letters for the mailing-clerks, frequently half a dozen, one after the other, will be for smokers, and they are called by all sorts of names, somebody having seen one at his neighbor's and wanting one like it. Yesterday one of the clerks came to me and wanted to know what a man meant by sending for a "bee-tamer." "Why," said I, "that is plain English; he wants a smoker." Now, although smokers are not as bulky goods as sections, and therefore there may not be so much of a reason why they should be furnished at different points that supply-dealers should make their own; still a great many who furnish supplies may make their own smokers at quite a little saving of expense, besides shipping expenses, for they are rather bulky goods to ship, although not very heavy. For the benefit of such, or any who may like to make smokers, rainy days and dull seasons of the year, we give the following particulars in regard to their manufacture:

The first thing to make is the bellows. Two pieces of board, as shown in the cut below, are used for this.

BOARDS FOR MAKING SMOKER-BELLOWS.

These boards are about $6\frac{1}{2}$ long and $4\frac{1}{2}$ wide. The thickness is about $\frac{1}{2}$, or as thick as can be planed nicely when two are got out of an inch board. The lumber usually preferred is basswood, because it is light, and not apt to split. Where smokers are to be made by the quantity I would cut the inch boards into lengths of 6 or 8 feet, split them up 4 or 5 in. wide, as the case may be, split them edge-wise, and plane the pieces on both sides. We put them in bundles precisely as we do the stuff for four-piece section boxes, using the same iron clamps. When clamped, bolts are to be cut off (as in making sections) with a saw large enough to go through. If no such saw is at hand, they may be cut in from each side. After the bolts are cut, a corner is to be taken off, as shown in the cut above.

When the corners of the bolts are off, the whole bolt is to be nicely sandpapered, and the edges of the board planed, so that each board is finished nicely when taken out of the clamp. Just half of the boards are to have a slanting $\frac{1}{2}$ -inch hole bored in them, to put in the blast-tube, and the other half are to have $1\frac{1}{2}$ -inch holes for the valves, to admit air. By far the cheapest way to bore the latter is while the boards are all clamped together. Have a long bit that will bore clean and smooth, and decide, by measuring, when it is through just half the boards. In this way it takes but little time to get the boards ready for a thousand smokers, for they are never handled singly at all.

For the leather, you want some smooth, soft sheep-skin, and the piece needed for the bellows is $2\frac{1}{4}$ inches long by $3\frac{1}{4}$ wide, in the middle, and gradually tapers to only $\frac{1}{2}$ inch in width at each end. You will also want some strips $\frac{1}{2}$ inch wide, and as long as these pieces, for a binding, when the leather is tacked to the boards. The whole of the leather for a smoker should not cost to exceed 10 cents, for we can get a whole piece large enough to make eight or ten smokers for only 75 cts. Besides the tacks, the leather should be fastened to the wood with glue, to get an air-tight joint. The valves are simply pieces of soft leather tacked over the little square boards that cover the hole. In making bellows there will be fragments of leather left that will do for nothing else than the valve.

SPRING FOR OPENING THE BELLOWS.

This is made of coppered iron wire No. 11. The wire is made into straight rods by machinery, and each rod should be $2\frac{1}{2}$ long. They are bent in a lathe as shown in cut.

THE SPRING, AFTER IT IS PUT ON THE BELLOWS.

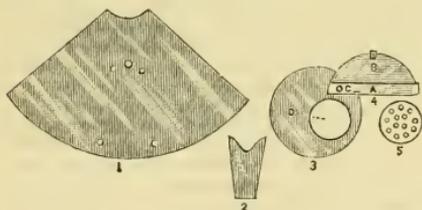

Each arm of the spring is fastened to the bellows by a little wire staple. In the figure the spring is shown held by part of a wrought-iron butt. We find these staples to do just as well. We have never known this kind of

spring to break, for the spring comes on such a length of wire that it is not severe at any point.

Bend your springs so that the boards will come up promptly as far as the leather will allow. To make a neat job, you should put on the leather with wire nails, about five-eighths in length. Put the boards closely together at the end where the hinge is, and tack one end of your long piece of leather. The boards should be separated at the other ends, as far as the width of the leather will allow. Draw the leather close up to the wood, and tack at intervals. Now tack the $\frac{1}{4}$ -inch strip on for a binding. If you wish a pretty job, use red morocco for this last. When your tacks are all in (I would drive them a little more than half an inch apart) you are ready to pare off the surplus leather with a very sharp knife. Finish off every thing neatly with sandpaper, and your bellows is done. The leather has cost us 10 cts., the two boards possibly 5 cts., and the spring 5 cts. more. Allowing 5 cts. for your time in tacking on the leather and sandpapering, you have a good bellows for 25 cts. For this price it should be as good as any thing in the market.

HOW TO MAKE THE TIN CASE FOR FUEL.

For these cases we want a nice quality of IX tin, 20 in. square. Now draw a circle as large as can be drawn on this sheet. We make them $19\frac{1}{2}$ in diameter. In the center of this circle, or disc, with a hollow punch cut out a piece 3 inches in diameter. Now cut the circle into four equal pieces, and you have enough for four cases for fuel. This piece or blank is shown in fig. 1 below:

THE TINWORK USED FOR COLD-BLAST SMOKER.

Before folding those blanks up into cone-shaped cups, you will have to snip off the corners, which our engravers failed to do. The blanks should be put through the rollers so as to fold them first on one side and then on the other, that they may roll up smoothly and evenly when formed and locked together finally.

Fig. 2 shows the blank of which the curved spout is made. It is formed up, lapped at the joint, and soldered, and the tube then bent in a curve while a tapering rod of lead is inside of it.

The blast-tube is made of tin, tapering like the spout of an oil-can. It is made just as large, at the large end, as it can be, and be driven into the board. The inside is then burnished down hard and close to the wood, making it firm and air-tight, and then secured by a couple of heavy annealed tacks, driven through the tin and wood, and clinched.

Fig. 3 is the bottom, with door B attached

by a rivet C. The door is made by cutting in two a circular piece like the bottom, each piece making two doors. The piece A is formed of a strip $1\frac{1}{2} \times 5\frac{1}{4}$, locked into the semi-circular piece on one edge, and folded on the other edge. The end that extends beyond is turned up so as to catch on the bottom of the fire-case, to hold the door securely.

Fig. 5 is the piece of tin that comes out of the door B. It is punched full of $\frac{1}{8}$ holes. The edges are then turned over to make it strong, and it is snapped into the bead, seen in the fuel-case just back of where the bent air-tube enters, forming the grate to hold the fuel.

The fuel-case is fastened to the top of the bellows by means of four screws, No. 8, $1\frac{1}{2}$ inches in length. To hold the case up the right height from the wood, four tin tubes are put over the screws before they are turned down into the wood. These tubes are made of pieces of tin, 1 inch square. They are rolled up with a little steel rod having a crank on the end. A groove in this steel rod catches the end of the tin, which is inserted through an opening in a cylinder in which the rod revolves, thus making it possible to roll the tubes quite rapidly.

Almost any tinsmith has the tools necessary for making the tinwork, and if you show him this description he will readily understand it. In our business we have a pair of squaring shears that cut the large circles by a single turn of a crank, and they are cut in quarters by a pair of tinmer's squaring shears. The holes for the door are also cut by a foot-power press, and the holes in the blank sheet for the screws and blast-tube are also cut by one operation by the foot-power press.

THE CYPRUS APIARY.

SOMETHING RIGHT FROM OUR OLD FRIEND BENTON HIMSELF ON THE ISLE OF CYPRUS.

A FEW words from the native land of the Cyprian bee may not prove unwelcome to many of my countrymen. As perhaps may be known to some, it was quite impossible last year, owing to cholera in the East, and consequent quarantine regulations, which caused the greatest irregularity in steamers plying in these waters, to obtain any considerable number of queens direct from Cyprus. I did get a few; but owing to delays on the way, the shipments were not very successful, and I was obliged to disappoint many European customers who didn't seem to understand why cholera should affect the exportation of bees. After deliberating the matter some time, I concluded that, as it seemed so uncertain whether I could get a supply of queens from Cyprus during the season of 1884 or not, without personally securing them, and as it seemed to me desirable that we should continue the importation of these valuable bees, I would venture upon another journey to the East, in the hope of bringing about these objects. I will not deny, that I hoped the journey might be made remunerative also, which hope I regard as a perfectly legitimate and proper one, and I desire most emphatically to say that this hope of financial gain was by no means the sole thing which actuated me, the unjust accusation of at least one New-York bee-keeper to the contrary notwithstanding. I can truth-

fully say, I have never knowingly misrepresented any race of bees, or expressed any opinions concerning any race, which were not honest opinions, derived from a careful effort to arrive at the real worth of the race in question. Should any one for a moment suppose that, through the sale of queens of any race whatever I ever gained any considerable sums of money, he is most decidedly mistaken; for, had I stuck to my original occupation, that of a schoolmaster, and kept a few hives of bees for honey, or had devoted my time to honey-raising exclusively, I would have been much better off financially than I now am. I beg leave, therefore, to insist that whatever statements I make regarding any race of bees are actuated by a disposition to make known the plain convictions which have forced themselves upon my mind during my experience with various races.

I know of a race of bees that is likely to please the majority, at least, of the bee-keepers of America, and that I can supply with facility; but if any one were to ask for my candid opinion of this race, as compared with Cyprians, I would unhesitatingly give the preference to the Cyprians; yet I would not mean to say thereby that the Cyprians have no faults, nor that the other bees are not good ones. Side by side in the same apiary last year, I found that, during a good harvest, the difference in the amount of honey gathered by strong stocks of Carniolans and equally strong stocks of Cyprians was only slightly in favor of the latter; but as soon as the harvest slackened, the difference was very apparent. The Carniolans lost courage, and not only consumed the stores they happened to have, but went on robbing excursions. Made queenless then, they did not defend their hives well, but fell an easy prey to plunderers. On the other hand, the energetic Cyprians were doubly vigilant in keeping off robbers, scarcely ever allowing one to alight at the entrance, and often they sprang, apparently, into the air a foot to catch the marauders. There was no earthly use for robbers to attempt to gain an entrance into a hive of Cyprians. After the first disappointment at the check in the honey-flow they kept steadily at work bringing what honey and pollen they could find, and continued rearing brood; and it is a fact, that when they were carrying, for their strength in population, *double* the amount of brood that Italians and Carniolans had, they were daily gaining in surplus stores of honey and pollen. Cyprians and Syrians furnish me the most honey, and that is what I presume most people keep bees for—at least, the *main* object in view. All in all, after over four years' experience on an extended scale, most of the time in the Orient, I am decided in favor of the Cyprians as the hardest, most energetic, and stable race of bees yet known, and no one can point to handsomer bees. As a practical proof that I believe in what I say, I will add that I have purchased both the "Cyprus Apiary" of Mr. Jones, and the "Mt. Lebanon Apiary" of Mr. Baldensperger, yet am making Cyprus the chief scene of operations instead of Syria, having greater faith in the bees.

The great question, then, lies in their disposition. All Eastern bees are nervous, quick-tempered fellows; but there is much difference in individual stocks. There are Syrians just as bad as the worst Cyprians, and yet in general I find both races quite manageable—much more so than the Palestinians. I have many colonies at present which I handle without smoke, veil, or gloves, and do not often get stung.

Exceptionally irascible stocks must be weeded out of every apiary. It must be borne in mind, that these races are natural races; that is, their chance surroundings have brought them up to a high point; yet there is still a good opportunity for improvement. We have a most excellent foundation upon which to start—that vital energy and activity so peculiar to the Cyprians (the bees must have completely robbed their masters of these valuable traits), and in twenty-four years—yes, far less time than that—the Cyprians can beat Italians "all hollow;" indeed, they have already done so, having given the largest record yet made. Hold up the Lone-Star banner, friend Carroll; and Michigan, my native State ("once lived in America!"—see *American Bee Journal* for Feb. 27), look well to your laurels.

FRANK BENTON.

The Cyprus Apiary, Larnaca, Cyprus, Apr. 23, 1884.

Friend B., I am sorry to know that any American has been so uncourteous as to accuse you of having left your native land, with the principal object in view of making money. I have not noticed any thing of the kind; but those who know you, and who know friend Jones, certainly would not believe any such statements; and those who do not know you are certainly very uncourteous and ungentlemanly in making any such remarks. People who indulge in such things are usually set down by the world as judging others by themselves.—I am glad to hear your good report from the Cyprians. I do know there is a vast difference in the temper of the progeny of the queens we receive from friend Jones. My past acquaintance with the Holy-Lands induced me to pronounce them very gentle and pretty bees. I have found some queens since, however, whose progeny are as bad as any bees I ever saw. The Cyprian queen that friend Hayhurst happened to get was one of the worst type; and queens raised from her down to several generations show this same vicious disposition. Cyprians reared from other imported queens, however, are almost all that can be desired in the way of temper; and so far as yellow bees are concerned, no one could well be disappointed in that respect.

THE CLOVER-HAY WORM.

SOMETHING ABOUT A NEAR RELATIVE OF THE BEE-MOTH.

A FEW days ago a load of hay was brought into our town, infested with worms, and some of them were procured and sent in a bottle to Prof. Cook. He gives us the following particulars in regard to them:

The larvæ, or caterpillars, which you send are quite a common pest in our country. It is not only found in the Mississippi Valley, but also has attracted attention in the New England and Middle States. The insect is a moth (*Asopia costalis*, Fabr.). Curious enough, it belongs to the same family as does our old acquaintance the bee-moth (*Galleria cecæna*), and shows its kin-ship by the abundant silk it spins. In stacks of hay and in hay-mows it not infrequently mats the whole together with a firm web of its silken threads; so, though it does not surround itself with a gallery, as does the bee-moth, it does nearly as extensive weaving

I have seen these larvæ hang from their silken cords in barns, beneath a scaffold of hay, in such prodigious numbers that, by a single sweep of a hay-rake, one could brush down a thousand. This hanging from a scaffold is not dreaded by these culprits; in fact, they seem to enjoy it. They are specially liable to attack second-growth clover, or after-math. They no doubt do great damage where they are so very numerous.

The moths which these "clover worms" develop into are attracted by light, and frequently fly into our rooms all during the summer months. They are purple, with golden-yellow bands. They are about $\frac{1}{2}$ inch long to the tip of wings, and expand nearly one inch. The eggs are laid on clover hay. The larvæ are gray or brown, often olive color, with brown heads. They are readily told, as on the back of each segment is a transverse line, making it appear like two segments. On each part of each segment are four circular dots, so arranged as to divide the back of the ring into four nearly equal parts. These double segments and dots will always serve to identify the larvæ, if one has a magnifying-glass with even feeble power.

The cocoon is formed right in the hay, of white silk mixed with excremental pellets and pieces of the clover. It is about $\frac{1}{2}$ inch long. The chrysalis within the cocoon is yellow, and $\frac{1}{2}$ of an inch in length. There are probably two or three broods a year. It is quite difficult to fight so numerous and well-concealed an enemy. It has been suggested to build stacks of hay on rails so air could circulate beneath; but from the way they attack hay in barns, I should have little faith in the efficacy of the method. If the hay should be forked over, and pyrethrum sprinkled liberally among it, I should expect the death of the insects. Were it not for the explosive nature of bi-sulphide of carbon, that liquid could be used. By throwing quite a quantity on to the hay it would almost certainly kill the insects. Caution would make this remedy safe, as the absence of all fire till it escaped would make it safe. It would be expensive, however. The vapors of this liquid are heavy, and so would pass down into the hay. I think the cost of the liquid, let alone the nature, would preclude its use.

A. J. COOK.

Lansing, Mich., May, 1884.

BEE-STINGS OF A DANGEROUS CHARACTER.

DR. KEATOR TELLS US HOW A SURGICAL OPERATION MAY PREVENT DEATH FROM SUFFOCATION.

IN response to W. W. Edwards, on page 360, in regard to what can be done in cases of bee-stings that seem to endanger life, I would say that the only cases that are likely to produce alarming symptoms are those where the sting has been inflicted on the tongue or in the throat. In cases of this kind, where the swelling threatens suffocation, it may be necessary to scarify the parts and allow free bleeding, and at the same time apply an ice packing to the throat; and as a last resort, the performing of tracheotomy; *i. e.*, opening the windpipe at the larynx, and the introduction of a tube from the outside; but these cases are so seldom fatal, on account of the short duration of their urgent symptoms, that I think tracheotomy will seldom be required.

Another class of cases where the surgeon is fre-

quently called upon to prescribe, are such as the woman suffered from, as described by Edwards. The probable cause of the single sting causing such alarming symptoms was due to the poison being introduced directly into the blood by the sting entering a small blood-vessel. Under such circumstances the proper treatment is to bathe the part freely with hartshorn, and administer copious draughts of olive-oil—say from one to two ounces every two or three hours, until these symptoms begin to subside.

In cases where a large number of stings have been inflicted, the first thing to be done is to examine the parts with a lens, and extract all the stings. If the shock to the system be so great as to produce syncope, alcoholic stimulants will be called for. Vomiting under such circumstances need not occasion alarm, for it is due to a reaction from the shock, and is always considered a favorable indication. The treatment will be the same otherwise. It should be born in mind, that the poison of the honey-bee is a healthy secretion, and its poisonous effects are due to an irritant acid; hence the alkaline treatment.

Accord, N. Y., May 5, 1884. T. O. KEATOR, M. D.

FURTHER REPORT FROM THE NEW PERFORATED ZINC.

FRIEND ALLEY SAYS IT ANSWERS THE PURPOSE, AND DOES NOT HINDER HONEY OR POLLEN GATHERING.

SINCE writing you about the perforated zinc, I have made some experiments, and find that the Jones pattern will not do as well for the queen-traps as the new zinc. I have, during the past few days, placed the traps, having the new zinc on them, at the entrance of my best colonies, and watched them for results. The weather was quite warm, and the bees were gathering honey from fruit-blossoms. The bees had no trouble in going through the zinc; and no pollen, of any account, was brushed from their legs. The bees pile up some when the trap is first put on; but any one will soon see that they go through, and leave and return to the hive as rapidly as they do when the trap is not used. I am satisfied that the new zinc is a success. Merely placing the trap in front of the hive for a few minutes is not enough to test its workings.

The old zinc (Jones's) has some advantages not thought of. While it will prevent drones from flying, it will not prevent young queens from leaving the hive. Thus, you see, it is easy to have them fertilized by any drones desired.

The device you credit to Mr. Eaglesfield is rather old, friend R. Mr. K. P. Kidder, of Vermont, has a patent-claim on just that thing, but I think it was patented so long ago that the patent has run out. But, why use any thing of the kind, when the bees have no trouble in going through the zinc? If something of the kind is needed, why not arrange tubes for the bees to pass through into the hive, like those in the trap? I will try to get a nucleus from Mr. Ewing, and see how large his bees are. In my opinion he does not leave the trap on the hive till the bees can learn the new way out and in.

Wenham, Mass.

HENRY ALLEY.

Thanks, friend A., for reminding me that your wire-cloth cones will answer the same purpose as the little hanging doors, and they will certainly be less complicated.

HUMBUGS AND SWINDLES

PERTAINING TO BEE CULTURE.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

I SUPPOSE you are all glad, as well as myself, to see that this department has of late been uncalled for, and I am glad to say now that we have nothing pertaining directly to the bee business. There is one matter, however, to which I have called attention before, which I wish to speak of again. It is the electric and magnetic and other appliances for the cure of diseases. One of our old friends and subscribers wrote not long since, that he was paying all his money to some sort of an electrical institution in Chicago for doctoring him. When I remonstrated a little he said they were going to pay his money all back, if it did not do him any good, and I could hardly convince him that his money was thrown away. We copy the following from the *American Agriculturist*:

MR. HART'S EXPERIENCE WITH "MAGNETIC APPLIANCES."

Mr. S. N. Hart, of Southington, Conn., writes us, that in December last he received from a concern in Boston, Mass., "a belt and insoles. Their circular says: 'Bear in mind, we guarantee a cure, and will cheerfully refund the amount paid when they fail doing all that is claimed after reasonable trial.' On Nov. 13th, they wrote me: 'Yes, we will guarantee a cure, or will take pleasure in refunding the money.' On Nov. 19th they wrote me: 'We guarantee to effect a cure, or refund the money.' On Dec. 4th I commenced wearing the belt and insoles, and used them faithfully for ninety-nine days. Neither my wife nor myself were able to see the least advantage from their use, and on March 5th I wrote them to refund the money (ten dollars). March 12th I mailed them another letter, stating that I should send a sight draft. I returned the belt and insoles on March 12th, and can truthfully say that I have had no reason since to think that they ever did me a cent's worth of good. The draft was returned, marked 'refused.'—We have examined numerous so-called 'Magnetic,' 'Galvanic,' and 'Electromagnetic' appliances; and though some make a great display of "hardware," we have never yet seen one that could produce any electric, galvanic, or electro-magnetic curative influence. Any form of electricity, to produce any effect, must pass through the diseased portion of the body, and act on the nerves. None of those we have seen do any thing of the kind. The appliances we have seen consist of

DISKS OF COPPER AND ZINC, OR OTHER METALS,

riveted to India-rubber cloth. That they have sometimes been useful, we do not doubt, as a strip of rubber cloth applied closely to the skin is often very beneficial in rheumatic and other affections, and probably none the less so, if it has some metal disks attached. Very likely the alleged curative power claimed for the various "appliances" is due to the cloth and not to the various metals attached to it, which may serve as ornaments, and aid the imagination of the patient, as they look "scientific." As to our correspondent's failure to get his money back, what can he expect from one who will propose the impossible—"guarantee to effect a cure"?

We commend Mr. Hart's example to others. He has a charge to make, and makes it boldly, without adding, "please do not use my name." We can understand why, in many cases, persons should not wish to have their names appear; but in instances like the above, where there is a direct failure to comply with an agreement, and there is nothing of a delicate nature involved, correspondents should be willing that their names be given. A warning,

substantiated by a name and address, has far more influence than when initials only are published. Still, where our correspondents indicate a desire to avoid publicity, their wishes are respected.

This whole matter of curing diseases by the use of such things as mentioned above is ridiculous, and a disgrace to modern civilization. Any one conversant with the laws of electricity or magnetism can tell you that the idea is as absurd as the old superstition of nailing a horseshoe on the door to insure good luck. Electricity has its place in medicine; and in the hands of a skillful and intelligent physician may no doubt prove beneficial. Its value in medicine has, however, been greatly exaggerated, even when used intelligently; and, if I am correct, shocks of electricity have just about as much of an effect on a rheumatic patient as would rubbing or pounding, or any other form of starting circulation. The whole business is a swindle from beginning to end; and yet thousands of people are wasting or handing over their hard-earned money from day to day to unscrupulous swindlers. Newspapers and journals are giving place to their advertisements that ought to be ashamed of themselves.

HOW I LOST MY BEES.

ARTIFICIAL HEAT FOR WINTERING.

MOST of the readers of GLEANINGS are doubtless aware that I usually winter half of my bees out of doors, packed in chaff, and the other half in a bee-cellar, built especially for wintering bees. Last fall, as usual, I set half of my full colonies in this cellar, together with about 20 queen-rearing nuclei, which were small, the most of them (nuclei) having but three combs each. The full colonies were strong, and had at least 25 lbs. of honey each, as all were weighed in October. Those left outside had the same amount of stores; but before March 1st, I found one starved to death—a thing which has happened with me but once before since I kept bees. During March, one of those out of doors died with the dysentery, which was the only one that showed any signs of the disease. This colony was a Cyprian, the queen having been sent me from Texas last June. They persisted in breeding all winter, which I think was the cause of their death. One other starved during a cold snap in March, with honey in the opposite side of the hive, they having a Hill device over the frames; so I lost three, all told, of the half left out of doors. Most of the remainder are in good condition.

But my heavy loss was in the bee-cellar; and to tell how it came about is the object of this article. The cellar was dug in a side hill, so that it could go deep into the ground, thus securing an even temperature, which was 42° winter after winter heretofore, not changing at all, no matter if the mercury went to 20° below zero, or stood for a week at 0° above. Leading into this cellar were three doors, inclosing between each two doors a dead-air space of two feet, which kept the cold, or warmth, as the case might be, from reaching the cellar. In this cellar I have been quite successful in wintering my bees, till the past winter; and I think I should have been this, had I been contented to let "well enough alone."

The bees were all set in Nov. 20. I went in the next night after setting them in, to see how they appeared. All were quiet and nice, with now and then a colony being partially clustered outside, similar to what they do in very hot weather in the summer. Looking at the thermometer, which is always kept hanging in the cellar, I found that the temperature was 56°. As the bees seemed so quiet and comfortable at that degree of heat, and remembering that L. C. Root and others had recommended 56° as the right temperature for cellar wintering,—Ira Barber even saying that from 65° to 90° was what it should be,—I fell to wondering why it would not be a good plan to keep the temperature at an even 50°, if possible, instead of letting it go gradually down to 42°, as it always did after the heat, caused by the excitement of the bees during the process of setting in, had subsided. This certainly would be nice for the nuclei, I thought, so I told Mrs. D. I was going to try an experiment with the bee-cellar, by placing an oil-stove between the two doors nearest the cellar; and by turning the wicks up or down I could regulate it to perfection. She expostulated, by saying that she thought I was risking *too much*, for heretofore I had never attempted to experiment with more than two or three colonies at a time; and thus if the experiment proved a failure I had but a small amount to pay for the knowledge gained. I told her it would hardly seem that L. C. Root and others could be mistaken; and if I tried the thing at all, I must try the whole, for there was no way to try a few. She reluctantly consented. So the next day I placed the stove between the doors; and as the temperature began to lower in the cellar, I lighted the wicks of the stove. At first I had to turn the blaze very low, in order not to get the temperature higher than 50°; but after a little it took more of a blaze. I soon ascertained that I wanted to keep the temperature at 77° between the doors, to have it 56° in the cellar; so after this I went into the cellar only twice a month, that being on the 1st and 15th of each month. I had no difficulty in controlling the temperature to within a degree or two; and as zero weather came on, the sight of the condensed vapor from the upper ventilator, rolling off like a cloud of smoke from a chimney over a wood fire, made me feel quite exultant over my experiment, for nearly all the damp, foul air was being carried off from the cellar, to perfection.

I had no thought but that the experiment would prove a success till Jan. 15th, when I happened to think that I would look at the bees under the quilt at the top of the hive. Those clustered below the frames, and on the outside of the hive, seemed so quiet that I supposed those inside would be in that semi-dormant state they always were in in the cellar in the winter; but, to my surprise, as soon as I raised the quilt they were ready to fly at the light, and on to me, instead of being apparently lifeless. I left the cellar feeling a little disheartened, but thought that, of course, the 8° higher temperature would cause them to be thus lively. February 1st I found dead bees thickly strewn on the cellar bottom, of which, previous to this there had been far less than I had ever known before, and most of those clustered outside had disappeared. I began to feel despondent over the matter, but thought if I then took the stove away I should surely lose the bees, so I kept the fire going the same as I had.

The 15th of February matters were still worse; and on the first of March several were dead, while

the dead bees on the cellar bottom were nearly two inches deep. I now took the stove out, for I saw it would be sure death to all if I kept the temperature longer at 56°. By the 15th of March the temperature had gone down to 47°, and on April first it stood at 45°. I now began to set them out, and, much to my surprise, I found, upon taking the frames out of those which had died first, that the temperature had been high enough so that the moth larvæ had taken possession of the combs, spun their cocoons, and passed to the chrysalis state, and some even to moths. Upon getting all set out about April 20th, I found that four-fifths of the full colonies were dead, while three-fourths of the nuclei were alive.

Well, I have learned something; but the cost is greater than I wished to pay. It would have been more pleasant to have passed over this without telling of it, but I think it no more than just that I give all my reverses as well as my success. I give the above as a caution to all. If you have a plan of successful wintering, stick to it, and don't be so foolish as I have been in trying to learn something good, to try an uncertainty. In the above I have given the facts, and probably different opinions will exist as to the cause of the failure. My opinion is, that the bees were uneasy inside of the cluster, and, by a constant stirring, wore their life away, so that by the middle of January they began to die of old age, thus leaving their hives as all old bees do when the temperature is high enough so they can. Some of the hives did not have twenty bees left in them, they all went out so clean. In one I found eight dead bees and the queen in a little cluster, while, scattered over the combs, were nine more. Out of all this loss there was one very noticeable, and, to me, quite consoling fact, which was, that in this cellar I had several colonies whose queens I had purchased or exchanged for last June and July, also some Cyprian colonies, and quite a large number of hybrids. Nearly all the above died, while the larger proportion of my best Italians, which I have spent years in breeding, survived. In this I have some consolation at least. G. M. DOOLITTLE.

Borodino, N. Y., May 12, 1884.

Well, friend D., it seems a little singular to think that you and friend Hutchinson have both lost, when others have done so well, and also that you both lost by cellar wintering, if so we should term it. I confess I am a little surprised to think that you should make so rash an experiment, and I am glad to know that your good wife did protest against it. I tried artificial heat in the house-apiary a good many years ago, and I thought my coal-oil stove, or, rather, a large coal-oil lamp, was just the thing; but my bees in the house-apiary all played out about as yours did, while those outside, that were let alone, got along all right. I am glad that both of you come out so frankly and tell us of your reverses, and I heartily approve of your injunction to the A B C class, to let well enough alone. I think it quite likely, however, that L. C. Root, with his arrangement for getting a temperature of 50°, would get along all right. Are you sure you had a sub-earth ventilator that gave a sufficient volume of air for so many colonies, and with a temperature a few degrees higher than you had formerly kept it? Would not plenty of fresh air have made it all right? Of course, this is merely a suggestion.

ENAMELED SHEETS FOR COVERING FRAMES.

SOME SUGGESTIONS AND CONSIDERATIONS IN REGARD TO THEM.

THE enameled cloth has often been a great bother to me, because it can not always be kept tight at the edges. If the bees once find their way to the upper surface they commence smearing it with gum, which, in drying, shrinks and rolls up the edge of the cloth. Then the bees gnaw the edges, making them notched, and soon the cloth becomes unfit for its designed use.

Now, I have a contrivance to remedy this trouble, that I am greatly pleased with. It may not be new, for I see that many a new-fledged bantling proudly sent to you, is pronounced *old*. Neither do I call it an invention, for it is only a modification of the shingles, and wooden and tin binding that we have all used. I send you by this mail one of the articles; and if you judge it to be old or useless, then cast aside that article and this article.

DESCRIPTION.

Take some strips of soft wood, about $\frac{1}{4}$ by $\frac{3}{4}$ in., and of sufficient length, and miter them to fit rather tightly inside the top of the hive, lying flat on top of the frames. Then take your old enameled cloth and cut off the worst side and end until it is a little smaller than the hive all round—say $\frac{1}{4}$ inch. Place the sticks in a hive in proper position; lay the cloth upon them, *black side up*, and tack it to the *side-pieces only*. It is then exactly right to fit when turned over with the black side down. Use very small tacks. Place two movable gauge-pieces in your miter-box as a measure in cutting the pieces, when you find the proper length. This device is most convenient with weak swarms, and in cold weather, when there are few bees in the way, and is then especially useful, as it can be made about air-tight with very little care, and effects a great saving of warmth. When not in use it is easy to roll up and store in small compass. After a trial of more than a year I write this.

JOEL A. BARBER.

Lancaster, Wis., May, 1884.

I will explain to our readers, that friend B.'s device is four sticks put together exactly like a picture-frame: that is, they fit together at the corners with a mitered joint. The side-pieces are fastened permanently to the enamel cloth, while the end-pieces are movable. I used something similar years ago; but as I dislike loose pieces or sticks that may get lost, anywhere about a bee-hive, I discarded strips along the sides, and used only the tin-lined ends. Where one takes care to put these down nicely in place, bees seldom if ever go up along the ends; and to prevent their notching along the sides we have the enamel cloth hemmed, and also made on a curve, bowing outward, as you may have observed. This gives a surplus of the sheet right in the middle, just where bees are most apt to push through. When the sheet is new and first put on, one may be inclined to think it might not stay down in place. But you can make it do so by taking a little pains. The next time you open the hive you will find the sheet has got settled, as it were, into such a position, and goes back there very readily. Letting bees get up under the cover in any hive is a very

bad feature indeed. We have what I consider a very careful apiarist now, but yet I heard the "bones crack" a few days ago when he went to put on the cover of a Simplicity hive. Three or four of the little yellow chaps had naturally pushed their heads out, and stood on the bevel. There they were, their poor little innocent bodies quivering in agony, just because of his want of care. When I spoke to him he raised the cover up and fixed the mat; but by this time the colony, which could have been handled easily without smoke, had become pretty furious, and I could not blame them. At another hive, I noticed, when I set a frame back, it touched bottom and mashed bees. When I told him, with some emphasis, that I would not have that kind of work *anyhow*, he asked what I would do. I told him I would pull out that frame and measure it. If it was over $9\frac{1}{2}$ inches, to have it fixed before going any further. But if it transpired, however, that the hive was at fault, either have the hive fixed by raising the rabbet, or make kindling-wood of it.

And now, my dear friends, I am sure I am right in saying that we have no business killing and crushing bees. If you don't get quite so much money by going slow and careful, where their lives are in danger, you will have more "clear conscience," which is immeasurably of more value than money or any thing else that money can buy. In view of this, I think it will be an excellent idea to adopt friend B.'s device whenever your enamel sheets get old and ragged around the edges, or have your new ones made so, if you like. I do like to see a hive that can be shut up quickly, and so securely that not a bee can even look out and make faces at you.

ITALIAN BEES AND RED CLOVER.

AN OLD SUBJECT RECONSIDERED.

See May number, pages 299, 300.

I HAVE kept Italian bees for 15 years, as many as 40 colonies at a time, in a location where red clover abounds, but I have never yet seen one pound of red-clover honey. I have watched the red-clover fields when they were a sea of bloom, year after year, without finding Italian bees working upon it. I have closely watched the second crops of bloom upon red clover in all of its various stages, and have never seen bees work freely upon it at any time. I have seen bees work some upon the second crop of red clover, but I have found as many black bees, in proportion to their number, working upon it as there were Italians. I have never been able to find enough red-clover honey in a hive to tell what it looks like. Such has been my experience when I hoped and expected it to be otherwise.

I will not dispute, that Mr. Roof's bees "do gather honey in large quantities" from red clover, nor that the failure of his bees to do so is the exception, and not the rule, as he tells us. But, not only from my own experience, but from all that I have seen upon the subject, I firmly believe that nine-tenths of the candid bee-keepers of the country will agree with me, that where Italian bees gather honey in unappreciable or merchantable quantities, from red clover, it is a rare exception and not the rule. Where

Italian bees have been found working upon the second crop of red clover, black bees, when in the vicinity, have also generally been found working upon the same. I appeal to brother bee-keepers, to know if this is not a fair statement of the case. If so, is it "unjust" or "unkind" to say that it is deceptive to induce people to buy Italian bees, with the expectation of getting surplus honey from red clover? I am not discussing the superiority of the Italian bees over the black, or any other kind: I am willing to grant their superiority to all other kinds, but I dispute this one point claimed for them.

Great interest has been manifested of late in honey-producing plants. We have honey from white clover, from alsike clover, from willow, from basswood, from black-locust, from buckwheat, golden-rod, corn, etc., all of which I have seen and tasted. Then there is the California sage, the Texas horse-mint, and the Canada thistle, and other kinds that I have not seen. The most of these kinds of honey have been upon the market—offered for sale, properly designated after the source from which it was gathered. Red clover is grown over a greater area of country, and in greater quantities, than any one of these honey-producing plants, and there is now no lack of Italian bees to gather the honey from it. But there is no red-clover honey offered for sale; or if so, it is but a rare instance. I should like to know of friend Muth what proportion of honey he handles is from red clover. Acres of alsike clover are now being sown where red clover and Italian bees abound. One of our most intelligent keepers of Italian bees has been patiently trying to produce a red clover that his bees could get honey from, by selecting seeds from a short head of clover, and carefully planting them, year after year, virtually admitting that his Italians did not usually get honey from the common red clover of the country.

Not long since, a queen-breeder called one of his queens the "red-clover queen," claiming that her progeny got honey from red clover when other Italians did not. Was not this an admission, also, that it is unusual for Italians to get honey from red clover?

With these statements I am now prepared to answer friend Root's question. Yes, sir, from conscientious convictions I believe such a statement deceptive; and I say it without the least "unkindness" to any one who may differ with me; and with my convictions it *would be* "unjust" in me to induce any one to get Italian bees with the expectation of getting surplus honey from red clover.

THADDEUS SMITH.

Pelee Island, Canada, May 10, 1884.

Our bees work on red clover here in Ohio every season, in June and July. I have seen it throughout different parts of our State; and bee-keepers with whom I have conversed often, give it as their opinion that more honey is gathered from red clover than white. Of course, there are times when the clover-fields are almost unnoticed in the fall of the year; but of late years such times are not very frequent. Perhaps the different observations you have made may be owing to the different kinds of clover. With us the bees are always at work on the pea-vine clover. I don't think I ever saw an exception. Of course, you have noticed what has been said about it. It is so common a thing to see blacks and hybrids working on buckwheat, and storing dark honey while Italians

are working on red clover, and storing white honey, that it has been frequently reported, and it is mentioned in the A B C book. Of course, I do not mean to say that in our locality we get enough honey in the fall to have it stored in sections every season, but that the bees are seen busy on the clover, and the honey is found in the brood-apartment, affording honey to keep up brood-rearing, and often for winter stores. The queen which I called the red-clover queen had her hive full of solid sealed stores of white honey, while almost every other colony in an apiary of toward 300 had to be fed. I called her the red-clover queen because her bees seemed to mass more, while the seed crop of red clover was in bloom, than any of the rest of them.

Some years ago we used to have visitors who would announce themselves something like this: "Mr. Root, will you please show me Italians working on red clover?" If they came at a season when clover-fields were in bloom, I have never failed of convincing them. During the months of June and July they almost invariably admitted there were more bees to be seen on red clover than on white. It is on this account that I have recently had our honey-labels read "clover honey," instead of "honey from white-clover blossoms," as we used to have it. The term clover honey covers white clover, red clover, and alsike. Some bee-keepers claim to be able to distinguish red-clover honey from the white; and I have sometimes thought I could distinguish a little difference. The difference is so small, however, that I believe it has been mutually agreed it is not worth mentioning. At our conventions, sample jars of red-clover honey have been exhibited quite frequently. On asking how they decided it was red clover, the reply has been, "It was gathered when no white clover was in bloom."

POLLEN, AND ITS RELATION TO DYS-ENTERY.

ANOTHER PROOF THAT BEES DO NOT NEED POLLEN IN WINTER.

LAST fall I prepared 25 stocks of bees for winter in chaff hives, and 20 more in single-wall two-story hives—bees in lower story, and chaff cushions in upper one. These 45 stocks graded all the way from very light to very good, both in quantity of bees and stores. All had the same combs left in that had been there during the season, so without doubt all had more or less pollen. Then I put up 7 small queen-rearing nuclei the same as I did a year before (see GLEANINGS for June, 1883); that is, in a long hive that would take an L. frame crosswise, generally using three combs, then a thin wooden division-board. One comb would be empty, and two well filled with honey; but I took special pains to see that they contained no pollen. Over this hive I put a rough box, giving about 4 inches of space all around said space; filled with chaff, with passage-ways for each lot of bees to fly out, then I put up 7 more about the same, only these combs were about 11 inches square, and about entirely empty. I do not think there was 2 lbs. of honey for the whole 7 nuclei.

It was in December before I got these put in, and only a few days before our steady cold weather began, and I think it was cold—27° below zero. I wish I knew just what the bees in each of these 14 stocks did weigh; but I do not think one-half of them had more than one pound of bees each, and not one of the lot that had more than 2 lbs. Of course, each one had a queen. During the cold weather I was frequently asked, had my bees stood it, and I would say that I expected to find quite a lot of them dead. I grew somewhat anxious; so one day when it was not quite so sharp, I raised the lids of one package, then one corner of the quilt. Buzz-z-z-z! Down went the quilt; down went the lids; they were yet alive.

About the 20th of January I could discover that the bees in the regular hives began to need a flight; by the 25th the situation was getting critical. Dysentery was developing badly; in some cases the bees were leaving their cluster, and dying. I was growing anxious for a warm day, and it came just in the nick of time. The 31st of January was clear, bright, and warm, and the bees improved it, for all in the regular hives flew freely from 10 to about 2 o'clock, at which time they had nearly all stopped, but not quite.

I had several times passed through the apiary, and up to this time the little stocks in the compartment hives had not shown themselves much, only one or two flying at all; but being anxious that they should, I opened both lids out flat, and took off the cushions, which were of *white cloth*—note this—and dropped them in the lids, then turned up a corner of each quilt or cloth, and left them so that, in half an hour, I looked out, and my first impression was that they were robbing, for there was such a swarm of bees flying there; but on getting nearer I saw that all was right. An hour later and all was quiet. I then went round and looked at every hive in the apiary, and every one of the 45 had the spottings of dysentery, pure and simple, if I know what dysentery is, and I ought to, having lost over 100 colonies in former years. Lastly I came to the nucleus stocks, and I got right down close, and looked sharp, and especially on the white cushions, and found two spots on one, and only one on the other. Then I could swing my hat and shout, "Eureka! eureka! I have found it! I have found it!" The true cause of the dread disease, dysentery, is pollen! The 14 were all dry, healthy, and as lively as one could wish for, and are to-day, May 13th, all building up as fast as can be expected. The 45 in regular hives were not troubled any more with diarrhœa after that cleansing flight of January 31st. All have lived through, but some are quite weak.

The above facts clearly prove to my mind that pollen is the prime cause of diarrhœa, for 45 stocks that had pollen all had it, and 14 that had no pollen had no disease, as I fully believe that the three spots found were dropped by bees from some other hives as they were flying over. But, hold on; you will ask what those seven little stocks lived on that had no stores. Why, I just raised the lids and put about half a pound of pure extracted honey, *candied hard*, right on the frames over the bees about twice a month, and that is all. A. A. FRADENBURG.

Port Washington, O., May 13, 1884.

Many thanks, friend F., for your very careful experiment in this matter. I am also glad to know that candied honey laid on top of the frames is a safe way of feeding for

winter. If bees fed in this way come through healthy, and without any trace of dysentery, simply by giving them combs to winter on, entirely free from pollen, it is certainly quite an important matter. We have had many reports before, demonstrating that bees would winter entirely without pollen, but you have shown us that nuclei without sealed stores came through in better condition than even full stocks prepared in the usual way with natural stores. If this can be done every time, it would be quite an important matter, because it enables us to winter over valuable queens without being obliged to take a full colony for each. Had you given one of these nuclei, or several others similarly prepared, combs well filled with pollen as well as honey, the experiment would have been still more conclusive.

A MODEL BEE-KEEPERS' CONVENTION.

PROCEEDINGS OF THE NORTH-WESTERN OHIO BEE-KEEPERS' ASSOCIATION.

THE association met at the residence of S. H. Bolton, in Hancock Co., O., according to adjournment, on Friday, May 9, 1884. The day was all that the most sanguine could wish for; the attendance good, and a very enthusiastic and interesting meeting was the result.

The president, Jacob Guisinger, called the meeting to order shortly after 9 o'clock A. M.; and as the meeting was for practical work in the apiary, the committee on programme announced the following as the order of business:

Transferring of bees; the first hive to be transferred by Frank Eaton, of Bluffton; the second by the president; and the third by any one wishing to try his hand at the business.

The forming of nuclei.

The introduction of queens.

Those present then adjourned to the apiary (which, by the way, is a very nice one, containing 52 colonies, situated on a green lawn facing to the southward) for work, or most of us to see how work could be done. Mr. Eaton being absent, the first work fell on Mr. Guisinger, who, with the necessary implements for such work, attacked an old-fashioned box hive of huge dimensions, and in an incredibly short time had the bees and such of the comb as was fit, encased in two hives of the latest improvement. The little bees were somewhat confused at first, but soon went to work fixing up for house-keeping in their new home, which they will undoubtedly enjoy better than they did their old one.

Mr. Eaton having arrived, he went to work to try his hand on (with the exception of a top and bottom, and a few sticks placed crosswise) "nature's own hive," an old linn gum, and in a very masterly way accomplished the work assigned him. This completed, the association adjourned for dinner.

Just at this time quite a cluster of bees was noticed on the body of a large cherry-tree, which attracted the attention of all present. On examination it was found to consist of worker-bees heavily laden, and others still alighting, and seeming as contented as if in their hive; the topic of discussion now was, "What attracted the bees to this place?"

After partaking of a bounteous dinner, prepared for the occasion by the "better halves" of sirs Bolton

and Guisinger, and the lady friends present, all took a view of Mr. Guisinger's apiary, which is but a short distance from Mr. Boulton's. This apiary contains some thirty or forty colonies, and shows by its condition that its owner has not been *astleep*.

All then returned to Mr. Boulton's, and the third hive was transferred in about 15 minutes. The remainder of the programme was carried out by different parties.

Ottawa, O., May, 1884.

F. M. BLAKEMAN, Sec.

WHAT TO DO WHEN YOU WANT HONEY RATHER THAN BEES.

PROF. COOK GIVES US SOME IDEAS IN REGARD TO RESTRAINING INCREASE.

I HAVE just been reading in the *Rural* that Prof. Cook recommends putting new swarms into other hives, to prevent increase. Now, if not asking too much, please inform me how he does it without having the old colony destroy the new.

E. E. BABCOCK.

Elroy, Juneau Co., Wis., May 12, 1884.

Prof. Cook replies as follows:

For several years now we have prevented increase of colonies when desired, with few exceptions. In nearly all experience with bees, rules have quite enough exceptions to verify them. Our method, as given in the *Rural New-Yorker* several years ago, is as follows: Our first colony that swarms leaves hive No. 1, and is hived in a new hive. This, of course, gives one increase. Swarm No. 2 is hived in hive No. 1, after the queen-cells in the latter are ALL carefully destroyed. The few bees now in this hive make it easy and quick work to find and destroy every queen-cell. After swarm No. 2 is given to this hive, the latter will contain the old brood with the few bees left in the hive, and the second swarm with its queen. Thus the colony is just as strong as before, only, as the bees are in a new hive, and in a changed position, they seem satisfied, and will proceed to the business of storing, and the swarming impulse will be cured, and will very likely not appear again if proper room is given. When colony No. 3 swarms, the swarm is hived in hive No. (2), colony 4 in hive 3, etc.

Sometimes, rarely, this has failed to bring success. In such cases I think it is likely the hive was suffered to become overcrowded; or, from lack of shade, possibly overheated. Unless sufficient room is given by extracting, or by giving abundant sections, swarming will always occur in times of a great honey-flow. It is also true, that colonies will swarm out of hives which are overheated, so that these two points are to be carefully heeded or else the above method will not avail. The leaving of a queen-cell may also tend to disquiet the bees; but on the whole, this plan is one of the best, if we desire to leave the queens in all the hives, and at the same time preclude increase of colonies.

Lansing, Mich., May 21, 1884.

A. J. COOK.

Thanks, Mr. C. I believe the above answers nicely, unless the bees get the swarming mania, such as friends Hasty, Doolittle, and others have written about. In that case they overstep all the rules laid down, and do about as they please, even to swarming without the queen—at least, I believe some claim they do. So far as reports are concerned, I believe the above process, as you say, about the best plan we have, especially for one who has had but little experience in the matter.

BEE CULTURE IN KANSAS.

Another Plea for Hybrids.

FROM ONE TO 13 BY NATURAL SWARMING.

WE submit our report for last season. We closed the season with 46 colonies (14 colonies spring count), and 2500 lbs. of honey, mostly extracted. Last fall we sold eleven colonies, leaving us 35, all of which wintered in good condition. Two colonies were queenless; 12 were wintered in the cellar, and the rest on their summer stands, and all protected with chaff above, and hay packed around the hives. Those wintered in the cellar came through about twenty per cent the best, although our cellar is a very cold one. The mercury stood between 30 and 45° the most of the time, and at one time as low as 28.

From our experience and observation last year, W. Z. Hutchinson said in GLEANINGS, some time early last autumn, just about what we were going to say. That is, we do not want any more metal-cornered frames in ours; that hybrids are the best workers in the sections, and that natural swarms have the "get up and get" to fetch in the honey, and are not half the trouble of any other means of increase that we have ever tried. Last season we started out to work for increase in the main, but we didn't intend to refuse any surplus honey. We did not expect to get nearly as much in the outset as we did. We made a few nuclei in May, about the same time the bees swarmed. We did not take brood to build up the nuclei. We kept them booming by feeding till the first of June; and from that time on until about the first of August, they made enough to live on. Then came heart's-ease, which lasted about 4 weeks, and from which we obtained our surplus.

Another thing we wish to say in favor of hybrids over the pure Italians. With the former, in future, we shall not feel so nervous when the sections are ready to cap, fearing they will come out, as we shall when the Italians are in the sections. With us they swarm too much; for instance, one pure Italian queen came out with four swarms during the season, as follows: May 24, June 28, July 12, Aug. 26. This queen and her swarms increased to 13 strong colonies, and they would have probably increased to 20, but we stopped several swarms by taking their queen-cells, extracting all their honey, and scattering their brood in the upper and lower stories. We couldn't keep this strain of bees in the sections until they were finished, at all. The old queen of this lot left the sections mostly full of brood on different times—the only instance we ever found brood in the sections. We had, during the season, 20 natural swarms. We gave a frame of brood to some of the first swarms, but not all; lost more by absconding. The first swarm came out the 24th of May; the last swarm, the 10th of September; highest yield of extracted honey from one colony, 208 lbs. (1 hybrid May swarm), 72 lbs. in 1-lb. sections. Best yield was made by a second swarm, which came out the 21st of June, so you see an after-swarm in May or June in this locality is not to be grinned at, if they have a good queen. Bro. Root, don't you think we had good luck? If there was any luck, I know we had to work mighty hard for it, and putting out feeders after almost every one had gone to bed, and taking them up at daylight, sponging off the

alighting-boards to prevent robbing, keeping things right up, and neglecting nothing that should be done. Hard work, real backache work at times, and your two A B C scholars of two years ago have not learned it all by a long way, but we have learned one thing; as somebody said, it takes eternal vigilance to succeed in bee-keeping in Kansas. You have got to be on hand with your eyes and ears open, and your sleeves rolled high up.

Now, Bro. Root, I have said *we*; but to be frank about it, I am like the fellow who killed the bear. My wife did most of the work in the apiary herself, last season.

The imported queen and 9 oz. of bees we received from you the 30th of last June built up on two frames of brood, and gave a surplus of 5 lbs. of extracted honey from the upper story. We think lots of her. They brought in the first pollen of all our bees. Her hive is full of brood. Drones are hatching, and the indications are she will swarm the first of all. The spring is cold and backward; the first pollen came in the 21st of March, 8 days later than last spring. We sold our extracted honey at 16 to 20 ets. per lb.; comb honey from 20 to 25 ets. per lb. All is sold except some we are keeping for feeding. We are going to feed frames of honey instead of syrup this year.

M. F. TATMAN.

Rossville, Kansas, April 21, 1884.

Yes, friend T. I do think you had good luck; and what I admire about your article is, that you tell just how your luck came about, and it will be a recipe whereby your neighbors and everybody else may get it. It is true, one has to work and scratch for good luck, but that is the nicest part of it. "In the sweat of thy face shalt thou eat bread." etc.

BEE-FEEDERS, DOCTORS, BEE-KEEPERS' HATS, AND —.

STILL ANOTHER IDEA IN REGARD TO BEE-FEEDERS.

MY most satisfactory feeder is a vessel with a float; but as I am not fully satisfied with any feeder noticed in GLEANINGS, A B C, or elsewhere, I have constructed—in my mind—the "Ideal" feeder—a tin can, long but shallow, with an outlet for the honey or syrup, so large as not to be easily clogged by notes (say $\frac{1}{4}$ inch), but the outlet regulated by a pinhole for air in the top (atmospheric pressure).

WHAT KIND OF A HAT SHOULD A BEE-KEEPER USE?

Some time ago I concluded my bees were degenerating in amiable traits, so many of them tried to sting me as I sauntered about the hives. Now they are all right again. What is the explanation? A change of hats. Every bee that flew against my straw hat got raving mad, and went for me with persistent fury. As soon as I suspected the cause, and substituted an old soft wool hat for my straw one, they would bump and bump against it without losing their temper.

MRS. COTTON'S \$4.00 OUTFIT.

I fully expected to be in Blasted Hopes; but my few colonies are doing well. The first money I ever spent in bees was \$4.00 sent to that Maine woman. That money was "blasted hopes," although I have not tried her system. I could not employ an architect to construct one, and so lost my money.

A BEGINNER.

Friend B., as a rule I am opposed to theory without practice; but this time I believe you have constructed a pretty good thing in your mind. I am going to claim priority of invention, though, after all. Just listen. Years ago, when I had feeding on the brain, to use a little slang, I purchased a tight alcohol-barrel and dissolved a barrel of coffee sugar in water and poured into it. I arranged a shallow tin vessel, perforated on the bottom, and attached to the stem of a molasses-gate, so I could screw it into the bung-hole of a barrel. While the syrup stood by the side of a bee-hive, this shallow feeder lay just between the upper and lower stories of a strong colony. The idea was, they could help themselves. In course of time, however, the syrup did not get out fast enough; and to facilitate matters I bored a gimlet-hole in the upper side of the barrel. Of course, the air went in, and with such force that it made a shrill whistling noise. By plugging this hole I could give the bees feed just when I wanted to, and just as fast as I wanted to. In case it came too fast I had an empty hive underneath, waxed so as to hold syrup, and in it a float. With this arrangement I made the bees build combs, and fill them, and seal them over, and these combs were then given to colonies needing stores. The arrangement worked beautifully; but as I did not commence it until frost came, a good deal of syrup was consumed in keeping the whole establishment up to blood heat, or pretty near that, so as to keep comb-building going on. Quite early, during a frosty morning, the vapor would ascend from this hive, as we often see it rise from a manure-heap. Now, although I discovered that letting air in, in the way I have told you, regulated the flow of honey, it never occurred to me before that we could take advantage of this. If you let syrup through a small orifice it soon becomes clogged or gummed up, but I believe air would pass through the smallest pinhole, and never clog. Who will work out the idea?

I believe the kind of hat makes a difference, but it seems to me you have got it the wrong way about. A few mornings ago bees flew at my soft drab felt hat, and stung it so full of stings that I meditated pulling them out to sell to the doctors. By the way, did I ever tell you the doctors are buying up bee-stings? Friend House sold 1000 stings for \$5.00 a few days ago, to be manufactured into medicine. I did not taste the medicine, but I have no doubt it was good. If doctors are ever in need of something that will "take hold," I should think "extract of bee-stings" would just do the business. Whether they use it for curing rheumatism or not, I can not say. I throw out the suggestion as a new department to our industry. It occurs to me just now, that friend House said I shouldn't tell of it; but you see it is too late, as I have got it all written down. Now, then, about the hats. What kind of hats are least obnoxious to bees, especially when they are spoiling for some cause for getting up a fight?

I do not know but I might have said something about your concluding item, friend B.; but you see you have moved me to talk al-

ready more than my share, so I think I will stop right here and not make any comments in regard to your \$4.00 investment.

P. S.—It just now occurs to me, when you settle down on the most appropriate hat for a bee-keeper to wear, we ought to have them for sale in the counter store, and I was thinking of putting them on the five-cent counter; but the prospect for honey is so good now I do not know but we might afford to go a little higher, if we could succeed in getting a hat that would never irritate the bees.

PRODUCING AND SELLING HONEY.

FRIEND WILTSE CONSIDERS THE MATTER A LITTLE.

“**N**OW much does a pound of honey cost?” is the heading of Mr. Doolittle's article in the May No. of GLEANINGS. “Selling honey,” is Mr. Hutchinso's. These two articles look well in print, and they help to fill the pages of GLEANINGS—two strong arguments with the editor of a journal, when items are scarce. With commendable zeal for the welfare of the fraternity, each has endeavored to impress his views upon the readers of GLEANINGS, and, so far as the writer is concerned, he is ready to admit the truthfulness of what they say, so far as it relates to themselves. The conditions under which these two men do business, and the circumstances that surround them, differ very materially from those that surround the masses of bee-keepers, and render that which is untruthful to many others, true to them. Mr. Doolittle has to pay cartage, and he has to pay rent for ground in which to establish his apiary. Most apiarists have vacant grounds near their houses, which they ornament by dotting their surface with hives of bees, and they generally keep teams to use in the pursuit of other lines of business, which they press into service when the interests of the apiary demand it. These teams would have to be fed and cared for if not in use, and are, therefore, of but little more expense to their owners than they would be if not used. Under unfavorable circumstances, no one can manage 100 colonies of bees successfully; and nine-tenths of those who can manage 100 colonies successfully when the conditions are favorable, would fail to attain a position paying a salary of \$1000 a year, for lack of the necessary qualifications. Owners of farms, in sections of country where the main honey-flow is in August and September, can employ their farm-hands in their apiaries during these months with little detriment to their farm interests; for their small grain is then harvested, and there is little to do. In June, when the flow of basswood honey is good, and the pressure of work great, some inconvenience arising from the labors of the apiary is felt. Ordinarily the occupation of apiarist approaches that of sinecure the closest of any known to the farmer.

SELLING HONEY.

But little charity enters into the business transactions of men. If the necessities of a man are such that he must sell a given article of any kind, advantage is taken of that necessity, and he is compelled to make it for the interest of the purchaser to handle the article, or no transaction will follow. If the salesman is inexperienced, it is at once known

to the person desiring to purchase, and still less is offered for the commodity. Under such circumstances a sale at reduced rates is generally made, and the party selling becomes dissatisfied with his business, and, naturally enough, he has allowed himself to be out-generaled, and his profits have passed into the hands of another. An experienced man of business should see at a glance the tendency that affairs are taking, and, being the boss of the situation, seek a place where business can be transacted to his own interest. Opportunities of this kind occur in every community, and the tact by which salesmen get the confidence of strangers is readily acquired. Probably the honey that Doolittle parted with at 6 cts. per lb. would have brought 10 or 12 cts. elsewhere. Probably the honey that Hutchinso put in his half-pint pails would have sold elsewhere as readily from a half-barrel.

OUR OWN EXPERIENCE.

From early childhood to the present time, we have been familiar with bees. Never have we known a time when honey could not be sold at remunerative prices. We have secured yields, varying from nothing to 122 lbs. per hive, and these variations are not due to any superior skill at one time, or lack of it at another, but principally to the favorable or unfavorable conditions under which the bees had to labor. We have noticed but little difference between the amount of honey stored in 1-lb. frames and the amount stored in boxes holding from 4 to 8 lbs., when the conditions were the same, and the honey sells as readily from the boxes, if they are allowed to return them after the honey is used. We realize 20 cts. per lb. for our comb honey, less a commission of 10 per cent. Our last year's crop was about 1600 lbs. comb honey, and 8000 lbs. extracted. The latter we put in half-barrels, 10-gallon kegs, and quart jars. The last retails at 60 to 65c. each. The honey in kegs we sell at from 12½ to 15 cts. per lb., furnishing the keg free, and sometimes paying freight, sometimes not. What we do not find sale for, which is the main part, we ship to various towns in Kansas and Nebraska, to be sold on commission, allowing 15 per cent. It retails at 12½ to 20 cts. per lb., varying in price as the distance from home varies, and as the freight varies. On the whole, after the freight and loss and commission are paid, we realize about 12½ cts. per lb.

JEROME WILTSE.

Falls City, Neb., May, 1884.

Friend W., we are glad to see you again. It sounds just like you, to intimate that articles for our pages are scarce, and that friends D. and H. have not given the subjects on which they write quite as much study as they might have done. Well, perhaps you are right a little, any way. I do not think friend D. pays any rent on his place, and I am inclined to think he has a team of his own; but for all that, the place and the team ought to pay something for the money invested, as they would if they were hired. Your thought, that farmers often take care of bees and the honey-crop when they would not do much otherwise is a good one, and I believe it refers to people in other kinds of business as well. A great many farmers and their wives and daughters spend quite a little time playing croquet, so as to get outdoor exercise; and many who keep bees—that is, on a small scale—occupy just about as much time with them as the others do with their games.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

CHOOSING A LOCATION BEFORE SWARMING, ETC.

In regard to bees hunting a tree for a home before they swarm, I say some of them do, as for instance, I had a swarm come out the first of June, and they never alighted, but started to the tree. I threw water, and that did not stop them; on they went, and I chased them to a neighbor's woods, and they went over their tree some ten rods, and turned down toward the ground, and went back to their tree, and went in. Again, I had two swarms come out together, and they went off southwest, and I followed them to a tree in sight of my house. There they divided; a part of one swarm went back to their old hive, and the rest went in the tree. Again, I found a lot of bees clearing out a tree, about 15 feet high from the ground, and shortly I heard a swarm come out and start for the tree. I stopped them with water, and hived them, and the next day they tried swarming again, and I stopped them and hived them again, and then there came a rain and kept them for two days, and then they stayed. But there was no swarm that went in that tree.

I should like to tell the folks how to find a bee-tree in the woods. When you line a swarm, and think you are close to them, or get a cross line of them, then look at the sun; take your line toward your tree; and every tree you look at, place the sun in the top, or behind the tree; and if there is a swarm in that tree, you can see them twenty rods off, in a clear day. Between ten and two o'clock in the day is the best time to hunt them. C. L. HANSEMAN.

Portland, Ionia Co., Mich., Feb. 11, 1884.

Friend H., you have given us evidence a little more conclusive in one part of it than we have ever had before, if I remember correctly. You saw the bees fixing the tree preparatory to going into it. They tried two or three times to go to the tree, but you prevented them, and afterward you found out that the tree was not occupied. Thanks for suggestions in regard to bee-hunting.

TOP OR SIDE STORING.

There seems to be a controversy as to which is the better way to have bees store honey—at the top or side. Quite a number of years ago I settled that point to my satisfaction. I got a theory or notion in my head, that if, instead of extracting from the upper story (as is the practice here), I would make the main hive larger, containing 18 frames with foundation, instead of 9, the usual number. I put a division-board in the center, put in a new swarm, and when the brood-nest was full I removed the division-board. I thought the bees would, of course, commence making honey sooner at the side in their own hive than in an upper story; but to test it I put on an upper story also; but to my surprise they filled the upper story before they put an ounce at the side. They say that one swallow does not make a summer; but I have tried the same thing time after time, with the same result, which proves to me that over the brood-nest is the place the bees prefer to put their surplus honey, and consequently the best place. JOEL HILTON.

Los Alamos, Santa Barbara Co., Cal., April 7, 1884.

Friend H., although I pretty nearly agree

with you, I do not think your experiment quite a fair one. If you give an upper story at the same time you give them room right beside the combs, of course they will go above, for the heated air from the cluster rises, and they naturally go up with it. Had you not permitted any room above at all, they would have been obliged to work each side. If you put a case over the brood-nest containing only a single tier of boxes, if the colony is strong enough to fill it completely with bees they will readily go over into boxes placed beside the brood-combs; and by this means we should get more boxes arranged so as to be all nearer to the center of the brood-nest than if we had the same number of boxes all above the brood, and this is the plan upon which friend Doolittle works. Our friend who writes below strikes upon the point you make.

If I take a three-story hive in the best part of the honey-flow, and raise it up, putting one under, will the queen lay eggs in the lower part, or will she go down into the lower story at all?

I would not give one dollar per hive to insure them to winter without loss. I bought me a pair of scales, and weighed all of my bees; and if I had not done so I should have had dead bees before this time, as some hives weighed 96, and one 41 lbs.; weight of hive, 33 lbs. I gave two full combs of honey to this one, and they feel as heavy as they did when I housed them. Now, when I set them out in the spring I will weigh them out, then I can tell you how much they wintered on. N. C. BANK.

Greenwood, Cass Co., Neb., Feb. 22, 1884.

Friend B., if you should raise up the three-story hive, and put a lower story under it, unless the colonies were very populous, very likely the lower story would not be used at all, for bees, as a rule, go up rather than down, as I said above. In fact, where too much room is given by piling up two or three stories high, the bees will often crowd into the upper one, leaving the lower combs entirely deserted. Your idea of using a pair of scales to equalize the weight of your hives is a good one.

BEEES KILLING EACH OTHER.

I had something happen to one of my hives last summer which I can not find in the A B C, and I wish you would help me out if you can. It is this: The bees were slaying one another at a terrible rate. At first I supposed it was robbers; but it was not, for I closed the entrance, and then they crawled the opening so full that they could not come out. There were no bees trying to get in; they were all trying to get out of the hive, and they would not try to fly, but crawl a little way from the hive and die. I smoked them, but it was no use; for as soon as the smoke was gone it was all the same.

SELLING EXTRACTED HONEY.

I see in GLEANINGS, on page 20, 1884, that A. A. Fradenburg can not sell his extracted honey. It is the same here. There is one man here who has spoiled the trade for honey. I have some put away that I shall send you, to let you see what he sells for honey. I sold all I have had so far for 25 cts. per pound, and I will not sell for less.

Sandusky, Ohio, Feb. 27, 1884.

F. SCHNECKE.

Friend S., it is a little difficult to explain what you mention, without being able to see

the bees themselves. The way they crawl out of the hive, looks as if they had been smothered. I presume you are sure that is not the trouble. Is it not possible some truant swarm forced their way in there, and that in stinging them to death they clogged the entrance and thus induced suffocation? I have known such things to happen.—I should infer that honey sold pretty well in your locality, if you get 25 cts. per lb. for all you can furnish. It is a fact, that one injudicious bee-keeper may do much to prejudice people.

USING OLD COMBS FOR NEW SWARMS.

I had very bad luck a year ago last winter; I lost 55 swarms; last winter I lost 35 swarms; have 10 left; they had the cholera. Will it do to give young swarms those combs? About one-half of them are half full of honey, capped over. I have about 400 combs. Could I not sell them? Two-thirds of them are clean nice brood combs. I have more than I can use. I am going to build up again. I shall not give up yet. You remember you were at my place once. I often think of you. Now, as soon as I can get a dollar to spare, I am going to send for GLEANINGS. I lost a good many swarms this spring by spring dwindling. Bees did well last summer here. One man, Mr. Roop, at Carson City, Mich., sold 15,000 lbs. He had 200 swarms. L. REED.

Orono, Osceola Co., Mich., May 13, 1884.

By all means, use your old combs, friend R.; and even if the bees did die from them, it will not often make a bit of difference. Several experiments have been tried, and though bees died on a set of combs one winter, they wintered all right the next, even though they had the same stores. I would, however, endeavor to get the old honey all used up in brood-rearing if I could. When I visited you in your pretty home in the woods I thought you were one of the successful bee-men. We are very glad indeed to get so good a report from our old friend Roop. Hiram, why don't you tell us about it when you are prospering?

HOW TO PREVENT INCREASE.

This question is asked in March GLEANINGS by A. Landley, page 168. I can give my plan, which probably would have to be varied in his locality. The principal part of our swarming is in July and August; surplus honey is stored in August and September. I give all the room and ventilation I can, shade as best I can, and all swarms that come out before they begin to store surplus honey, I hive on the old stand, moving the old colony to a new stand. This plan prevents after-swarms, inasmuch as the worker-bees go to the swarm. After surplus begins to come in, I hive the same way, except I just lift the old colony back 2 or 3 feet, and hive the swarm on foundation or starters. In about two days after hiving I lift out all the combs from the old colony, shaking the bees in front of the swarm; put on the sections, and they will be filled quicker than if the swarm had not issued. Now you have a set of combs to use; if you have any weak colonies you can strengthen them, or fill up your nucleus hives. If you have none of that to do, set the hive, comb, and all, on another colony, and extract from them.

One drawback in selling bees is, we don't want to sell at home on our own range; and to advertise, it

will take about as long to get a trade started as it does to create a home market for honey, for the reason that those who want to buy will almost invariably go to the old veterans. I tried it once in selling dollar queens. I sold 5 from advertising, and 60 or 70 to my personal acquaintances.

R. ROBINSON.

Laclede, Fayette Co., Ill., March 20, 1884.

WHAT SHALL FRIEND L. DO WITH SWARMS THAT SWARM AGAIN?

Please tell in GLEANINGS what I must do with my bees. Two swarms caught this year, one on the 19th of March, and the other on the 29th, are sending out swarms. I have at present 22 colonies, and do not wish to increase. The queens of the two hives had their wings clipped, and the bees had to come back. I gave them another story, and thought that all would be right; but one swarm came out again today. It clustered on a tree near by, and came back after a while. The other is quiet yet. They have plenty of room, and the honey is getting scarce, as I notice they are turning out drones. The swarms came out at least 8 or 10 days ago.

I have some bees in small hives (called the Dixie) that I bought this winter. I had intended transferring them in the Simplicity after they had finished swarming; but when that time came the high water was on us, and the hives were raised on a scaffold, and put rather close together for want of room. Since then the bees have filled their hives, and I can not extract on account of robbers, that are very bad, and I can not put on another story, as I have no hives nor frames to fit over those. I take GLEANINGS, and have derived much good from it. M. L. Bayou Heron, La., May 15, 1884.
